There are a whole host of federal statutes with which state and local governments must comply. That the federal government has the authority to regulate state as employers was established in *Garcia v. San Antonio Metropolitan Transit Authority* (1985), which held that the federal government can force state and local governments to comply with the Fair Labor Standards Act. The basic rule that the federal statutes are the supreme law of the land and bind state and local governments means that a whole host of statutes bind local governments, although the Supreme Court has limited this power based on the doctrine of sovereign immunity under the Eleventh Amendment. Thus, even though the Americans with Disability Act of 1990 is technically binding against the states, and the states and local governments must make their physical plants ADA compliant (*Tennessee v. Lane* 2004), there is no remedy for employees since employees cannot sue their state or local employer under this act (*Board of Trustees of the University of Alabama v. Garrett* (2001)). The same is true for the Age Discrimination in Employment Act of 1967 (*Kimel v. Florida Board of Regents* 2000).

In addition to the Fair Labor Standards Act, states and local governments must comply with statutes such as the Equal Pay Act of 1963, the Civil Rights Act of 1964, the Drug Free Workplace Act of 1986, the Family and Medical Leave Act of 1993, and many others. Additionally, federal rules based on the authority of these acts are also binding on the states. Perhaps the most significant of these would be the sexual harassment rules established by the Equal Employment Opportunity Commission in 1980.

## State Laws that Bind Local Governments and Home Rule

By virtue of Dillon's Rule, local governments are the creation of state governments. It is well beyond the scope of this essay to detail the thousands of state laws that limit the power of local governments to act. Unless a local government has home rule status, then that government can only do those things which the state constitution or municipal code allows. Thus, state law determines the legal standards and procedures for administrative hearings upon receipt of complaints of discrimination, unfair labor practices, or unjustified adverse job actions. Most states have some sort of human rights commission or public employee rights commission that has been established by state law and which establishes procedures and a hearing body for personnel complaints. Similarly, as mentioned earlier in this essay, rules governing collective bargaining are set by state law as well, with some state laws being far more favorable to labor organizations than others.

The concept of home rule is important with regard to the autonomy that a local government has to act. Local governments are classified as home rule if they have a home rule charter granted by the state legislature. In most states, local governments with populations above certain size standards are automatically considered home rule. Unlike non-home rule jurisdiction, which must be able to point to specific legal authority to engage in an action, home rule jurisdictions need only show that there is no state or federal

law prohibition against taking that action. In essence, the default answer to the question of "Can we do this?" is changed but that small status change is very meaningful.

## Conclusion

The legal constraints faced by public administrators are very real and require considerable attention. Access to corporate counsel should be available to make sure that laws are followed. Not only do basic constitutional principles limit the discretion of administrators, but the need to comply with a complex web of federal and state statutes and regulations creates a situation where public sector work experience is invaluable. The difference between running a private sector business and a public organization is large, and the successful public manager will understand that difference and hesitate before taking rash action that may be in violation of a statute or rule.

# Law Enforcement Profiling in Public Policy

Elizabeth Wheat
Public and Environmental Affairs (Political Science), University of Wisconsin, Green Bay, WI, USA

## Synonyms

Cops; Police; Stereotypes

## Definition

Law enforcement profiling: targeting individuals for suspicions of crime based on race, ethnicity, religion, or national origin.

## Introduction

Following a series of high-profile shooting incidents and aggressive police measures, departments throughout the country faced greater public scrutiny of their tactics including profiling measures and increased pressure from the public. This chapter will look at racial profiling, public perceptions of treatment by police, traffic incidents using racial profiles, and a series of case studies on profiling by police departments.

## Racial Profiling

The National Institute of Justice (NIJ) defines racial profiling as a practice that targets people for suspicion of crime based on their race, ethnicity, religion, or national origin (NIJ 2013a). A 2003 Gallup survey found that 59% of respondents felt racial profiling was common (Ludwig 2013). A fall 2015 poll from the Leadership Conference on Civil and Human Rights found that 57% of respondents opposed racial profiling with the highest opposition from African Americans (78%) and Latinos (72%) (Morrison 2015).

Twenty states have no laws prohibiting law enforcement from using racial profiling, 17 states require data on police searches and stops, and only 15 require data and publication of racial profiling data (Natarajan 2014). Thirty-one states have laws that address racial profiling in some context according to the National Conference on State Legislatures. Most of these laws mention data collection, but do not require it (Bolten 2015). The NAACP is working in states such as Iowa to push legislation requiring collection and analysis of data and for a ban on racial profiling. The specific Iowa legislation would require data collection on all types of stops, submission of these data to the state Attorney General, publication of the data, establishment of a Community Policing Advisory Board, required annual training for police officers on discriminatory policing practices, and guidelines for filing complaints and monetary penalties (Bolten 2015).

The Department of Justice's (DOJ) guide on legitimate uses of profiling recommends training, data collection, and accountability. However, the guide also states, "This Guidance does not apply to Federal non-law enforcement personnel, including U.S. military, intelligence, or diplomatic personnel, and their activities. In addition, this Guidance does not apply to interdiction activities in the vicinity of the border, or to protective inspection or screening activities" (Natarajan 2014).

In 2003, the Bush administration issued the federal government's first official policy on racial profiling. This followed a 2001 statement by President George W. Bush regarding racial profiling: "It's wrong, and we will end it in America. In so doing, we will not hinder the work of our nation's brave police officers. They protect us every day – often at great risk. But by stopping the abuses of a few, we will add to the public confidence our police officers earn and deserve" (DOJ 2003). The new DOJ policy banned profiling on the basis of race, but no other characteristics were included. To assist with increased post-9/11 concerns about airport and border security, the Bush policy included exceptions and allowed racial profiling when "preventing threats to national security" or when "protecting the integrity of our nation's borders" (Lind 2014).

On December 8, 2014, the Department of Justice (DOJ) updated the federal government policy on racial profiling to prohibit considering religion, national origin, gender and gender identity, or sexual orientation in choosing which individual to investigate. The new policy applies to all federal agents with some exceptions for border officers, but does not extend to state or local police departments. Profiling remains allowable "in the vicinity of the border" (Lind 2014).

One criticism of racial profiling is that it breeds suspicion between police and the communities they serve. Law enforcement groups criticize the policy as well, arguing it leads to minority citizens distrusting officers and therefore becoming less willing to assist with crime investigations (Morrison 2015). Fraternal Order of the Police leader Jim Pasco stated, "100% of the FOP believes that racial profiling is abhorrent. We have thought this for far longer than any poll [on it] has existed. We reject the premise that [racial profiling] is practiced systemically," Pasco said Monday. "We don't support a ban on the practice because it begins by finding that the practice is systemic. That could not be more false" (Morrison 2015).

## Perception of Treatment by Police

Public perceptions and trust in police vary widely by race with minorities more likely to distrust law enforcement and be suspicious of officers. This mistrust can undermine beliefs in the legitimacy of police and affect their ability to do their job effectively in the community (Horowitz 2007).

The National Institute of Justice's (NIJ) reports consistently find race is a predictor of attitudes toward the police (NIJ 2013a). A 2015 Gallup poll reported that African Americans were more likely to feel they are being discriminated against in many aspects of society including grocery stores, restaurants, and police during a traffic incident (Dunn 2015). There are many direct and indirect factors that influence perceptions of police, but personal interactions are one of the strongest predictors with an officer's "demeanor and actions" most important in how these interactions are viewed. Media coverage of police misconduct can also influence public perceptions, but not as strongly as personal interactions (NIJ 2014).

## Traffic Stops

A 2011 report by the Leadership Conference on Civil Rights argued their evidence demonstrated African Americans and Hispanics are targeted at higher rates for search and seizures by police, despite statistics showing they are less likely to have contraband or have committed a criminal act. In a study done in Illinois, whites were actually twice as likely to have contraband material (Natarajan 2014). Research from the NIJ found that individuals of color are more likely to be stopped than white individuals. The challenge has been determining how many of these stops were related to discrimination or other factors such as differences in driving patterns with major highways versus neighborhoods, differences in exposure to the police, or differences in offending (NIJ 2013b).

A DOJ investigation found significant racial disparities with traffic enforcement, and their national survey data found black drivers were more likely than whites to be pulled over within the last year (Lowery 2015). In a *Washington Post* database tracking deadly police shootings, more than 100 people were killed by police officers in 2015 during a traffic stop. One of three victims was black (Washington Post 2016; Lowery 2015). Black drivers are also more likely to be targeted for "investigatory stops" where officers are looking for drugs or executing a warrant. National Fraternal Order of Police Executive Director James O. Pasco said, "The two most dangerous things that an officer can undertake are responding to a domestic violence complaint and stopping a car. An officer making a stop has absolutely no idea in the majority of cases who is in the car or what their frame of mind is" (Lowery 2015).

One example of a questionable traffic stop involving racial profiling occurred in Georgia. After being stopped by police in Doraville in a case of mistaken identity, Gambian native Mbye Njie felt police profiling needed to be addressed in a new way. During this incident, officers said there was a warrant out for his arrest, but he found out 40 min later that there was no warrant. When Njie went to file a police complaint with his mother Dr. Catherine Meeks, the officers told them police profiling was legal. This stop was part of a series of stops for Njie, dating back to his time at Davidson College (Staples 2015).

Along with a few friends, Nije created a mobile app called Legal Equalizer that allows users to video their encounters with police. The app has an SOS button that sends an alert to three emergency contacts with the user's location and notification of a stop by the police. Links to relevant laws then appear. Users may also select a video recorder button to record the stop and send the footage to the three emergency contacts (Legal Equalizer 2016). Njie said, "The side of the road is not where you want to have an argument with the officer. You're going to lose every single time. The point of the app is to let people know their rights so that they can take their stand in the proper forum... I wish there was no need for it. It saddens me that we've gotten to the point where we need to record the people who are charged with protecting us but that's the world we live in now" (Staples 2015). Nije and his partners are seeking investors to update their app and hope to install it in every US car.

## Case Studies: New York Police Department (NYPD) "Stop and Frisk" and Eric Garner

When it first began, "stop and frisk" gave police the authority to stop and question (or search if

deemed necessary) any person they felt looked suspicious. The NYPD publishes their data from these encounters in the Stop, Question, and Frisk Report Database (NYPD 2016). The peak year for this policy's use was in 2011 when approximately 700,000 people were stopped (Parascandola 2016). Former New York City mayor Michael Bloomberg argued the "stop and frisk" policy was critical to effective law enforcement. It received criticism because African Americans appeared to be targeted more with over 50% of stopped individuals in 2012 being African American despite comprising 25% of the city's population (Horowitz 2015). Combined, blacks and Latinos were targeted 85% of the time under the stop and frisk policy (Natarajan 2014). Then-mayor Michael Bloomberg argued the results were due to black residents being involved in crimes at higher rates (Horowitz 2015). In 2013, Judge Shira Scheindlin ruled the stop and frisk policy violated the constitutional rights of minorities. In March 2016, a federal monitor appointed after Judge Scheindlin's ruling submitted a new form for NYPD officers to use that, if approved, will require officers to explain in detail why they conducted a stop (Parascandola 2016).

In addition to the contentious stop and frisk policy, NYPD's police tactics drew national criticism after the July 17, 2014 death of Eric Garner. In a case of controversial police techniques, the NYPD approached Eric Garner for a petty crime of selling loose cigarettes, a crime for which black individuals are targeted at a higher rate (Natarajan 2014). When they proceeded to use a banned chokehold technique to arrest him, Garner died in police custody. A cellphone video of the confrontation and Garner's final words "I can't breathe," repeated 11 times, led to national outcry and demand for review of the NYPD. The Richmond County jury chose not to indict the lead officer, but the DOJ announced an independent investigation (Baker et al. 2015). Shortly before the 1-year anniversary of Garner's death, the City of New York reached a $5.9 million settlement for a wrongful death claim with Garner's family (Goodman 2015).

Garner's death, in addition to subsequent police killings of Freddie Gray (Baltimore), Michael Brown (Ferguson), and Walter Scott (North Charleston) led to more than 50 rallies calling for greater scrutiny of law enforcement treatment of black men and played a role in motivating the national Black Lives Matter movement. As more information was released about Garner's death, a series of errors and abuse by NYPD were discovered (Baker et al. 2015). His death led to further allegations of excessive force within the NYPD and other departments in Seattle, New Orleans, Portland, Newark, Albuquerque, and others (Natarajan 2014). In response to the policy and public pressure, the NYPD created a new unit titled the Force Investigation Division that will investigate future fatal encounters with police. It still refuses to release its investigative file on Eric Garner despite legal requests by the Civilian Complaint Review Board (Baker et al. 2015).

## New Jersey

New Jersey was the first state where race-based arrests and searches were considered crimes (Ludwig 2003). An American Civil Liberties Union (ACLU) study of four New Jersey cities (Jersey City, Elizabeth, New Brunswick, and Millville) from 2005 to 2013 found that blacks were two to ten times more likely to be arrested for petty crimes such as marijuana possession, disorderly conduct, defiant trespass, and loitering than white offenders. Data from Jersey City showed the greatest disparity; black residents were five times as likely to be arrested on average than white residents with the gap growing to ten times as likely by 2013. Two of New Jersey's law enforcement agencies have been under federal oversight and monitored by the DOJ for discriminatory policing, and a separate ACLU report found stop and frisk in Newark disproportionately targeted residents of color (Sullivan 2015; ACLU-New Jersey 2015).

To improve data limitations, the ACLU's 2015 report recommends New Jersey and other police departments to keep arrest data in an accessible and reliable format, report data for low-level offenses, and report data on stop and frisk searches of pedestrians and vehicles. It also

supports developing enforceable racial profiling laws such as New York City's where protected categories of persons include age, gender, gender identity or expression, sexual orientation, immigration status, disability, and housing status. Finally, the report recommends independent oversight of police enforcement agencies and creating a body such as a Civilian Complaint Review Board (CCRB) to examine allegations of officer misconduct and an Inspector General Office (IG) for monitoring of police policies (*Selective Policing–racially Disparate Enforcement* 2015).

## Maryland

Law enforcement agencies in Maryland are required to have policies prohibiting racial and ethnic profiling. In August 2015, Maryland became the first state to expand on these policies in response to new profiling policies announced by the DOJ. The new guidelines do not allow officers to profile suspects on characteristics including race, ethnicity, national origin, identity, disability, religion, and sexual orientation (Stolberg 2015). The Attorney General's memorandum on the new policies prohibits any profiling while "conducting routine police activity," and these personal characteristics may only be considered if officers have "credible information" that the characteristics are "directly relevant" to a criminal investigation. Maryland's actions have been praised by civil rights advocates such as ACLU Maryland, and the Center on Race, Crime, and Justice hopes other states follow the lead (Stolberg 2015).

## Los Angeles Police Department (LAPD)

Department rules prohibit officers from using "race, color, ethnicity or national origin, gender, gender identity, gender expression, sexual orientation or disability. . .in conducting stops or detentions" unless the stop is required for a specific investigation. Stops should "be unbiased and based on legitimate, articulable facts, consistent with the standards of reasonable suspicion or probable cause. . ." (Banks 2015). A 2008 study of LAPD data showed blacks were stopped, frisked, searched, and arrested at significantly higher rates than whites, controlling for residence in areas with high crime (Christensen and Hamilton 2015). Of the 1,356 complaints of racial profiling from 2012 to 2014 against the LAPD, none were considered valid by the department (Garza 2015; Mather 2015; Inspector General, Police Commissioner 2015).

President Matt Johnson of the Police Commission, a civilian oversight group for the LAPD, commented, "I don't think anybody believes there are actually no incidents of biased policing" (Banks 2015). Commissioner Robert Saltzman stated, "While no doubt the vast majority of LAPD officers do not engage in biased policing, it strains credibility to suggest that. . .there were zero instances of biased policing. It should not be surprising that there is diminished trust in the LAPD given these results" (Mather 2015). Craig Lally, LAPD union chief, views the problem in a different way than the Police Commission. He said, "Whether it's their belief or their impression, I can't change that. I feel sorry for those people who got stopped 20, 30 years ago and it probably was racial profiling. . .Bu I would guarantee that stuff isn't going on now. . .Unless you get in the head of the officer who does the stop, how are you going to prove what the reason is?" (Banks 2015).

In Los Angeles, as in many other cities, the civilian oversight authorities are advocating for officers to wear body cameras and attend implicit bias training. Professor Melina Abdullah of California State-Los Angeles commented, "This will provide additional data. If I were law enforcement I'd think of it as an opportunity to demonstrate that I wasn't racially profiling, that we have a fair and equitable system. The resistance to it signals to me and many others that there is a lot of racial profiling going on" (Christensen and Hamilton 2015). Police Commissioner Johnson hopes the number of racial profiling complaints will decrease once this occurs. Union chief Lally

disagrees, "Everybody thinks 'you've just got to train those guys better. . .. Police officers come from the pool of citizens. . . They've got these perceived biases locked in. You think they go to an 8-h training and it's going to be cured? . . . You've got to do that when they're 5 or 6 years old. We're not robots, we're human beings" (Banks 2015).

In October of 2015, Governor Jerry Brown signed AB 953 requiring law enforcement to provide data on demographics from all civilian interactions. For anyone stopped, officers have to include "perceived" race and ethnicity, the reason the individual was stopped, and whether the officer made an arrest (Christensen and Hamilton 2015). President of the Long Beach Police Officers Association, one of many law enforcement organizations that had requested a veto of the legislation, responded to the bill's passage saying, "There is no racial profiling. There just isn't. There is criminal profiling that exists" (Garza 2015; Christensen and Hamilton 2015).

## Oklahoma

Oklahoma state law classifies racial profiling as a misdemeanor and defines it as "the detention, interdiction or other disparate treatment of an individual solely on the basis of the racial or ethnic status of such individuals" (Adcock and Robson 2015). Over 4 years, the state's two largest police departments received 62 complaints against police officers for racial profiling. None of these allegations were substantiated by investigators. William Citty, Oklahoma City Police Department Chief, explained, "Bias-based complaints are difficult to prove. Most of them are merely 'the officer stopped me because of my race.' Unless the officer says something to the complainant to indicate the stop is racially motivated, then they are hard to prove, because the officer will usually have a justified legal reason for the contact" (Adcock and Robson 2015). The police chief is hoping body cameras and new technologies will help reduce the number of bias complaints.

## Border Profiling

Jurisdiction of federal agents in US Customs and Border Control is within 100 miles of the national border including coastlines and/or "vicinity of the border" which could be different than the 100 miles depending on the agency's interpretation (Lind 2014). Agents have the authority to search at and between ports of entry, to interrogate, and to arrest for immigration or non-immigration offenses (American Immigration Council 2012). A 2000 Ninth Circuit Court of Appeals opinion banned racial profiling by border agents in California and Arizona (Weinstein 2000). The extent to which this ban is being followed is strongly debated.

In Texas, data from DPS troopers found that Hispanic drivers were 33% more likely to be stopped than Caucasians and much less likely to have any drugs, weapons, or illegal currency on them (Casares 2015). Representative Beto O'Rourke (D-Texas) criticized racial profiling at the border saying, "How can race help a Border Patrol agent or customs officer do a better job in a city like El Paso, where 85% of the people are Hispanic?" American Civil Liberties Union Director Cecillia Wang stated that though these border stops may be brief, they are disruptive and intrusive in the lives of citizens in the area. She argues, "For people who live in these border communities, you're going to get stopped all the time. It's not a minimal intrusion to have Border Patrol stopping you constantly, when you're trying to drop your kids off at the pool, or go to work, or go to the grocery store, or whatnot" (Lind 2014).

In late 2014, the Obama administration announced its intent to issue rules and limit the use of relying on broad stereotypes for racial and ethnic profiling while still allowing federal agents to consider race and ethnicity in stops at airports, borders, or immigration checkpoints. They will expand the definition of racial profiling, adding religion, national origin, gender, sexual orientation, and gender identity. Law enforcement will not be allowed to consider these factors or race

when pursuing criminal investigations or routine immigration cases. The administration also proposes to remove the national security exemption for using these factors, as advocated by now-former Attorney General Eric Holder (Apuzzo and Schmidt 2014).

The proposed changes received resistance from the Department of Homeland Security (DHS) who argued these factors were important to consider when searching for illegal immigrants and border enforcement. A DHS official commented, "The immigration investigators have said, 'We can't do our job without taking ethnicity into account. We are very dependent on that.' They want to have the least amount of restrictions holding them back" (Apuzzo and Schmidt 2014).

## Midwest United States Case Studies: Milwaukee, Chicago, and Cleveland

The 1994 Violent Crime and Law Enforcement Act authorized the DOJ to investigate entire law enforcement agencies in situations with excessive force or racial profiling (Childress 2015; Frontline 2016). This statute has led to investigations in Maryland, Ohio, and Missouri, with departments in Cleveland, Miami, and New York coming under investigation twice. Excessive force has been the most common complaint, followed by discriminatory policing. For these investigations, the DOJ can threaten a lawsuit unless the police department agrees to implement reforms. The strongest agreement and one advocated by the Obama administration is the consent decree: a binding agreement enforceable in federal court and often with independent monitoring and oversight. Detroit, Seattle, Cleveland, and Albuquerque police departments have all made recent agreements with the DOJ (Childress 2015; Frontline 2016).

One example of a reform is found in Milwaukee. The DOJ's Community Oriented Policing Services (COPS) and Milwaukee Police Department (MPD) announced plans for a "collaborative reform initiative" in December 2015. This program will evaluate the MPD's policies, practices, and accountability systems over 18 months and then present a public report with recommendations for changes. The DOJ hopes this independent evaluation will help reform the law enforcement agency and local politicians. Milwaukee Democrat Rep. Gwen Moore expressed her support,

> I am encouraged by Milwaukee Police Chief Edward Flynn's decision to request this investigation and I am hopeful that the recommendations made by the U.S. Department of Justice will help the Milwaukee Police Department better serve our community. Given the number of high profile incidences in my district, including the deaths of Dontre Hamilton and Derek Williams, change in our current system is long overdue. We must do everything we can to strengthen the relationship between the citizens of Milwaukee and those who have sworn to protect them. (Wisconsin Gazette 2015)

Chicago's situation differs. Following several high-profile police shootings of unarmed black men in October 2014, and contradictory reports from law enforcement, Attorney General Loretta Lynch announced a DOJ investigation of the Chicago Police Department (CPD) in December 2015 (Frontline 2016). The investigation will look for unconstitutional policing by CPD officers, specifically use-of-force violations (including deadly force) and disparities in treatment based on race and ethnicity (Childress 2015).

In Cleveland, there were a series of use-of-force events with the Cleveland Police Department that led to the DOJ opening an investigation on March 14, 2013 into allegations of excessive force and discriminatory policing (Frontline 2016). State Attorney General Mike DeWine referred to an investigation into one of the incidents as "a systemic failure. . .[where] the system failed." In December 2014, the DOJ's report found the public's concerns were "well-founded," that there was reasonable cause for thinking the department using excessive force and that this excessive force had been used against mentally ill individuals. The DOJ concluded, "The Cleveland Police Department had structural and systemic deficiencies in training, policies,

accountability, and community engagement that contributed to the problem" (Frontline 2016). Mayor Frank Jackson disagreed with the DOJ, but the city entered into a consent decree on May 26, 2015 to appoint a civilian head of Internal Affairs (IA) and create an inspector general with the power to analyze IA cases and investigate department policies.

## Future Steps for Law Enforcement

As Los Angeles and other cities have done, adding antibias programs and body cameras may help improve relations between officers and civilians by training the officers about their potential biases and providing visual documentation of encounters. After a trial run of a few months in Los Angeles, civilian Police Commission President Johnson said over 90% of officers and civilians were satisfied. "The officers sincerely believe: I was not acting in a biased way.' The community says: 'I have a better understanding of the officer's perspective.' Then there's a lot of 'I see how I could have done things differently' on both sides. I think that's better than any training we've got" (Banks 2015).

## Conclusion

Local, state, and federal reforms are necessary to address the problem of racial profiling by law enforcement. As the NIJ argues, racial issues with policing cannot be solved by the police alone (National Institute of Justice 2015). Societal challenges of economic and social conditions of unemployment, poverty, housing segregation, inadequate health care, homelessness, and poorly financed public services must also improve. With citizens and policy leaders working to better their communities and law enforcement seeking to reform its tactics, police departments and citizens have the potential for improved relationships with less dangerous confrontations that put everyone at risk.

# Lawmaking and Public Administration

Edward J. Miller
University of Wisconsin-Stevens Point, Stevens Point, WI, USA

## Synonyms

Implementation; Legislative-executive relations; Oversight

## Definition

Administrative discretion: flexibility that administrators have in carrying out a law.

Implementation: applying laws that have been enacted by the legislature.

Legislative veto: where the legislature gives an agency discretion to enact rules, but before they go into effect the legislature retains the power to halt their implementation.

Oversight: supervision and review by a legislature of the executive, including administrative agencies, and the court system.

Presentment clause: constitutional requirement that all bills and resolutions be signed by the president.

Signing statements: remarks made by the president when signing a bill as to how the law will be interpreted. Very controversial during the administration of George W. Bush.

State attorneys general: typically an elected official whose office represents the state in legal actions. Especially controversial in filing suits with other states against private companies and the federal executive.

## Introduction

Lawmakers at all levels of government enact statutes authorizing programs and appropriating funds for their implementation, but it is up to the administrative units in the executive branch to carry out these policies. This relation would seem to be straightforward, but enacted policies lack the detail necessary to direct implementation completely. Thus, executive agencies promulgate rules, which typically far exceed the number of pages of the law itself. For example, the Affordable Care Act provided incentives for health institutions to create Accountable Care Organizations (ACO), whose purposes are to improve the quality and reduce the cost of health care. To implement the ACO section, the Centers for Medicare and Medicaid Services had to issue rules, which they did in about 600 pages. The question is always raised whether the administrative rules distort the purposes of the original law. A continuing dialogue between lawmakers and administrative personnel occurs on this very point.

## The Legislative Veto as an Attempt to Control Implementation

One way legislators have attempted to control the administration of laws is to incorporate a legislative veto provision in the legislation, which requires rules to be submitted to the legislature or to a committee, allowing the lawmaking body to void the rule before it is implemented (Woods 2015). On the national level, the Supreme Court in the case of *Immigration and Naturalization Service v. Chadha* (1983) required that legislative nullification of rules must be done by a joint resolution, allowing the president to veto the legislative veto, and not by a simple or concurrent resolution, which does not need the president's signature. This complicated matters because if the president vetoed the joint resolution, the Congress would have to override the president's veto by a two-thirds vote. The basis of the Supreme Court's decision is the "presentment clause" of the Constitution, which requires all legislative action to be presented to the president for signature or veto (US Constitution, Art. I, Sec. 7). While some state high courts have similarly ruled against legislative vetoes for their state legislature on the basis of their state constitution, others have not. In Wisconsin, for example, a number of rules must be submitted to the Joint Finance Committee or

the Joint Committee on Employment Relations before their implementation. The committees can decide to nullify the rules.

## Legislative Oversight of Administration

Once rules are promulgated, legislators are vitally interested in their implementation, a legislative function known as oversight (Foreman 1988). The Congress made explicit the importance of oversight when they overhauled the committee system in the Reorganization Act of 1946, when they wrote that committees shall "exercise continuous watchfulness of the execution by administrative agencies concerned of any laws, the subject matter of which is within the jurisdiction of such committees." More recent committee reorganizations simply repeated this mandate with greater verbiage. To assist committees in carrying out this function, they not only have their own staff but also rely upon the Government Accountability Office (GAO), the Congressional Research Service (CRS), and the Congressional Budget Office (CBO). It is now typical that enacted legislation includes a provision mandating review of the program by one of these legislative agencies (Mosher 1979).

While not as elaborate as on the federal level, state legislatures have similar agencies, commonly called the legislative reference bureau, the fiscal bureau, and the audit bureau. Typically, less oversight is carried out in the states because most state legislatures remain part-time, even in those states that do not have a constitutional or statutory limit as to the number of days in session. However, even when committees are not engaged in explicit oversight of executive agencies, oversight is still being done as a by-product of considering policy and the budget.

Oversight has multiple purposes as legislatures review the administration of laws. Chief among these is to ensure that executive agencies are carrying out the legislative intent of the enacted policy. Equally important is the effectiveness of the policy in confronting the problem on which it is focused. While radical changes in policy are atypical, legislative review of a law frequently leads to incremental changes to make it more effective and to confront circumstances unforeseen in the original passage of the law. Besides examining whether implementation is meeting the goals of the policy, lawmakers attempt to discern whether the administration of the law is being done efficiently. One possible outcome may be a reorganization of the administrative structure, which could incorporate bringing in an outside consulting group. One example is when a state is considering transforming its employees' health insurance from private insurance companies to a self-insured system, paralleling the trend of larger private companies, the legislature will call for a private consulting group to assess the actuarial soundness of such a move and to suggest alternative administrative arrangements. Additionally, legislatures will investigate executive agencies for unacceptable bureaucratic behavior such as corruption and conflicts of interest. Overall, oversight allows lawmakers to provide discretion to administrative agencies without enacting overly detailed and controlling legislation but ultimately maintaining control over policy (Aberbach 1990; Huber and Shipan 2002).

While oversight is important, there are significant disincentives to carrying it out. First is the time needed to do oversight. While members of the Congress do have more time than state legislators, they still find it difficult to incorporate it in their routines. Most importantly, lawmakers may have established relations with personnel in administrative agencies that benefit them in affecting policy in their districts and in their effort to help their constituents with problems that they are having with administrative agencies (casework). A particular disincentive is when the president or governor is of the same party as the legislative majority. There are both political pressure from the administration for lawmakers to keep their hands off of their actions and a desire not to embarrass their party, which could have major ramification in a competitive party environment (Scher 1963; Ogul 1976).

On the other hand, lawmakers are more likely to engage in oversight when the legislative majority is of a different party from that of the chief executive. The Congress's extensive investigation of the State Department's role in preventing and

responding to the attack on the consulate in Benghazi, Libya, where several foreign service offices and the US ambassador to Libya were killed, is an extreme example of what can occur under a divided control situation. Another circumstance often leading to oversight is when the administration makes a significant change in the interpretation of a law. Thus, when the George H. W. Bush administration attempted in 1990 to declare minority scholarships as discriminatory, a congressional committee held hearings on that policy change, ultimately leading to a reversal.

## The Budget: Executive-Legislative Interaction

Of the items considered by the Congress, state legislatures, and local councils, the budget is among the most important. The funding level for various programs determines the extent to which they will be carried out (Kettl and Fesler 2009). To halt a program, lawmakers may provide zero funding, which would leave the law on the books but halt the program. While the budget typically focuses on funding, legislators may also direct agencies in their carrying out of policy by incorporating substantive language in the budget document. Legislators, elected by the people, do this to effectuate their conception of the program rather than the way the administration sees it. On the national level, the president can only veto the entire budget to avoid having provisions put into law. Thus, to negate the provision that money allocated cannot be spent for Planned Parenthood, President Barack Obama had to veto the entire appropriation. Most governors have a bit more flexibility than the president because of their power of the line-item veto, which still would require them to negative an entire section. Only Wisconsin gives its governor more power with its "partial veto" where the governor can make major changes in bills passed. In Wisconsin, this is enhanced by the inclusion of most of the governor's substantive programs in the budget itself. Most other states restrict the budget to financial matters with the governor submitting recommended legislation with individual bills.

## Administrative Discretion and Lawmaking

A continuing tension between lawmakers and the administration is whether the executive is overstepping that which is authorized by the legislature (Ethridge 1985). Republicans in the Congress have charged President Barack Obama with exceeding his authority in administering the Affordable Care Act, in deferring prosecution for certain groups of undocumented immigrants (particularly those brought to the USA as children by their parents) and in setting carbon emission rules for power plants. Besides holding numerous hearings on these issues, members of the Congress along with several Republican state attorneys general have filed legal action against the administration in the hopes that the courts will stop the executive action, ruling that the administration exceeded its authority.

The height of executive action, ignoring the will of the Congress, occurred during President George W. Bush's administration. Bush extensively used "signing statements," which are proclamations made at the time he signed a bill giving his interpretation of the legislation and stating which parts the administration would not enforce. The theory the Bush administration used to justify their actions was that the president had vast powers to do what he feels as necessary within the strictures of the Constitution, known as the "unitary theory of presidential power." The American Bar Association issued a report in 2006 declaring that signing statements were unconstitutional and a violation of executive power.

Beyond these noteworthy instances, bureaucracy exercises discretion every day in promulgating rules, typically following procedural safeguards which for the national government are laid out in the Administrative Procedure Act, and in carrying out their duty. Police, for example, do not carry out all laws to the letter and exercise enforcement discretion. Law enforcement may decide not to arrest all drug users if they see it more important to get information to arrest the drug dealers. Similarly, President Obama invoked prosecutorial discretion in deciding which undocumented immigrants were to be held for

deportation. Given the funding and personnel levels, it is clear that the USA could not deport all 11–12 million undocumented immigrants. Therefore, he decided that those brought here as children and their parents, if they had not committed a crime, would have prosecution of them deferred and that they would be allowed to work in the USA legally. However, Obama believed that his discretion did not extend to giving these individuals permanent residency, i.e., a "green card," which only the Congress could do by legislation.

## Implementation

The connection between an enacted law and its implementation by an administrative agency may be weak. The complex relationship can be partially explained by focusing on several critical factors. First, a new policy must be communicated accurately and clearly to bureaucrats. Complex policies, vague or nonspecific authorization language, and poor hierarchical communications within an administrative agency are all reasons for communication failure that would impact implementation. Additionally, administrative agencies must have sufficient resources to implement policy. The lack of expertise, staff, facilities, or authority is a resource factor that inhibit transforming legislative enactments into implemented policy. An agency's personnel's opposition to the policy and their need to attend to multiple priorities could be a wall inhibiting implementation. Likewise, the organizational structure of agencies, including bureaucratic fragmentation, routinization, and even merit system insulation could be roadblocks to full implementation. It may be difficult for higher-level supervisors to get street-level bureaucrats to carry out policy as intended by policy-makers (Edwards 1980).

A particular complex set of implementation challenges occurs when a policy involves more than one level of government. Federal goals may run into state and local values. Many federal programs, such as Medicaid, highways, and child nutrition, are administered by state and local governments (Kettl and Fesler 2009). While there are federal regulations, mandates, and guidelines, each state and local government will carry out the program a bit differently. The national government may only exercise weak controls over implementation. Often states will request specific deviations from federal rules, known as "waivers." These could distort the policy that lawmakers intended. This is the situation in several states, e.g., Indiana, with the Medicaid expansion under the Affordable Care Act. The connection between policy and implementation could be furthered muddled when implementation is farmed out to private contractors, a common occurrence.

## Conclusion

Government policy is enacted by the representative body, be it the Congress, state legislatures, city councils, or other, often elected, boards (e.g., school boards). However, policy is not self-implementing, leading to the importance of administrative bodies in determining what is actually done. These organizations decide on rules, providing the detail of implementation, and have a significant degree of discretion. Born of these twin functions are interactions between the rule makers and rule implementers, which often is a government agency but could be a private profit or nonprofit firm that has been contracted by government to carry out legislative policy and often to provide the service. When implementation does not conform to what policy-makers perceive as their intent, when it results in inefficiencies or corruption, and when outcomes do not match policy goals, conflicts arise between legislators and implementers.

# Laws and Crisis Management

Saptarishi Bandopadhyay
Osgoode Hall Law School, York University, Toronto, ON, Canada

## Synonyms

Disaster management cycle; Economic development; Risk management

## Definition

Law denotes a regime of agreed-upon rules and regulations that guide personal and societal behavior in specific instances. Laws are passed by legislative bodies at various levels of national and international governance. Crisis management occurs when an unexpected negative event impacts a community, and societal entities such as governments, businesses, and nonprofit organizations intervene to save lives, prevent further damage, and initiate recovery actions.

## Introduction

Disaster management may be sketched as an emerging body of rules, governmental and intergovernmental institutions, knowledge domains, and expert practices directed at securing society against the risk and occurrence of social disorder not directly associated with armed conflict. For the most part, the process of disaster management unfolds through strategies of technocratic regulation, and the calculations of experts spread across disparate fields of specialization (including the social and natural sciences as well as professional fields such as law, engineering, medicine, and so on). The rules, governmental/intergovernmental institutions, and expertise constituting disaster management concern themselves with emergency response, disaster preparedness (i.e., precautionary and preventive functions) and post-disaster relief and reconstruction (i.e., remedial functions).

The primary goal of legal regulation within this field is to target deep vulnerabilities in society, the continued presence of which would make the occurrence or recurrence of disasters inevitable. This holistic approach to disasters began with the insight that there is no such thing as a purely "natural" disaster (Bankoff 2010); while "hazards" may be unforeseen and natural, "disasters" are the result of preexisting and detectable background vulnerabilities within a given society ranging from endemic poverty and malnutrition to inadequate infrastructure, political corruption, technological failure, and the lack of social safety nets.

Starting in the 1980s, international institutions such as the United Nations and the Red Cross globalized this holistic approach to disasters by placing preparedness (or anticipatory disaster risk governance) (United Nations 2011) and economic development at the heart of disaster management best practices (United Nations 1987, 1989). The resulting approach is often conveyed through the image of the "disaster management cycle" which consists (with some semantic variations) of the successive stages of preparedness, relief, and rescue, followed by reconstruction, development, and mitigation (in turn, flowing back into the

preparedness phase). The relative success or failure of a society at each stage of the disaster cycle is described in terms of said society's "vulnerability" (or *at-riskness*) or as a measure of its "resilience," usually defined by adaptation and economic growth. Under this scheme, disasters may be said to occur when a hazard overwhelms the response capability of a society and causes "a serious disruption" of its everyday functioning (United Nations 2009). Detailed analyses of emergency management cycles may be found in other entries in this volume (for instance, "Disaster Response," "National Incident Management System," and "Natural Disaster Management"), and key terms are elaborated in "Crisis, Emergency, Disaster, and Catastrophe Defined."

## Law as a Background Condition of Disasters and Their Management

The perennial and holistic approach to disasters underscores the role of law in disaster management particularly in relation to economic development and risk regulation. The success of each stage of the disaster management cycle, for instance, is underwritten by a variety of legal rules, principles, and practices straddling multiple fields of legal expertise such as environmental regulations, human rights and humanitarian law, tort law, insurance law, administrative law, as well as codes and regulations related to property, housing, food, and healthcare, to name but a few. These well-established fields, in turn, implicate a wider range of issues located at the nexus of law and technology and law and society. Legal rules, regulations, and practices shape the crucible within which social life, with its myriad conveniences and injustices, prevails; the legal system not only empowers people and affords their rights and capabilities but can also disempower them by deepening existing social hierarchies and related inequalities. The most mundane functions of law intimately curate the everyday experiences and expectations of people in a given society, and, as such, they serve as both constitutive and remedial mechanisms. Of course, law is not the only frame of reference through which disasters are understood and responded to. But even other interpretive contexts such as class, culture, and political economy interface with the law because the work of disaster management is inevitably tied to notions of necessity, justice, foreseeability/responsibility, sustainability, and morality. The centrality of legal regulation to the process of disaster management has even inspired some scholars to define disasters in terms of the kinds of governmental responses and legal tools these situations demand, namely, those identified in the disaster cycle model (Farber et al. 2010).

The occurrence of a disaster not only tests the existing legal regime, laying bare its strengths, deficiencies, and ideological underpinnings, but in many cases may be directly or indirectly caused by the regime itself (Lazarus 2007). The problem is compounded because disaster management implicates a multitude of legal regimes, each with its own specialized practice, culture, biases, agendas, and informational limitations; as such, any given legal regime may fail to appreciate the dangers of advanced, interconnected technologies, be hamstrung by political and legislative rigmarole, be controlled by influential (private) actors, or be mired in confusion regarding the distribution of responsibilities. While some scholars argue that such a complex situation could benefit from a specialized field of "disaster management law," there is little consensus on the issue.

The emergence of a legal regime dedicated to disaster management is further troubled by jurisdictional concerns. Since disasters often have transboundary causes (e.g., pollution) and impacts (affecting more than one community, state, or country), since the mid-1980s, there has been a concerted effort by intergovernmental institutions to standardize disaster management practices across the world. At the same time, the transboundary nature of disasters has highlighted a significant tension between the formal role of sovereign governments as the primary guardians of their respective societies (United Nations 1987, 2011) and the actual ability of such local authorities to prevent the occurrence of a disaster and its impact across territorial borders. Nevertheless, governments continue to be the primary sponsors

of such efforts, and the sovereign state remains the centerpiece of a growing framework of multilateral treaties and international legal principles and practices on the subject.

## The International Legal Regime

During the late nineteenth century, the Red Cross was one of the first institutions to attempt to develop an international legal regime of disaster management. In the aftermath of World War II, states began to develop bilateral and eventually multilateral agreements to coordinate relief and rescue efforts between themselves. During the 1960s, the United Nations served as a clearing house through which member states could make and offer disaster relief and aid. These efforts, however, were largely ad hoc and usually only activated upon the occurrence of disaster. The contemporary model of international disaster management (deploying a perennial and holistic approach) gained traction during the 1990s under the leadership of the United Nations which declared this period as the "International Decade for Natural Disaster Reduction." As part of this effort, the United Nations established the Office for the Coordination of Humanitarian Affairs and a number of subordinate committees and agencies, while the Red Cross and other non-governmental institutions promoted the Sphere Project dedicated to standardizing international relief efforts across the world.

Over the next two decades, a variety of general and specialized treaties have emerged tying states in an expanding web of aspirations and obligations related to various factors that contribute to the occurrence and prevention of disasters including law reform, economic development, sustainability, and climate change (United Nations 2005, 2015). There have also been efforts to supplement these formal agreements by elevating the legal character of some norms, such as the "responsibility to protect" (drawn from international criminal law targeting large-scale massacres), so they may be binding on all states irrespective of their consent (ICISS 2001); a breach of these obligations could offer a justification for humanitarian intervention. However, states have been reluctant to allow what could prove an untenable restriction on their sovereignty, and the legality of military intervention remains controversial.

A parallel strain of efforts, for instance, the Red Cross' "International Disaster Response Laws, Rules and Principles" (IDRL), is directed at offering technical assistance to sovereign governments and encouraging them to bring national and local preparedness and response capacities in line with international best practices. States amenable to this approach generally promulgate a comprehensive legislation on disaster management and establish a central (public) agency to coordinate relief and reconstruction operations across governance sectors. This approach is also commonly accompanied by the implementation of an array of legislative changes and the lowering of regulatory barriers related to property rights, travel visas, and work permits, as well as taxes, duties, and customs clearances to facilitate international aid and relief efforts in the aftermath of disasters (Red Cross 2010).

In the recent decades, the uptake of international standards at the national level has been matched by the harmonization of disaster mitigation efforts at the regional level, including interstate institutions across the Caribbean and Latin America, the Middle East and North Africa, as well as South and Southeast Asia. These alliances have promoted the further standardization of legal rules relevant to disaster management: for instance, following the 2004 Indian Ocean tsunami, the Association of Southeast Asian Nations (ASEAN) adopted a pioneering Agreement on Disaster Management and Emergency Response, spurring a trend which has produced a number of similar accords, and most recently the 2016 Doha Declaration on Strengthening Disaster Law Frameworks in the Middle East and North Africa. These accords generally adapt IDRL guidelines to local and regional needs and constraints. Each such agreement is designed to establish as a cooperation and knowledge-sharing framework for member states covering issues such as risk identification and mitigation, research and development of early warning mechanisms, preparedness and response strategies and protocols, as well as post-disaster aid and rehabilitation.

In addition, international financial institutions such as the World Bank and the International Monetary Fund (IMF) and a multitude of non-governmental organizations have emerged to enact globalizing best practices through myriad education and awareness campaigns. Unsurprisingly, the legal regime(s) addressing disaster management at the international level remains diffuse in character to the extent that the Red Cross has described it as "the world's largest unregulated industry" (Red Cross 2005, p. 93). This diffuse but globalizing character has, in turn, raised a variety of ethical concerns and the consequent development of "codes of conduct" and "minimum standards" that foreign aid workers and United Nations Peacekeeping Forces must meet in order to ensure that local stakeholders are not displaced or overrun by their presence on the ground. Nevertheless, the field of disaster management remains rife with controversy (Kennedy 2005): recipient states and their people often suspect international interventions of pseudo-colonialism and accuse them of facilitating the economic capture of new markets by (private) transnational corporations; international institutions, on the other hand, have criticized sovereign governments of corruption and resource mismanagement, of being resistant to best practices, and for their reticence in loosening legal regulations and bureaucratic procedures. As a senior official at the United Nations Office of Legal Affairs has noted, there is "a significant undertow of skepticism among the intended recipients of legal rules [related to Disaster Management]" and further that it is "unusual to find such a level of antipathy so early in the. . .development of legal rules on a topic" (Pronto 2008–2009, p. 454).

## Conclusion

The relationship between law and disaster management, within states and internationally, is formally complex and mediated by a universe of extralegal factors ranging from geography and climate to culture and political economy. At the heart of the controversies surrounding this relationship is the issue of identifying what constitutes a disaster – a question that cannot be answered without engaging equally nebulous (and often politically dangerous) questions related to causation, capabilities, and responsibility. The law produces and curates the conditions under which these questions are asked, and, as such, it plays both constitutive and remedial roles in relation to every stage of disaster management.

# Leader's Role in Employee Performance and Engagement

Theresa Obuobisa-Darko
Methodist University College Ghana, Accra, Ghana

## Synonyms

Engagement; Leadership style; Performance

## Definitions

A **leader** is someone who has followers and is able to influence the followers to get the best out of them. **Leadership** is a process of influencing an individual or group of individuals through empowering them to achieve goals, vision, and mission. **Employee performance** is "the total expected value to organization of the discrete behavioral episodes that an individual carries out over a standard period of time" (Motowidlo 2003, p. 38). Employee **engagement** is a positive fulfilling work-related state of mind which is characterized by vigor, dedication, and absorption (Schaufeli et al. 2002, p. 74).

## Introduction

Research on leadership stands among the most prolific areas within the field of management and human resource management. The success of organizations in general and public sector organizations in particular depends on high level of employees' engagement and willingness to offer their best to improve performance. This willingness depends to a large extent on the behavior of their leaders. Leader behavior (LB) therefore contributes in diverse ways toward organizational as well as individual performance and outcomes. The leadership behavior, employee engagement, and employee task performance nexus is multi-layered; yet, majority of the existing literature on leader behavior have considered the effect of leader behavior on employee performance (Kalsoom et al. 2018; Ohemeng et al. 2018) with minimal evidence available as to the possible mediators in the relationship.

Employee engagement (EE) either makes or breaks organizations and therefore engaged employees are described as an organization's greatest resource due to its association with various individual and organizational outcomes such as turnover, commitment, job satisfaction, and performance. Studies on EE have seen an unprecedented interest in the management as well as human resource management literature in recent years (Popli and Rizvi 2017). Engaged employees are connected emotionally to their work and as a result are hopeful, very active, focus highly on their work, and are willing to put in extra effort to achieve results to guarantee the success of the organization. The leader's behavior which reflects in leadership style has been cited as one of the major antecedents of EE (Popli and Rizvi 2017). Thus, without considering leader behavior when deliberating on employee engagement within an organization can be problematic. However, key leadership style that predicts effective employees' engagement is barely known.

Again, leader behavior has been documented as an antecedent to employee performance. A number of studies have explored the relationship between transformational leaders' behavior and employee task performance (ETP) as well as

transactional leaders' behavior and ETP (Kalsoom et al. 2018). Even though there exists a perception that Ghana suffers from organizational performance problems, existing literature have barely scrutinized the phenomenon of low performance from an employee engagement lens. The literature is scanty on how leader behavior, be it transformational or transactional leader behavior, affects employee performance and engagement within the public sector in developing countries. That is, the mediating role of EE between leaders' behavior and employee task performance has not been exhaustive in the literature. This chapter presents the results of a study on the kind of leader behavior that affects employee engagement most and its mediating role in the relationship between leader behavior and employee task performance within the public sector in developing countries. After first describing the theoretical basis for the chapter, that is the social exchange theory, the chapter continues with a description of employee engagement and other relates constructs. Next is a presentation on leadership behavior – Transformational and Transactional leadership styles – and how it is related with EE. This is followed by details of the relationship between EE and performance. Following this is a description of the relationship between the three main constructs for the chapter: leadership, employee engagement, and employee performance. The chapter closes with a conclusion and lessons for the public sector leader as well as suggestions for further studies in order to enhance the understanding of the relationship between different leadership styles, EE, and employee performance.

## The Social Exchange Theory

The Social Exchange Theory (SET), a theory used to explain relationship, is based on the works of Homans (1958, 1961, 1974) and Blau (1960; Bakker and Albrecht 2018). The theory postulates that social behavior is the outcome of an exchange process and the motivation of this exchange is to get the most out of the relationship and minimize costs. In any social exchange, individuals weigh the likely benefits and risks of the relationship. Where the risks are higher than the benefits, the individuals will turn their backs to such relationship and vice versa. The theory provides a framework for explaining employees' motivation, commitment, and work behavior in general and how leader behavior influence employees' performance when they are engaged. What an individual gives in the exchange process, which may be material or non-material good, is described as a cost while what is derived out of the relationship is a reward.

Bakker and Albrecht (2018) defined a major exponent of social exchange as "voluntary actions of individuals that are motivated by the returns they are expected to bring and typically do in fact bring from others" (p. 91). Gouldner (1960) had earlier explained social exchange as involving a "mutually contingent exchange of benefits between two or more units" (p. 164). That is, this dyadic exchange relationship should be useful to both parties for it to continue.

Four characteristics of the social exchange theory according to Cropanzano et al. (2017) are that social life involves a series of sequential transactions between two or more individuals, the exchanges involve an exchange of resources through a process of reciprocity, the quality of these exchanges is sometimes influenced by the kind of relationship between them, and lastly, the social exchanges tend to involve greater trust and flexibility.

The first characteristic suggested by Cropanzano et al. (2017) is that the social life one indulges in encompasses some sequential dealings and exchanges between two or more persons. These exchanges, usually not one act but involve several in a sequential manner, may result in positive or negative attitude or behavior which affect employees' performance. Therefore, when public sector leaders relate well with their followers, they will in turn respond by being engaged, and work with vigor to achieve targets set.

Another characteristic is that the exchanges involve an exchange of resources through a process of reciprocity. Reciprocity, derived from the Latin word "reciprocare" meaning moving back

and forth, describes a mutual exchange and not necessarily an equivalent or an equal give-and-take. Reciprocity, the basis of social relations, describes a kind of interaction that basically is pivoted on mutuality. It is regarded as "the pattern of exchange through which the mutual dependence of people, brought about by the division of labor, is realized" (Gouldner 1960, pp. 170–171). When there exists mutual dependence between individuals who relate and they project some kind of positive benefits in the relationship, it persuades them to feel obliged to reciprocate. Hence, it is important for individuals to determine whether an action experienced is beneficial or otherwise. This is determined based on the outcome or consequences of the action as well as the motivation or the intentions of the actions. That is, the kindness of an action is not determined by only the consequences but also by the intention. Thirdly, the quality of these exchanges is sometimes influenced by the kind of relationship between them. This explains why the quality of relationship between a leader and his followers is a vital antecedent for employee engagement. Therefore, employees who have good quality relationship with their leaders feel obliged to reciprocate by using their discretion at work, be dedicated and work with vigor. Thus, when public sector leaders in their dealings with their followers make them perceive they are benefiting from that relationship, they will reciprocate in a positive manner by being engaged.

Lastly, the social exchanges tend to involve greater trust and flexibility. Trust is an anticipation that another individual you are dealing with will act in your interest. "To say 'A trusts B' means that 'A' expects that 'B' will not exploit a vulnerability A has created for himself by taking the action. It describes a person's willingness to be vulnerable to other persons" actions with the confidence that that person will act as expected. One out of the two conditions suggested by Rousseau et al. (1998) that is required for trust to exist is interdependence. Interdependence reflects a balance of self and others within a relationship where one relies on another with the aim of meeting each other's needs. This reliance can be possible if each trusts the other, knowing that the other's actions or inactions will be to his benefit and not otherwise. Trust is therefore the bridge for effective relationship and interdependence. Trust, therefore, is required for effective interdependence.

The second condition is that there is risk and uncertainty related to the action to be taken or the situation. When there exists a level of uncertainty, trust becomes very essential. This is because, when one trust another, even though there may be a certain level of risk and uncertainty, the individual will feel safe because he knows that the other person he is dealing with will not exploit his vulnerability but will act in his favor.

Drawing from the SET's perspective, followers of a leader are likely to reciprocate the leader's support by exhibiting the characteristics of an engaged employee which will affect their performance positively. Thus, a positive or negative exchange relationship between a person, in this case, the leader and the employee, will affect the employee' attitude and feeling, that is the level of engagement and its ripple effect on their performance.

## Employee Engagement Explained

There has been an upsurge in the interest in employee engagement issues and the quest to its understanding. Employee engagement (EE) emerged in the organizational and business management literature about three decades ago. Despite this, there is no consensus on what it means, as well as its characteristics. Kahn (1990) was first to introduce the concept "employee engagement" to show how people are personally engaged or disengaged at work. He suggested that engagement is the personal expression of self-in-role. He described it as the "harnessing of organizational members' selves to their work roles: in engagement people employ and express themselves physically, cognitively and emotionally during role performances" (p. 694). Several researchers from Kahn (1990), Schaufeli et al. (2002), Saks (2006), Shuck and Wollard (2010), to Albrecht et al. (2018) have contributed immensely towards the theoretical understanding of EE. Following Kahn's explanation, Schaufeli,

Salanova, González-Romá, and Bakker (2002, p. 74) conceptualized engagement as "a positive fulfilling work-related state of mind which is characterized by vigor, dedication and absorption." To them, vigor refers to the exhibition of high levels of energy, mental resilience, willingness to invest efforts in one's work, and persistence in difficulties, while dedication is seen through the show of enthusiasm, inspiration, pride, and challenge at work, and absorption referring to the exhibition of high concentration, focus, attachment to one's work, and deep engrossment in work. It is an intellectual and emotional attachment that employees have to their jobs and organizations, which influences them to apply additional discretionary effort when working. Similarly, Saks (2006, p. 602) defined employee engagement as "a distinct and unique construct consisting of cognitive, emotional and behavioral components that are associated with individual role performance." This implies that to be engaged is not just being cognitively attentive to the job or feeling and expressing positive emotions or doing work for doing sake, but rather it mirrors investment of one's cognitive, emotional, and physical energies concurrently in performing one's roles. This reflects in the definition of EE by Shuck and Wollard (2010, p. 103) that it is "an individual employee's cognitive, emotional and behavioral state directed towards desired organizational outcomes." Interestingly, Leiter and Maslach (2005) had earlier described it as the opposite end of a continuum between engagement and burnout. They contend that the three dimensions of burnout, exhaustion, cynicism, and ineffectiveness, are the direct opposite of the dimensions of engagement being vigor (exhaustion), involvement (cynicism), and efficacy (ineffectiveness). EE therefore is both an attitude and a behavior. It concerns a self-investment where one invests more than just a single aspect of self, but rather several dimensions – physical, emotional, and cognitive. This investment in these areas tends to reflect in the individual's attitudes and behaviors at all times. Employee engagement can thus be explained as a positive state of mind that results in employees' willingness to put in all their efforts, be it cognitive, emotional, or physical, to facilitate the successful achievement of both individual and organizational goals. An engaged employee will therefore be one who is physically, cognitively, and emotionally attached to the organization.

### Employee Engagement and Other Concepts

It is worth noting that employee engagement (EE) is a distinct construct even though there exist some similarities between EE and other well-known employee outcomes such as commitment, job satisfaction, and organization citizenship behavior (OCB). The resemblance may be because employee engagement does not establish new content but rather offers a blend of older familiar concept like these and also because each of these constructs reflects a positive work-related mental or emotional state. Thus, there exists a clear distinction between these concepts and employee engagement as they refer to one dimension of the self (cognitive or affective). On the contrary, employee engagement, an all-inclusive concept, refers to different dimensions of the self – physical, emotional, cognitive – in performing the work assigned. As per Kahn's (1992) conceptualization, engagement is not simply working hard but putting the real "self" at work.

Job satisfaction and employee engagement are not the same. Job satisfaction is a positive feeling about one's job resulting from an evaluation of its characteristics (Robbins and Judge 2009). Engagement however is seen as going beyond job satisfaction and describes an employee's personal state of involvement, affection, contribution, and ownership. This shows that satisfaction is about the affective aspect of engagement.

Another concept similar to employee engagement is employee commitment which is also a facet of engagement but not sufficient for engagement. Employee commitment refers to the level of employee satisfaction as well as identification with an organization, while employee engagement focuses on not just identification with an organization but an emotional attachment to the organization where the employee is always trying to give his/her maximum contribution and go extra mile for organization success.

Organizational Citizenship Behavior (OCB) also differs from employee engagement. OCB is discretionary behavior that is not part of an employee's formal job requirements but nevertheless promotes the effective functioning of the organization (Robbins and Judge 2009). This indicates that whereas OCB is about behaviors or results of behaviors, engagement is about how one feels about or experiences the job as well as the individual's intent to invest himself/herself emotionally, physically, and cognitively in the job (Kahn 1990; Schaufeli et al. 2002; Saks 2006). Therefore, employee engagement is not a behavior, but it is a state of mind that leads to a certain behavior.

Job involvement, another term similar to employee engagement, describes the measure of the degree to which employee is involved in his job and takes part in decision making (Khan et al. 2011). It is therefore a part of EE which is more than a cognitive effort but an all-encompassing concept where the employee chooses to invest his emotional, physical, and cognitive energies.

Hence job satisfaction, organizational commitment, job involvement, and OCB may have some characteristics of engagement but are definitely not synonymous. None of them reflect the two-way nature as it is in the case of engagement. It can therefore be concluded that even though the meaning of engagement sometimes overlaps with other concepts and ideas, it is still a discrete and unique concept, which entails behavioral, cognitive, and emotional elements.

## Leader Behavior and Employee Engagement

Leadership is about influence, and over the years the need to have competent leaders in organizations in general and the public sector in particular and to ensure employees perform well has been of great importance. This is because leaders, be it transformational or transactional, typically interact with their followers daily and are able to influence them to willingly sacrifice for better course even though the extent of influence varies.

The transformational leader with his unique four-dimensional characteristics is described as one of the best leadership styles. These four dimensions: idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Robbins and Judge 2009) enable such leaders to influence their followers to put in their best because they have a sense of what they are up to and have the capabilities to encourage, inspire, and motivate them to accept new goals and new ways of doing things. Such leaders boost public service motivation and this results in shaping positive organizational outcomes (Wright et al. 2012) like engagement.

Idealized influence reflects the leader's ability to establish pride and confidence in followers, offer a vision and a sense of mission, command reverence and trust, and lay down high standards to emulate (Antonakis et al. 2003; Robbins and Judge 2009). With these characteristics leaders who have high levels of idealized influence are willing to take risks, consistent, trustworthy, and as a result, their followers demonstrate high standards of conduct and are willing to be dedicated, work with vigor, and offer their best.

Intellectual stimulation refers to leaders' behaviors that appeal to followers' sense of logic and analysis by encouraging them to think inventively and discover solutions to complicated problems (Antonakis et al. 2003; Robbins and Judge 2009). This characteristic of the leaders causes them to encourage their followers to take active part in decision making and help promote logical reasoning, rationality, and careful problem-solving. The leaders, thus, support followers as they try new approaches and develop new ideas and things. This indirectly shapes followers' values and perception and builds their level of confidence and ownership of decisions taken. This confidence makes employees perceive they are competent and capable to do the work, and so go the extra mile to ensure goals of decisions taken are achieved.

Individualized consideration characteristic reflects in the leader's actions that offer personalized support and encouragement, provide individual attention, coach, and advice followers which help them to develop and self-actualize. Leaders

with high levels of individualized consideration tend to show much concern for their followers, hence they know much about them which enable them address each employee's needs and desires in unique ways. The social exchange theory posits that if followers of a leader perceive their leader to care for their well-being and provide personal attention, they feel attached to the leader and thus feel indebted to "return the favor" offered by their supervisor.

Inspirational motivation, the last characteristic of a transformational leader, refers to the behavior of the leader that energizes their followers. Such leaders present an optimistic and attainable view of the future; mold expectations and shapes meaning; and create a sense of priorities and purpose (Kirkbride 2006). Thus, the transformational leaders stimulate their followers to view the future with optimism, stressing ambitious goals, projecting a perfect vision, communicating to them that the vision formulated is achievable, and as a result influence these followers not just to follow them personally but to believe in the vision of the organization. Bearing in mind the antecedents of employee performance like availability of resources, trust, effective communication, and the unique characteristics of the transformational leader, it is inferred and concluded that a transformational leader has positive effect on employee task performance and also such a leader's behavior predicts and have a significant positive effect on employee engagement.

Transactional leadership is centered on leader-subordinate interchange where subordinates perform according to the will of the leader and the leader positively rewards the effort. Thus, such leaders use reward and punishment to gain compliance from their subordinates. Transactional leaders have three dimensions: contingency reward, management-by-exception (active), and management-by-exception (passive) (Antonakis et al. 2003).

The contingency reward characteristic of the leader results in the leader and followers coming into an agreement on what the follower should do to be rewarded or avoid punishment. Thus, followers of the transactional leader receive incentives and rewards based on the accomplishment of agreed contract. Management-by-exception (active) reflects in the transactional leader behavior where leaders anticipate mistakes and enforce rules, which may prevent such mistakes from occurrence (Breevaart et al. 2014). Thus, the leader focuses on the exceptions, controls the work assigned, and notifies the employees as the problems ensue. The main indicators are that such leaders bring to the attention only substantial deviations; attend to these mistakes and deviations; remain alert for infractions of the rules; and guide followers to correct mistakes. The public sector is managed by rules and regulations, and so when leaders exhibit such characteristics, it ensures the appropriate management of the sector.

Management-by-exception (Passive) in contrast refers to the leader confronting employees with their mistakes and putting across dissatisfaction about the mistake that has been made (Breevaart et al. 2014). In effect such leaders intervene only if the standards agreed upon are not met, exceptional circumstances become obvious, and try to avoid making changes by emphasizing the importance of routine task and performing task assigned based on agreed contract. Consequently, followers of transactional leaders do not perform beyond expectation (Robbins and Judge 2009). Therefore, leaders who exhibit more of transactional leader characteristic will affect the level of employees' task performance and engagement positively, though not as much as one who exhibits more of the transformational leader characteristics.

## Engaged Employee and Employee Performance

Understanding the nexus between EE and employee performance is considered to be essential. Like most behavioral related concepts, there is no consensus on the definition of performance, and as a result, there exist a plethora of definitions and scholars are yet to reach a compromise as to what it means. While some explain performance as an outcome of activity, others see it as behavior; and others too describe it as both behavior and outcomes. According to Armstrong

(2006, p. 498), performance is the "accomplishment, execution, carrying out, working out of anything ordered or undertaken." It is the activity by employees that transforms raw materials of an organization into the goods and services. Awadh and Ismail (2012) describe performance to involve the conversion of efforts of employees into productivities in order to achieve organizational goals. Thus, performance from the perspective of these authors is an outcome (result) and not the input (behavior).

Performance, a property of behavior is reflected in the definition of Motowidlo (2003) as "the total expected value to organization of the discrete behavioral episodes that an individual carries out over a standard period of time" (Motowidlo 2003, p. 38). It reflects a person's behavior where the individual does above regular task expectations and willingly gets involved in voluntary activities that help advance organizational goals. Performance is thus seen in terms of behaviors or actions of employees and not results of the actions.

Contrary to Motowidlo's (2003) definition of performance as a behavior, Viswesvaran and Ones (2000) define performance as "scalable actions, behaviors and outcomes that employees engage in or bring about that are linked with and contribute to organizational goals" (p. 216). This definition of performance points out that performance could be described as both a behavior and an outcome. Some behaviors that can therefore describe employees' task performance include work quality, job skills, job abilities, and job knowledge. Employee performance can therefore be explained as the execution of roles assigned with proficiency (job specific, technical, acceptable behavior) that contributes to the organization's success.

The above discussion points to the fact that to enhance employee performance, one of the best strategies to adopt is to ensure employees are engaged. This is because engagement has implications for performance. Engaged employees are persistent in difficulties, and focus and make all efforts to help the organization achieve its goals. They make use of high levels of their energies, concentrate on assigned work, and are able to cope with adversity. They find their work more enjoyable and this results in better actions. Engaged employees are known to work with vigor and more dedication and get absorbed in the work they do. This explains why engaged employees have far-reaching consequences on performance. The energy or vigor inherent in engaged employees cause them to bring their full potentials to the job they perform. Additionally, their ability to get absorbed and therefore concentrate on their jobs results in better outcomes.

The nature of work makes it difficult to provide details of what is expected of employees. Thus, with the dedication characteristic of the engaged employee, it causes them to take initiative and be proactive to their work. Consequently, they are able to anticipate and come up with new and innovative ideas resulting in better performance. Thus, when employees are engaged, they are ready to go the extra mile and exhibit the acceptable behavior and attitudes which lead to better accomplishment of goals at the workplace. Therefore, the level at which employees are engaged has a significant and positive influence on the performance of their task.

## Leader Behavior, Employee Engagement, and Employee Performance Nexus in Practice

Besides leadership, one variable which is receiving significant attention and seems to drive positive employee behavior and likely to impact performance is employee engagement (Popli and Rizvi 2017). Leaders interact with their followers as they discharge their responsibilities. When the quality of exchange relationship improves, the level of engagement also goes up, resulting in an increase in performance. This reflects the mediating role of employee engagement between leader behavior (Transformational and Transactional) and employee task performance.

This mediating role of engagement can be explained from the SET's perspective. This theory asserts that all social behaviors involve a reciprocal relationship which is guided by certain rules of exchange. When leaders relate well with their

subordinates, they feel obligated to put in extra, as a way of repaying for the leader's behavior. Conversely, if followers perceive their leaders as not forthcoming, not concerned about their well-being, and not relating well with them, they become adamant and not ready to put in extra effort, where necessary, and this negatively affects employee's performance.

Both transformational and transactional leaders affect the level of employee engagement. However, between these two leadership styles the transformational leader has a better effect on their followers' engagement levels than those who exhibited transactional leader characteristics. Thus, as transformational leaders within the public sector serve as role models and point followers toward goals set and encourage them to challenge the status quo (Wright et al. 2012), it increases their level of engagement, leading to their readiness to offer better services in exchange for the leader's behavior, as posited by the SET with a resultant effect of increased performance.

Generally, the leader behavior that affects employee engagement and performance most, as indicated earlier, is the transformational leadership style. People within a particularistic context, like Ghana, are interested in relationship and not focus much on rules and procedures. The characteristics of transformational leaders, being idealized, influence intellectual stimulation, inspirational motivation, and individualized consideration help in the creation of better relationship with subordinates which more often than not move them to be willing to put in extra and therefore better performance.

Both national and organizational cultures have a lot of impact on employee behavior. The resultant effect of the Ghanaian culture where there exists high uncertainty avoidance (Ansah and Chinomona 2017) leads to the need to share information and build trust among individuals. The intellectual stimulation characteristic of the transformational leader results in the delivery of timely information which helps in building trust between him/herself and his/her followers. When the leader builds trust and ensures followers have adequate information, they feel secure, willing to put in their all, and this impacts positively on their performance.

Again, the possession of achievement and support culture significantly cause EE in the public sector in Ghana (Brenyah and Obuobisa-Darko 2017). Leaders therefore have to ensure that such culture prevails so that employees will be engaged and perform. In an achievement culture, rules and procedures are limited, employees are encouraged to be innovative, it produces a strong sense of purpose in employees, and their expertise are highly valued. When employees perceive their skills, expertise and work are appreciated, and they feel engaged and offer their best. Leaders in the organization can create achievement culture by developing and setting achievement targets with their followers. Employees who develop targets with their leaders are more satisfied when they reach the targets. They are ready to include more challenging targets the next time they have the opportunity to set targets. Such behavior by the transformational leader emanating from his intellectual stimulation characteristic results in his followers who are employees being engaged and this impacts positively on the employees' performance.

Another strategy a leader can use to create an achievement culture is to monitor and provide rewards for accomplishments of goals from time to time. When followers realize their supervisors are interested in their work and so are keeping an eye on them and giving them feedback, they are encouraged to put in their best to achieve the goals of the assignment. Again, when followers are rewarded for accomplishment of an activity it motivates them to put in more effort in subsequent activities since as the saying goes "success breeds success."

Again, since the prevalence of support culture causes employees to be engaged, it behooves on public sector leaders to ensure employees contribute out of a sense of commitment in the organization. In organizations where support culture exists, there is good communication, employees cooperate, employees are able to resolve conflicts, and followers tend to trust one another and are ready to offer assistance to their colleagues. Therefore, leaders in the public sector can create support culture by forming career mentoring committees where employees can seek support and guidance in pursuing their careers. The support

culture will encourage people to be available to offer assistance and support where necessary and by rewarding such people will result in creation of effective and open communication channels.

From the viewpoint of the SET the employees' positive perception of leaders' personal interest in their welfare, a characteristic of transformational leader gives rise to a willingness to be ready to invest all their efforts, which consequently lead to high levels of task performance. Consequently, engaged employees may feel indebted to their leaders, thus the organization, and hence exert more effort in the performance of their task, leading to a higher level of task performance.

Perceived leader or supervisor support is one of the major antecedents of employee engagement. It is the degree to which subordinates have a mind-set that their supervisors care about their well-being, value their contribution, and are supportive. This explains why when employees, as a result of the kind of relationship they have with their supervisor, perceive their supervisor to be genuinely concerned about well-being, they tend to be engaged. The individualized consideration characteristic of a transformational leader causes him/her to relate well with his subordinates and become attuned to their unique needs and interest, so he could address them and the resultant effect is engagement which affect performance positively, indicating the mediating role engagement plays between leadership style and employee performance.

Both transformational and transactional leader behavior affect employee engagement. However, transformational leader affects it better than transactional leaders. Within the Ghanaian culture, there exists high power distance which has a negative impact on employee engagement (Brenyah and Obuobisa-Darko 2017). Power distance renders huge communication gap between leaders and their subordinates. Thus, as the transactional leader is characterized by control and not relationship, it makes employees find it difficult to air their views which result in low employee engagement, unlike the transformational leader who will inspire followers to express their views and ideas and show interest in their individual needs, resulting in increase in engagement. In addition, the existence of high-power distance result in minimal personal relationship between the transactional leader and his/her followers. As a result, followers of such leaders mostly will not be engaged, explaining why EE does not mediate the relationship between transactional leader behavior and EE.

## Conclusion

Improving employee performance and engagement is of significant importance in every organization, be it private or public. While there are several antecedents to EE and ETP, leader behavior is known to be one of the major ones. Leader behavior is classified severally with transformational and transactional leader behavior being one of them. The transformational leader is characterized as one who establishes pride and confidence in followers, commands trust, willing to take risks, and are consistent. Such leaders encourage employees to think and discover solutions to problems, provide personal attention and treat each employee individually, and present an optimistic and attainable view of the future. The transactional leader comes into an agreement on what the follower should do to be rewarded or to avoid punishment, anticipate mistakes, and enforce rules, which may prevent them from happening, puts across dissatisfaction about mistake, and remains alert for infractions of the rule.

Where the leader exhibits certain characteristics, it leads to good quality relationship between him/herself and his/her followers and this makes them feel obliged to reciprocate this gesture by working with vigor and be dedicated which positively impacts their performance. Thus, the behavior of the leader affects employee engagement and by extension task performance. When a leader exhibits these unique characteristics of the transformational leader, he is able to affect positively the level of employees' engagement and their performance more than the leader who exhibits the transactional leader's characteristics. EE mediates the relationship between transformational leader behavior and employee task performance but does not mediate the relationship

between transactional leader behavior and employee task performance.

Even though context matters in certain cases, the impact of the transformational leader behavior on employee engagement and their performance is similar in both developing and developed countries. From the SET perspective, leaders who ensure good quality relationship between themselves and their followers are able to increase their followers' level of engagement and the resultant effect is improved performance. Due to the important role and special service offered by PSO employees, it is critical that leaders in such organizations develop high-quality relationship between themselves and their followers by exhibiting more of the transformational leader characteristics to increase employee engagement and their performance. Given the scope, design and method, it is suggested that future research could focus on other sectors from other theoretical lenses and a comparative study between public and private sector organization could be carried out.

## Lessons for Public Sector Organization Leaders

It is widely recognized that the performance of public sector organization is increasingly becoming a critical issue in today's ever-changing and dynamic environment. Within the public sector, it is important for leaders to understand the leader behavior, employee engagement, and performance nexus owing to the reason for its existence. While the purpose of public sector is to provide services to the citizenry, the private sector organizations focus on maximizing financial gains. Due to the significant role the public sector employees play toward national development, it needs employees who are vigorous, energetic, work with dedication, and get absorbed in their work. That is, for the public sector organizations to succeed, it needs engaged employees. Since the existence of power culture negatively impacts one within the public sector (Brenyah and Obuobisa-Darko 2017), leaders within the public sector organization should ensure followers actively participate in all activities and decision making rather than the leaders being autocratic. When followers are part of the decision-making process, it makes them feel that they have a stake in the accomplishment of the organization's goals and therefore will vigorously work toward it. Again, involving them in the decision-making process offers employees opportunity to express their opinion which can facilitate team building and improve relationship.

Again, since the quality of the relationship affects employee engagement, leaders in the public sector should exhibit the appropriate leader characteristics, like transformational leader characteristics which will cause their followers to become engaged and influence their performance positively. It therefore behooves on public sector organizations leaders to exhibit establish pride and confidence in their followers, encourage and support them to think inventively and take active part in decision making, show concern for each follower, and present an optimistic view of the future to ensure employees get engaged to give off their best.

# Leaders and Innovations in Public Organizations

Siegrun Fox Freyss
Department of Political Science, California State University, Los Angeles, Los Angeles, CA, USA

L

## Synonyms

Leader: Catalyst; Change agent; Executive; Manager; Pioneer; Problem solver; Strategist; Transformer; Visionary

Innovations: Change; Reengineering; Reinvention

Public Organizations: Governance; Government agencies; Public administration; Public bureaucracy; Public management

Management innovations offer numerous tools to help governments cope with the complexities of our times. The innovations can be used to direct changes and successfully transition from the modern, industrial age to the postmodern, high-tech age, also called the postindustrial or information age. Increased population diversity and population mobility add to the epochal dynamics. A well-functioning government can provide the necessary infrastructure for the new economy to flourish and for its people to achieve their potential. The successful transition requires leadership to

ensure that trends move in a desirable direction, protecting and promoting the fundamental democratic values and institutions of the nation (Freyss 2004, 2016; County of Los Angeles 2015).

The literature distinguishes between leaders and managers – leaders pursue a vision and are focused on the mission, while managers are supposed to implement the vision and mission. This chapter applies the two terms interchangeably.

## In the Industrial Age: Who Are the Leaders of Organizational Innovations?

Over the last century, the management literature, including the public administration literature, has identified various leadership styles that managers can adopt depending on what approach is most appropriate for particular organizational circumstances. Table 1 shows a few of the early arguments. Frederick Taylor suggested managers become researchers and observers, constantly seeking improvements in operations and training their workers accordingly. Taylor wrote at the height of the industrial age, when the constant search for improved efficiencies in factory work and bureaucratic performance became a best practice. However, Taylor was criticized for his dehumanization of workers, turning them into cogs in the service of machines. He did not consider that workers might be thinking about their jobs and could be used as sources for innovative ideas (Taylor 1912).

Need psychologists provided a cogent critique of Taylor and proposed alternative leadership styles. Douglas McGregor, for instance, argued that workers would be more efficient when their personal needs and organizational needs coincided. He expressed the contrast between ineffective and effective management approaches with the concept of Theory X and Theory Y. See Table 2. According to Theory X, the average worker is lazy, and it is the manager's responsibility to overcome the workers' resistance to get work done. In contrast, under Theory Y, workers are willing to work as long as the job is meaningful and interesting. A Theory Y culture is conducive to the emergence of organizational innovations, with management encouraging employees to suggest new ideas that strengthen the pursuit of the agency's mission (McGregor 1957).

In the 1960, Paul Lawrence and Jay Lorsch (1969, pp. 156–158) introduced contingency theory, which provides a good conceptual foundation for times of complex changes. They argued that there was not one best way to manage but that the proper strategy was contingent on certain factors, especially the nature of the assigned work and the

**Leaders and Innovations in Public Organizations, Table 1** Leadership styles for the industrial age and beyond

| Goal | Name | Role of manager |
|---|---|---|
| More efficient industrial and bureaucratic production | Frederick Taylor | Acting as researcher, observer, overseer, enforcer of work rules, trainer |
| More efficient production by focusing on the human side of industrial and bureaucratic production | Douglas McGregor | Applying Theory Y rather than Theory X, arranging operations in such a way that the workers' individual needs coincide with organizational objectives |
| Adapting leadership styles to the nature of the work and competencies of employees | Paul Lawrence and Jay Lorsch | Finding appropriate managerial styles (see Table 3 for more) |

**Leaders and Innovations in Public Organizations, Table 2** McGregor's argument – leadership styles for or against innovative management

| | Theory X | Theory Y |
|---|---|---|
| **View of human nature** | People by nature lazy | People by nature willing to work as long as the work is meaningful and interesting |
| **Work motivators** | Coercion, fear, threats, and money to pay for basic needs | Work that enables employees to develop their potential |

**Leaders and Innovations in Public Organizations, Table 3** Leadership styles for transitional times

| Tasks to be accomplished | Employees inexperienced or untrained ← | → Employees experienced and had professional training |
|---|---|---|
| Routine ↑ ↓ Constantly changing or complex | management needs to provide training ← | → little supervision required |
| | close supervision required ← | → some supervision required |

Adapted from Freyss (2014, p. 1)

qualifications of the employees. Table 3 summarizes the argument. The routine versus complex tasks, shown in the table, can be seen as the endpoints of a continuum, likewise the distinction between inexperienced and experienced employees.

## In the High-Tech Age: Who Are the Leaders of Organizational Innovations?

At the height of the high-tech revolution, the US Office of Personnel Management (OPM) developed detailed guidelines to make leadership qualifications for the high-tech age transparent (2012a, b). For senior executive positions, OPM identified 28 competencies, grouped together under six categories. See Table 4. Categories VII and VIII were added to highlight the public and democratic mission that government executives are expected to uphold and promote. Actually, in light of flattened hierarchies and increased responsibilities for supervisors and mid-management, one can argue that the 33 qualifications be promoted in the middle ranks as well.

In the corporate sector, charismatic leadership and transformational leadership are important qualifications for senior executive positions. The qualifications are future oriented and accept change in the pursuit of a vision (Greenberg and Baron 2007, pp. 459–463). OPM identifies similar qualities for the senior executive service under the leading change category, but overall most competencies fall under transactional leadership, which means being competent in getting results. The difference may be due to the fact that in the public sector, elected officials are expected to lead using charisma and visionary thinking to get elected and reelected.

The discussion now turns from leadership styles and leadership competencies to organizational innovations.

## What Are Organizational Innovations in Public Administration?

With the book *Reinventing Government*, David Osborne and Ted Gaebler (1992) popularized management innovations introduced in the 1980s across the United States by enterprising public administrators. The book was written at the onset of the high-tech revolution, but it did already capture the emerging idea of an information age, where the most important jobs would be occupied by knowledge producers and knowledge workers. The arguments can prepare professionals to envision government services, what to provide and how to provide it, in new ways. Governments should:

1. See themselves as catalysts, leading by steering rather than rowing.
2. Become community owned and empower communities, rather than serving.

**Leaders and Innovations in Public Organizations, Table 4** Leadership competencies for the high-tech age

| VIII. Leadership for the common good | 31. Valuing, upholding, and promoting democratic institutions | 32. High ethical standards<br>33. Using high-tech tools for the common good |

Sources: US Office of Personnel Administration (2012a, b); Crosby and Bryson (2005) (Categories VII and VIII added by author)

3. Be customer driven, which means meeting the needs of the customer, not the bureaucracy.
4. Decentralize operations, replacing hierarchy with participatory management and teamwork.
5. Inject competition into service delivery, be market oriented, and leverage change through the market.
6. Transform themselves from rule-driven to mission-driven organizations.
7. Be results oriented and fund outcomes, not inputs.
8. Anticipate possible problems and seek prevention rather than a cure.

The *Reinventing Government* arguments have been criticized by some who see the propositions as simplistic and contradictory slogans. However, the many examples in the *Reinventor's Fieldbook* strengthen the applicability of the reinventing ideas for governments seeking transformative pathways (Osborne and Plastrik 2000). Recent reviews of the book also acknowledge the ongoing relevancy of the strategies highlighted in the book (Gaebler et al. 2015).

The next question is: What kind of leadership competencies are required to generate organizational innovations and make effective use of them? Table 5 pairs leadership qualities with progressive government practices, gleaned from the *Reinventing Government* book and other sources.

## Leadership Competencies for Organizational Innovations

The complex changes, due to the high-tech revolution and increased population diversity, can be manageable when government leaders have the choice of steering, rather than rowing. The corresponding leadership competencies can be subsumed under the leading change category, which includes qualities like creativity, flexibility, resilience, being a visionary, and embracing strategic thinking. Following the insights of former Secretary of Defense Robert Gates (2016), one can add a passion for leadership in the face of substantial changes around the world.

The empowerment of community groups is a way to share the burden of policymaking, as well as the burden of implementation. The burden sharing is possible because community leaders tend to be better educated, and they want to be heard and engaged. Also the Internet has greatly expanded communication channels. However, to

|---|---|
| I. Leading change | Government as catalyst<br>Leading by steering rather than rowing<br>A passion for leadership |
| II. Leading people | Be community owned<br>Empowered communities<br>Empowered employees |
| III. Results driven | Injecting competition into service delivery<br>Be market oriented<br>Leveraging change through the market |
| IV. Business acumen | Be results oriented and fund outcomes, not inputs<br>Be customer driven, meeting the needs of the customer, not the bureaucracy |
| V. Building coalitions | Decentralize operations<br>Replace hierarchy with participatory management and teamwork<br>Being a hub leader in intergovernmental networks |
| VI. Fundamental competencies | Excellent communication skills across multiple channels, including social media<br>Making the jurisdiction's web presence highly inviting and informative<br>High ethical standards documented by videos of smartphones and other high-tech tools |
| VII. Mission driven | From rule-driven to mission-driven management<br>Anticipate possible problems and seek prevention rather than a cure |
| VIII. Leadership for the common good | Valuing and promoting democratic institutions<br>Also judicious empowerment of employees and citizens |

Sources: US Office of Personnel Management (2012a, b); Crosby and Bryson (2005) (Categories VII and VIII added by author); Osborne and Gaebler (1992); Gates (2016)

lead external groups successfully, government officials need to have excellent communication skills. They also need to be trained in conflict management, be inclusive in terms of diversity, willing to develop others, and effective in team building (McCorkle and Witt 2014).

The empowerment movement also includes mid- and lower-level employees (Berman et al. 2016). However, there are some differences. In contrast to community groups, public employees can be involved in managerial decision making on a more regular basis, and team work or work teams can become part of the organizational structure. This is also called decentralizing operations and replacing strict hierarchies with a participatory management style. It is supposed to be conducive for new ideas to bubble up. The question whether performance evaluations can improve team work or destroy it has not been conclusively answered. It apparently depends on several factors, in particular the organizational culture, its values, norms, integrity, reliability, consistency, and accountability (Ott 1989; Liff 2007).

Being result driven is another important quality of successful leaders. They may act like entrepreneurs, favor competition in service delivery, be market oriented, and leverage change through the market. Decades of experiments with various privatization approaches have shown which approach is the optimal one, that is, given the nature of the service and clientele, as well as the strengths and constraints of entities operating in the public sector, the for-profit sector, or the non-profit sector (Kee and Newcomer 2008).

Results-driven leaders may not have the patience required when community groups or lower-level employees are part of the decision-making process. On the other hand, results-driven professionals may be able to keep the groups focused on the goals and objectives of the agency's programs. To achieve credibility, results-driven leaders need to be problem solvers and have technical credibility, a trait which is related to the next point.

Strong business acumen helps to get results. It means funding outcomes, not inputs, being customer driven, and meeting the needs of customers, not the bureaucracy. For starters, a well-designed website can focus on residents' information needs while making the online visit a pleasant experience. A solid management foundation in finance, human capital, and software technology is

desirable. However, a leader who is a visionary and likes to pursue organizational innovations may not be a good day-to-day manager. Therefore, these roles may be carried out by different individuals.

Building coalitions internally within the organization and externally with community groups can help administrators achieve complex departmental objectives. The strategy is related to the empowering of employees and citizens. It may mean coping with administrative complexity by decentralization of operations and replacing hierarchical organization charts with participatory management, teamwork, and partnerships. To be successful in such a context, the administrator requires political acumen and be willing to negotiate, to bargain, and to compromise.

All these capabilities can be applied effectively when they are supported by fundamental competencies. Interpersonal skills, as well as oral and written communication skills, can bring people together in team work and hold them together for the long term. In the process, that enable it to make employees can observe that their superiors have high moral standards and treat their subordinates fairly. Transparency generates a positive organizational culture and can be used to motivate employees.

Overall, the work of public administrators is supposed to be mission driven and not held back by unnecessary rules. A mission-driven culture anticipates possible problems and seeks prevention rather than a cure. A SWOT analysis can help identify internal strengths and weaknesses, as well as external opportunities and threats. Table 6 summarizes the dynamic relationships between the internal and external conditions (Tompkins et al. 2009, p. 3).

Leading for the common good means valuing and promoting democratic institutions. It means using communication channels with the public that are preferred by different generations. Retired people may want to attend meetings in city hall in person, while younger people live by social media. Leading for the common good also means upholding high ethical standards. This last point is especially relevant in the present, transitional period. The information age and high-tech economy have generated many unexpected changes, and their professional, ethical applications require firm leadership (Crosby and Bryson 2005).

The following paragraphs discuss some of the implications of Table 5, which relates executive leadership competencies to organizational innovations. The empowerment of employees and communities can bring about change in the traditional organization chart. The steep pyramid is replaced by a flattened hierarchy or by a circular setup where senior management occupies center offices with mid-level and rank-and-file employees arranged in various ways around the inner circle. Trammell Crow, the highly successful real estate developer, had his office space in Dallas organized in a circular pattern (Nocera 1984, p. 205).

The model of an inverted pyramid is another innovative idea. Proponents of the model argue that the frontline employees, who actually interact with the public, should be at the top. Managers are supposed to ensure that the frontline employees have the resources to do an effective job. Resources can mean better training, more time for each case, or more technical support.

The increased value put on frontline employees has led to a recalibration of work performance. Traditionally, dealing with poor performance has

**Leaders and Innovations in Public Organizations, Table 6** SWOT analysis

| | Internal | |
|---|---|---|
| External | Strengths | Weaknesses |
| **Opportunities** | What are the strengths of the organization that to make use of external opportunities? | What are the weaknesses of the organization that make it difficult to difficult for it to profit from external opportunities? |
| **Threats** | What are the strengths of the organization that make it possible to fend off external threats? | What are the weaknesses of the organization that make it difficult to fend off external threats? |

Source: Tompkins et al. (2009, p. 3)

meant progressive or affirmative discipline, and it is still appropriate for certain problematic behavior. However, for some inadequate work output, an emphasis on learning, coaching, mentoring, or job shadowing may be more appropriate responses than dwelling on an employee's deficiencies (U.S. Office of Personnel Management 2010).

Also traditionally, more senior employees have been more knowledgeable and skilled than junior employees. The high-tech revolution has to some extent reversed the process, with junior employees learning more quickly the use of new software or hardware. A learning partnership may be a solution, where senior partners pass on their institutional memory and substantive knowledge, while junior partners share their tech savviness.

The use of work teams is a common approach to deal with the usual complexities of government work. It has received new attention in light of the increased complexities of the economy and society (Karoly and Panis 2004). Agencies recognize that they cannot be effective problem solvers by only using the resources of one department but could do a better job if they could draw on the expertise from other departments.

Homeland security is an example, where federal, state, and local governments pool their resources and create task forces to provide the best possible coverage in a region. This approach is also called matrix management, where the rows represent projects and teams, while the columns represent the individual departments (Hatch 2013, pp. 276–281). Leadership in life- and property-threatening situations can be organized using the incident command structure, which was developed by fire services in the West where major conflagrations were attacked using the resources of several jurisdictions.

Network governance is a more informal way of collaboration. It can be effective in dispersing new knowledge or acquiring a new understanding of best practices in an area. As with any organization, a network may function best and survive the longest, when the network has a hub leader or facilitator who does the steering and keeps the purpose of the network fresh in the members' minds (Goldsmith and Eggers 2004).

## Conclusion

Leading organizational innovations and serving the public interest can be challenging. It requires individuals with strong subject matter competence who enjoy managing complexity and thrive in the face of challenges; that is why they are called change agents. They are visionaries and good communicators to persuade others, superiors and subordinates in the organization, of the importance of their vision. Sometimes it also is a good idea to involve the public.

The challenges are considerable. Public administrators face an increasingly rapid pace of change, and innovations heralded as best practices in 1 year may experience declining relevancy a few years later. The expansion of social media channels is a case in point. Innovative, proactive leaders are well positioned to anticipate change and lead by steering compared to managers who use a reactive style. Considering the rate of change is not going to slow down, innovative leadership becomes more important at all levels of government and across jurisdictional boundaries.

# Leadership Across Generations

Jessica McManus Warnell
Department of Management, University of Notre Dame, Notre Dame, IN, USA

## Synonyms

Generations at work and leadership; Leadership and millennials; Multigenerational management

## Definition

Leadership across generations at work includes considerations of individual and organizational dynamics and processes, employee motivation and engagement, and related issues for and by workers from varying generational cohorts. Research suggests that explicit attention to the generations at work and to the challenges and opportunities of multigenerational workplaces and recognition of best practices in management and development of these employees lead to more effective organizations. While generational differences do not account comprehensively for the opportunities and challenges of leadership in today's workplace, understanding trends, capacities, and inclinations of generational cohorts can help employees at all stages of their careers work more cohesively and productively.

## Introduction

For the first time ever, people representing five different generations may be working side by side in our organizations. Research suggests that

explicit attention to the generations at work and to the challenges and opportunities of multigenerational workplaces and recognition of best practices in management and development of these employees lead to more effective organizations (McManus Warnell 2015). While generational differences do not account comprehensively for the opportunities and challenges of leadership and engagement in today's workplace, understanding trends, capacities, and inclinations of generational cohorts can help employees at all stages of their careers work more cohesively and productively. Moreover, creating connections among and fostering the contributions of multiple generations at work are best practices toward organizational productivity and success. Developing leaders who drive performance and impact of these organizations is critical. Shared leadership, in which employees at all levels of an organization positively and responsibly contribute to organizational success, is one feature of balanced and collaborative workplaces (Pearce et al. 2014). These collaborative leadership environments can lead to long-term benefit for individuals and for their organizations. This chapter considers the generations at work, with specific attention to the millennial generation which is poised to represent the largest group of employees in our organizations, and explores contextual issues for today's organizations and best practices for multigenerational leadership toward effective, ethical organizations.

## The Generations at Work

As older workers retire later and younger workers enter the professions in unprecedented numbers, today's workplaces often include representatives from four to five different generational cohorts. A significant group, the "millennials," who are generally defined as those born after 1980 but before 1995, will soon account for nearly half of the world's employees and by 2050 for 75% of the global workforce. The specific characteristics of the millennial generation are of particular interest to employers, policy makers, and others for several reasons.

Because this group will soon comprise the majority of the employees and leaders in our organizations, their sheer numbers will unquestionably influence work. In addition, our organizations are operating within a new paradigm of interconnectedness and technological advancement, and the millennial tendencies and experiences acutely reflect and magnify this changing nature of work (McManus Warnell 2015). Technology and related ubiquitous communication and information sharing is pervasive, and globalization is the new normal in which program partners, supply chains, consumers, clients, policy makers, administrators, investors, and other stakeholders operate in a connected world. Related issues of accountability and transparency multiply the reach, scope, and impact of generational characteristics and pose new opportunities and challenges for the workplace and its leaders.

As with most attempts to standardize the characteristics and experiences of large groups, scholars disagree on the specific boundaries, and some of the empirical data suggest contradictory characteristics. This variance within the research on the millennials in particular reflects their diversity. This is the most diverse group of emerging professionals – ethnically, by gender, and socioeconomically – ever seen in the United States (U.S. Census 2015). However, generalities can be useful tools toward maximizing professional and organizational effectiveness. Generational characteristics and their respective views and experiences of leadership do reflect some agreement.

A general consensus emerges around several key characteristics of the millennial generation to include this cohort's technological fluency and facility with social media, proclivity to multitask, teamwork capacities, preference for training and mentoring to reflect sustained and personal attention, desire for meaningful and fulfilling work, and increasing awareness of social and environmental sustainability issues (McManus Warnell 2015). Again, attention is rightly focused on this generation which numerically represents a proportion of our organizations – employees, managers, investors, consumers, and clients – that will be unmatched. There are nearly 90 million people in this age group in the United States alone.

The "baby boom" generation is typically defined to include those with birth years ranging from 1943 to 1964, and "Generation X" represents those generally identified as those born after the post-WWII baby boom, with birth years ranging from the early 1960s to the early 1980s. The generational cohort preceding these, called alternatively the Silent Generation, the Traditionalist, or the Greatest Generation, is represented by those born from 1930 to the early 1940s. The shared experiences of each cohort, particularly in their formative years, manifest in some consensus on views of work, relationship with authority, and conceptions of leadership.

Most of our organizations, of course, employ multigenerational workers. Contemporaneous with this influx of young workers, demographic data also reflects the realities of an unprecedented aging population, with the related longevity of active work life (Kulik et al. 2014). These diverse age cohorts are often working side by side and experience work in similar and dissimilar ways. A critical area to understanding leadership is considering how workers perceive and define it. Interesting differences emerge in employee perceptions of management and authority at work, and these perceptions influence understandings and experiences of leadership. Acknowledging these differences among those groups that comprise most of today's employees and managers is helpful to understanding leadership at work. "Baby boomers" and older members of "Generation X" are characterized as largely coming of age with a distrust of leaders and believing that the best work is performed without direct supervision (Howe and Hadler 2012). Millennials, conversely, tend to trust authority figures and look to them for guidance (Howe and Hadler 2012). These differences pose unique challenges for intergenerational effectiveness at work. Because millennials welcome a close relationship with supervisors and expect to contribute to organizational decision-making early in their tenure, these differences can manifest in various ways relating to perceptions of appropriate communication, interaction, and other processes and procedures in the workplace. These differences, when managed, can enhance leadership contributions from employees of all ages toward organizational goals.

## Best Practices in Multigenerational Workplaces

### Shared Values

Focusing on shared values is most productive for organizations made up of diverse generational cohorts. Though they may manifest differently, research indicates that millennials, Generation X, and baby boomers all share the same top five expectations of their employers, including challenging work, competitive compensation, opportunities for advancement and chances to grow in their jobs, fair treatment, and work-life balance (White 2011). These shared values can be a starting point for organizational cohesion and development and reflect opportunities for leaders to make meaningful contributions to realizing these objectives. The power of organizational mission and values is a related source of synergy.

The trajectory of today's workplaces is promising. Interconnectedness may come naturally to young talent; cultivating and appreciating these connections within and among the generations are distinguishing and important characteristics of millennials. Due to their upbringing, often characterized by close and participatory relationships with parents and other authority figures, millennials display the capacity to identify and be influenced by exemplars and respond to principled leaders, better than most of today's [older] adults could when they were young (Howe and Strauss 2000). Senior leaders can channel these traits and foster alignment with organizational goals. They can nurture this focus on shared values by articulating the message of the organization clearly and often. The role of senior leaders is explored further below.

Galvanizing around shared mission and values is critical for organizational success (Collins and Porras 1997), and differences do not preclude the development and pursuit of shared goals (Gentile 2010). Specifically, shared organizational goals can provide a common ground. These goals and the values that underlie them can be a foundation

to which employees and managers can appeal when identifying strategies and processes toward success. Emphasizing shared values can assist with effective decision-making and leadership activities at work along the continuum of professional experience (Gentile 2010). They allow us to consider effective strategies for pursuing shared goals; articulating and communicating these values is a first step, and modeling, incentivizing, and reinforcing them should follow (McManus Warnell 2015).

Shared goals are critical to organizational effectiveness and through collaboration they can be cultivated. Research acknowledges this link between values identification and measures of success. In the for-profit context, but relevant for public sector organizations as well, Beer et al. (2011) illustrate that looking inward, including the identification of organizational values, purpose, and capabilities, and aligning these with the passions of employees and with market opportunity, is a characteristic of high-achieving organizations. These emphases are in marked contrast to many organizations that begin by looking at markets and competition to determine strategy and direction. This characteristic of successful organizations, driven by those in supervisory positions, can benefit employees at all levels of the organization. Creating space for articulating purpose and values at work is the province of effective managers who acknowledge the connections between meaning, purpose, and organizational success.

These opportunities for personal and organizational values alignment are perhaps most acute and organic in public sector work. Research suggests that there are steps public service organizations can institutionalize to maximize achievement of employee and organizational goals. These include finding ways to reinforce the task significance of public jobs, with their unique access to intrinsic motivations linked to the significance of the tasks performed (Perry and Buckwalter 2010).

Wright et al. (2012) note that leaders in the public sector may be in a better position to activate these higher-order needs of employees, including the desire for connection with meaningful work, in ways that lead to success for the organization and its clients. Wright et al. (2012) also reinforce the notion that employees find their organization's mission to be most compelling when their leaders articulate the visions of this mission in clear and attractive ways. Consistent with research from the private sector (Treviño et al. 2000), successful leaders use their words and deeds to direct and inspire their employees and, importantly, model and reinforce behaviors that are consistent with that vision and mission (Wright et al. 2012).

Research finds that work "meaningfulness" is largely perceived by employees as related to perceptions of how their company treats others – thus, not only do employees care about how they themselves are treated by the organization, but they care more deeply whether their organization treats third parties (customers, consumers, communities) well (Glavas and Kelley 2014). Millennials are primed for both this connection with management and others and with values-based motivation. Thus, discussion of ethical impact provides a shared space where employees and their managers can interact, reflecting a key desire of millennial talent for both engaged and socially conscious work. Modeling and reinforcing these notions of purpose can belong to leaders at every level of professional life.

Identifying and reinforcing shared values is critical and requires dedicated effort; it also allows for a more participatory approach to leadership. Generational conflict often revolves around different understandings of how these values should manifest at work. Many potential challenges to intergenerational collaboration in leader-to-subordinate or peer-to-peer engagements can be mitigated by explicit determination, on the front end, of task and outcome expectations. Expectations and roles on the front end of shared tasks must be clearly determined, and the path toward achieving them requires collaboration and dialogue. Openness to different ways of thinking is invaluable to intergenerational effectiveness and allows for voicing ideas, questions, and approaches that can enhance the climate and effectiveness of the organization through greater engagement and transparency (Gentile 2010). Specific techniques can include explicitly naming

shared goals and values, including but not limited to organizational mission, in collaboration with colleagues and with attention to differences in respectful and open ways. The emerging models of flatter organizational structures rather than the purely hierarchical approach, and greater interest in and potential for interaction with aspirational leaders by employees at all levels, facilitate this intergenerational dialogue and collaboration (McManus Warnell 2015).

### Loyalty and Motivation

Considerations can also include shifts in the definition and importance of loyalty over time and related issues of life stage differences. Stages in life of the generations at work, such as early, mid-, and late-career progression, and family and other roles and responsibilities through life's trajectory, of course, vary and manifest in differences in motivation, definitions of commitment, and receptiveness to rewards and incentives. For example, new hires with significant student loan debt have very different priorities than mid-career new parents or than more senior-level employees who may be caring for aging parents of their own. Recognizing these differences, perhaps through explicit attention to them in respectful ways in collaboration with employees at all levels, can mitigate misunderstanding by appealing to understanding and appreciation for others' experiences. Belias and Koustelios (2014) note that job satisfaction is related to perceptions of working environment, relations with colleagues, and institutional goals, strategies, and success criteria; preferred styles of organizational culture are related to demographic characteristics including gender and age. It is a disservice to avoid recognizing these different experiences. Measuring and analyzing organizational culture in the context of employee demographics, explicitly considering factors such as age and life stage, can increase job satisfaction for all.

Motivation is critical to engagement and experiences and expressions of leadership, at all career stages. Kanfer and Ackerman (2004) note that process-oriented formulations of motivation at work often emphasize effort and time, rather than knowledge, as the resources that individuals allocate to determine the direction, intensity, and persistency of work behavior. For older workers with substantial knowledge, time and cognitive effort may be in shorter supply; the opposite is true, however, for younger workers. The most effective motivational interventions for midlife and older workers may be those targeting utilization and distribution of relevant knowledge and experience, and interdependent team environments may be a particularly beneficial context for facilitating work motivation (Kanfer and Ackerman 2004).

Motivation and loyalty are linked. Loyalty at work can manifest in many ways, and research suggests millennial employees experience loyalty to interpersonal relationships rather than to positions or organizations; accordingly, supervisor and other connections are critical (McManus Warnell 2015). These connections can only be fostered through intentional effort on the management's part. Coaching, collaboration, and recognition of the joys and challenges of various life changes are key. Labor projections reflect the age, gender, and ethnic diversity of our workplaces, which will only increase (Toosi 2012). Considering how loyalty, motivation, and connection are experienced and understood is necessary for effective multigenerational workplaces. Van Meter et al. (2013) note that millennials tend toward higher idealism and relativism; though they acknowledge some variation within the cohort, managers would do well to acknowledge the changing nature of reporting of misconduct, increased interconnectedness among employees and with those outside of the organization which has implications for experiencing and sharing ethical concerns, and more relativist understanding of ethical behavior at work. The traditional lecture-based approach to ethics and compliance training may also be ineffective, and more engaging pedagogy should be considered as millennial employees become the majority (Weber 2014).

In addition, research on management best practices reflect approaches in which millennial talent may be positioned to excel and acknowledges that engagement with their multigenerational colleagues is necessary for success. Thus, authority

is not necessarily conferred by title, subordinates' respect and trust must be earned, and supervisors must demonstrate to their subordinates their own character and competence before those subordinates are likely to follow (McManus Warnell 2015).

Organizations are successfully incorporating these techniques of explicitly naming multi-generational differences and collaborating around and modeling solutions. Examples include presentations on the generations at work, diversity councils around generational differences, training videos or readings exploring bridging the differences, and group meetings with required attendance by employees at all levels of the organization. Senior leaders can thus acknowledge possible differences explicitly and collaboratively by facilitating discussions of generational differences, presenting guidelines for effective engagement, and reinforcing respectful dialogue. In organization-wide meetings, content can include not only project updates and responsibilities but recognition of milestones including positive results for clients, personal milestones like new babies or graduating children, and other important professional and personal events – this reinforces connections and fosters appreciation for the challenges and joys of various life stages (McManus Warnell 2015). Acknowledging, coaching, and celebrating performance should be part of the process to reinforce expectations, norms, and values. These occasions become additional opportunities for engagement.

Chung et al. (2015) suggest that loyalty behaviors can be enhanced in diverse workforces by actively creating a favorable diversity climate, including such considerations as establishing bias-free human resource management practices for recruitment, hiring, and performance evaluation, training and education programs that help build a positive environment for those from diverse backgrounds, and senior management's attention to the values of diversity. This type of supportive diverse work climate is shown to reduce negative impacts of and increase positive outcomes associated with worker differences (Chung et al. 2015).

**Tone at the Top and Leadership at Every Level**

The role of senior managers in cultivating organizational culture, identifying priorities, and fostering a culture of engaged employee contribution cannot be overstated. Through fostering relationships of trust, empowering employees through inclusive decision-making, and encouraging employee growth and success, ethical leadership, and values-driven value creation, leaders encourage their employees to contribute to organizational success (Christensen et al. 2014).

Senior leaders can enhance employees' physical, cognitive, and emotional resources available for the pursuit of organizational objectives when they generate enthusiasm, energy, and commitment, by collectively influencing employees' perceptions of group efficacy and by encouraging followers to rise above self-interests in pursuit of organizational values and goals. Through inspirational motivation and idealized influence, these leaders convey values-based visions that result in enhanced congruence between values of the organization and its employees (Barrick et al. 2015). When the values, goals, and objectives of individuals are more aligned with those of their organizations, individuals are more willing to make themselves available to engage in work (Barrick et al. 2015).

Effective decision-making and leadership in the context of today's global, economic, and sustainability challenges require principled reasoning. Considerations of objectives across the triple bottom line of economic, social, and environmental impact by the organization can be a natural space for these approaches to flourish. Credibility is a precursor to leading and consensus building, and effective policy and strategy decisions must be rooted in principle for their institutionalization and impact (McManus Warnell 2015). Ethical conduct will be a competitive advantage in this era of globalization and transparency in which the stakes are high. Discussion of ethical impact provides a shared space where employees and their managers can interact. This attention reflects a key desire of today's workers, perhaps most acutely the millennials but an opportunity for all employees, for both engaged and socially conscious work.

In addition to reinforcing shared personal and organizational values, senior leaders can express and model the sentiment that all workers are value-added colleagues from the start. This approach fosters a norm of mutual respect that can be expected from workers, particularly young employees, but for workers at all levels of the organization, in return (Eisner 2012). Research on best practices in management finds that preparing for the realities of leadership includes recognizing that authority is not conferred by title, rather by interdependencies and expression of mutual respect and trust, and that subordinates are more likely to follow leaders who demonstrate their own character, competence, and abilities, not those who simply demand allegiance to following orders (Murray 2009). Managers do well to nurture a commitment to shared goals, not to blind allegiance (Murray 2009).

All stages of the professional process – recruiting, hiring, training, and development – can reflect the recognition of efficacy and dignity of workers at every level. This approach is reflected in increasing attention to collaborative organizations with flat rather than hierarchical structures (George and Baker 2011). This perspective resonates strongly with the strengths and preferences of millennials, soon to represent our greatest number of employees, and is the emerging model of today's organizations.

Organizations can develop a broad array of leaders, not simply a select few. As organizations consider strategies to recruit and retain top talent from the group representing the majority of the pool of available workers, they do well to recognize that these millennials desire to contribute, express comfort with interaction with those in authority positions, and desire to be taken seriously as contributing members of the group (Myers and Sadaghiani 2010). Again these characteristics can be a net positive for organizational success. Authenticity and institutional values are important to all workers; millennials in particular have a comfort with technology that enables them to access information and resources creatively and easily and to function successfully in a world that is without boundaries; and they are largely people- and organization-oriented rather than alienated, which bodes well for engaging them around mission and goals (Hershatter and Epstein 2010).

Both new workers and experienced professionals will benefit from clear dialogue around expectations and contributions, as well as reimagining notions of teams and leadership. In addition to pursuing clarity and collaboration at the outset and along the way as described above, a useful approach to fostering multigenerational collaboration at work involves presenting guidelines for effective engagement. Addressing the nature and characteristics of the tone and tenor of the interactions themselves is important. This method of engendering intergenerational collaboration involves conversational learning, which starts with shared agreement around putting the organization first. Conversational learning also includes awareness that we all have biases and "blind spots" and acknowledging an open-mindedness to learning from others, a conscious effort to listen, and an agreement that engagements be characterized by self- and other-respect. This foundation can be presented and modeled to employees in the context of training, development, peer coaching, and other activities (Sims 2012). Managers can encourage reflection and values alignment explicitly through training and development opportunities. Other examples include leader-led and group mentoring, engaging with aspirational role models, and clear feedback loops.

In addition, senior-level management adopting an engaged leadership style is shown to be associated with engaged employees; this engagement, or employees' willingness to fully invest themselves into work roles, physically, cognitively, and emotionally (Kahn 1992), is associated with positive individual- and organizational-level performance outcomes (Barrick et al. 2015). Collaborative, engaged leaders can more effectively cultivate employee commitment, development, and leadership toward organizational goals. The exhibition of transformational leadership, characterized by those behaviors such as sharing compelling visions, stimulating followers intellectually, and setting challenging goals and

expectations, can be used to create sustained organizational success (Barrick et al. 2015). This leadership approach can be considered an antecedent of collective organizational engagement by influencing meaningfulness, defined by Kahn (1992) as a feeling that the worker is receiving a return on the investment of physical, cognitive, and emotional energy by feeling useful, valuable, and not being taken for granted; that one is necessary and important; that much is expected of him or her; and that he or she is making a difference, which is influenced by task and role characteristics and by work interactions (Barrick et al. 2015).

To foster engagement and cultivate leadership at all levels, companies can allow for consistent accessibility and connection with senior management. Some companies suggest the physical act of managers walking around the organization and a literal "open door" policy; others create online portals that function as modern-day suggestion boxes. Here, we can consider the concept of highly present role models (Eisner 2012) as an effective mantra. Other suggestions include leveling the value of all workers by avoiding signaling inaccessibility of senior leadership in the physical space of the organization; consideration of approaches such as "reverse mentoring," perhaps in the area of technology, where astute millennials can mentor their more experienced colleagues on technological tools and trends; and recognition of service anniversary awards.

While physical proximity between employees and their supervisors is not always feasible, mental or emotional proximity is essential (Groysberg and Slind 2012). This accessibility and connection, reflected in the approach called conversational leadership, reject the "command and control" approach to management – an approach that appears to be ineffective with millennial talent and is increasingly becoming obsolete. Globalization, technologies, changing notions of value creation, and interaction with customers and clients have led to a sharp reduction in the efficacy of exclusively directive, top-down leadership (Groysberg and Slind 2012). Today's most successful organizations are characterized by the nature of communication within them – the flow of information to, from, and among employees – which is more dynamic, sophisticated, and reciprocal (Groysberg and Slind 2012).

The technological context also has relevance to communication approaches. Top-down, one-way communication has become unrealistic and inefficient; for just one example, with the advent of social media, all employees have a public voice, and leadership must adjust accordingly. With explicit attention, managers can leverage this new reality toward positive organizational development (McManus Warnell 2015). In addition, economic changes that prefer knowledge work requiring more sophisticated communication; organizational change that reflects flatter and less hierarchical structures involving lateral and bottom-up communication; globalization that requires fluid and complex interactions; the influx of young talent with a preference for dynamic, two-way communication with peers and their superiors; and technological changes that render static communication obsolete mean that the nature of interaction at work must change (Groysberg and Slind 2012).

Within the technology sphere, scholars have identified elements of organizational communication that are critical for navigating this new paradigm. These characteristics include intimacy, or leaders emphasizing listening to employees rather than speaking to them and bottom-up exchanges of ideas with employees; interactivity, or leaders using social and other media tools to facilitate two-way communication and employees interacting with colleagues on such tools as blogs and discussion forums; inclusion, or leaders involving employees in communicating the company's story and in acting as organizational ambassadors and thought leaders; and intentionality, or leaders building messaging around organizational strategy and employees taking part in creating this strategy (Groysberg and Slind 2012).

The influx of young workers and their ascension to leadership positions bode well for all generations at work when the best of their inclinations and motivations are channeled toward organizational goals and when the interactions across the generations are characterized by a mutual respect and willingness to engage. Innovation thrives

when information is readily and consistently exchanged, when employees are engaged and connected, and when decision-making is inclusive. These characteristics align well with millennial capacities and preferences, and to compete for the best young talent and to operate most effectively in today's climate, organizations do well to embrace them toward success for all (Agan 2013). Millennials and their more experienced colleagues can be encouraged to be active participants in decision-making and communication exchanges. Young talent can acknowledge experience and organizational wisdom as essential to workplace success, and experienced workers can share their knowledge, embrace the gifts of employees at earlier stages in their careers, and signal willingness to collaborate and perform together.

## Conclusion

Leading across generations in today's organizations involves recognizing demographic and contextual changes. Best practices in management and organizational effectiveness are key, including recognition of generational differences; acknowledging, cultivating, and reinforcing shared values; encouraging and recognizing the value and contributions of employees at all levels of the organization; recognizing the impact of collaborative and transformational leadership; and practicing conversational and collaborative interactions and performance toward organizational success. Cultivation of collaborative and transformative leadership environments can lead to long-term benefit for individuals and for their organizations.

Necessary considerations include explicit attention to shifts in the definition and role of work motivation and loyalty over time and related issues reflecting life stage differences, both of which can be actively managed toward individual and organizational goals and alignment. Different manifestations of motivation, loyalty, and leadership that may characterize generational cohorts do not preclude shared individual and organizational values, which can serve as a foundation to which leaders at all levels can appeal. Organizational culture and climate start with those in senior leadership positions; in addition to reinforcing shared personal and organizational values, senior leaders can express and model the sentiment that all workers are value-added colleagues from the start. This approach fosters a norm of mutual respect that can be expected from workers at all levels of the organization in return. When workers are engaged and connected and leadership is participatory and collaborative, multigenerational employees and their organizations can flourish.

# Leadership Across Hierarchical Levels

Heather Getha-Taylor
University of Kansas, Lawrence, KS, USA

## Exercising Leadership Within Hierarchy

Understanding leadership requires attention to the ways in which organizational structure influences its practice. Leadership can be conceptualized as a product of organizational or group influences, including the power relationship that exists as a result of hierarchy, or as an individual's characteristics or behaviors. Northouse (2010) defines leadership as "a process whereby an individual influences a group of individuals to achieve a common goal" (p. 3). The execution of this process is strongly rooted in organizational structure.

Division of labor and hierarchy is one way that organizations meet the goal of organizing work to achieve goals, including goals for effectiveness, conformity, use of power, and decision-making (Hall 2002). The view of organizations as systems that are dependent on hierarchy for order and stability has its modern roots in the work of Weber (1947). Weber's description of the ideal type of bureaucracy focused on hierarchy and limited authority, division of labor, procedures and rules, as well as an emphasis on rewards to differentiate levels of competency. These features serve to create and reinforce command-and-control approaches to management.

Within hierarchical organizations, two key distinguishing elements impact the practice of leadership: the pressures for specialization and integration, which exist simultaneously. Specialization allows individuals to focus on a limited range of tasks that match their abilities, roles, and preferences. Staber (2013) describes specialization as a "key characteristic of highly structured bureaucratic organizations where the boundaries of authority and responsibility are clearly demarcated" (p. 146). Specialization, then, determines the location and jurisdiction of leadership. Yet, attention to specialization

introduces an element of complexity, which requires a high degree of coordination (Hall 2002). Some attention to attaining "unity of effort" is therefore needed for effectiveness in hierarchical settings (Lawrence and Lorsch 1967). This integration is an important starting point for the possibility of leading across hierarchy.

Hierarchy coordinates the work of large numbers of people by specifying lines of authority and accountability when direct oversight is not possible. Hierarchy as a structural form provides recognition, status, and power to those in leadership positions. It can even make some people feel more important than others, which may have manipulative consequences. This potentially negative implication of hierarchy is not the only one. Rather, other consequences of this structural form can include communication gaps, overlapping responsibilities, duplication of effort, and delayed decision-making (Staber 2013).

For these reasons, leadership via hierarchy is not without critics. For example, Barnard's (1938) work addressed the competing needs that exist within a formal organization, including the need for individual cooperation that spans organizational units (and, we can elaborate, formal positions of authority). Connected to this, Burns and Stalker (1961) advocated for a more "organic" form of organization, which emphasizes a network approach – over a hierarchical one – for sharing information and achieving outcomes. Together, these contributions speak to the importance of understanding the opportunities and constraints presented by the environment for leadership.

The environment for leadership has undoubtedly shaped both the study and practice of leadership. Scholars have often based their studies – and resulting theories and concepts – on assumptions of hierarchical settings. For example, efforts to identify the traits, skills, styles, and behaviors that differentiate effective leaders are predicated on the expectation that it is easy to identify leaders within organizational settings. Explanations of leadership are largely shaped by assumptions of leaders existing within bounded, hierarchical structures where a formal leadership position conveys power and the ability to shape individual actions and organizational outcomes.

For example, Katz (1955) work presented three types of skills (technical, human, and conceptual) that impact the effectiveness of administrators. According to Katz, leaders in top positions need enhanced conceptual and human skills while frontline supervisors need greater technical skills by comparison. The common thread from this work is that leaders should strategically focus on the most essential skillsets based on their position within the organization. Similarly, Burns' (1978) presentation of transformational leadership highlighted the shortcomings of the more dominant, traditional approach: transactional leadership. Transactional leadership is based on the exchanges that take place between leaders and followers within organizations to influence behavior. The success of this approach rests on the ability to reward and/or punish subordinates, which depends on the exercise of reward and coercive power (French and Raven 1959) that typically resides within formal positions of authority.

From the perspective of institutional theory, organizations tend toward greater formalization over time, which may include additional focus on hierarchical structures. This evolution may reduce an organization's flexibility and responsiveness (Staber 2013), which can present an opportunity for new forms of leadership to overcome these consequences. From this perspective, the opportunity for *leadership across hierarchy* may reflect a greater desire for "connectivity" over specialization (Kolb 2008) and also represent a contrast between the formality of hierarchical structures and the push for more informal relational mechanisms to accomplish goals.

## Exercising Leadership Across Hierarchy

Highly centralized, hierarchical organizations concentrate decision-making to a limited number of participants, or leaders. Leading across hierarchy challenges the foundational principles that define this organizational form: "If the bureaucracy is to operate successfully, it must attain a

high degree of reliability of behavior, an unusual degree of conformity with prescribed patterns of action" including "a keen sense of the limitation of one's authority and competence" (Merton 1968). By contrast, less centralized organizations invite a greater level and number of participants (Hage 1980). Decentralization opens the practice of leadership to those existing outside the traditionally powerful organizational positions (i.e., at the top). A variety of forces influence the level of organizational decentralization, including organizational size, technological advancements, and environmental considerations (Hall 2002).

According to Nahavandi (2012), major shifts are transforming the ways in which organizations are structured, including their degree of centralization and hierarchy. "With the constant need for innovation, intense global competition, changing demographics, and reliance on teams, organizations and their hierarchies are changing drastically." (p. 16). These shifts are not limited to any particular organization or sector. Specifically, in the public sector, several key developments revealed the need for leadership across hierarchy.

To begin, the New Public Management movement of the 1990s emphasized streamlining agencies and the public workforce to provide a government that "works better and costs less" (National Performance Review 1993). The associated restructuring not only cut the size and reshaped the federal government but it also introduced enhanced expectations for employee empowerment in decision-making. With the broad cuts to middle-management layers, initiative and leadership behaviors among lower-level workers became essential rather than tasks reserved for the top layers of the civil service.

Related to this, growing attention to the need for leadership development throughout organizations – not just at the top – called into question the appropriateness of leadership based on position alone (National Academy of Public Administration 2008). Further, the rise of contracting and collaborating with other sectors to solve problems and meet demand for services without growing the size of government also introduced change. Public managers are increasingly tasked with oversight and discretionary functions as well as expectations to lead across organizational and sector boundaries (Voelz 2010).

These and other complex challenges require new ways of leading. And the mindset necessary to address these challenges differs considerably from hierarchical thinking (Linden 2010). While working through hierarchy demands management, control, and focus on formal authority, leadership across boundaries requires relational thinking, partnerships, flexibility, and working together to deliver results. However, a variety of forces stand in the way of effectively leading across hierarchy. Structures, processes, and individuals often resist change and can hinder these efforts. Leading across hierarchy requires both individual persistence and organizational support.

If valued by both employees and employers, there are a number of potential valuable outcomes associated with leading across hierarchy. First, those individuals with the needed resources to address a given problem can be involved in identifying a solution, which may not be limited to those in top leadership positions (Reiter-Palmon and Illies 2004). Second, leadership across hierarchy may provide more flexibility and responsiveness than hierarchical structures can allow (Maccoby 1991). Third, developing leaders across levels of an organization can contribute to a strategic human capital focus on workforce development that values individual growth and investment in people over time (Selden 2009).

At the same time, this approach introduces several potential challenges as well. First, leadership across hierarchy may not be sanctioned by organizations. Second, leadership across hierarchy may be an indicator of deeper cultural problems that result in "guerrilla government" (O'Leary 2013) actions in which individuals take initiatives that are aligned with their individual ethical values but not prescribed by their organization. Finally, the expectation of leading across boundaries may simply be seen as an indicator of a "new deal" between employers and employees (Cappelli 1999) that reflects uncompensated and potentially unwelcomed extra responsibility.

## Looking to the Future: Leading Within *and* Across Hierarchy

While contemporary forces highlight the value of leading across hierarchy, leading within hierarchy will remain an important feature of delivering public services through existing government agencies. In short, public employees of the future will increasingly be tasked with leading both vertically and horizontally. Within their organizational home, leaders in positions of authority will still need to motivate and influence others to achieve goals. At the same time, they will need to lead across organizational and sector boundaries to solve shared problems (Linden 2010).

Key to achieving this balance will be attention to the necessary skills, behaviors, and mindsets that will support different leadership needs. Research confirms that leading within and across hierarchy requires different leadership approaches (Silvia and McGuire 2010). Helping leaders develop the essential skills for both tasks may require investments in mentoring and training. However, mentoring or training alone is insufficient. According to Morse (2008), "The leader whose very character is rooted in command-and-control, top-down models of leadership may very well be able to learn the skills of collaboration, but it is unlikely those will be translated into behaviors" (p. 96).

In addition to balancing the need to lead within and across hierarchy, leaders will need to welcome and support the exercise of leadership by others. As Cappelli et al. (1997) note, the contemporary focus on work teams shifted the roles of supervisors and employees in important ways. This transition can offer valuable lessons in the context of leading across hierarchy as well. Namely, in the transition to work team environments, supervisors evolved to serve as coaches or facilitators rather than as authoritarian directors. In some settings, teams became self-directed, and supervisors were not necessary. Overall, this transition speaks to evolving views on shared ownership of leadership tasks and responsibilities as well as changing organizational structures (p. 92).

As noted previously, structure is essential for coordinating work, defining roles, and determining decision-making power within organizations. As a result, an organization's structure can reveal important lessons on the ways in which leadership is defined and practiced. Structure and culture reinforce one another, and together convey the norms of leadership. For example, Staber (2013) wrote "The structure provided by roles, rules, and authority is expected to enhance control and predictability, but it can create its own problems if people use the existing structure to resist change, push their personal interests, or sabotage leadership initiatives." (p. 144). Leadership across hierarchy can be seen as a force for change and movement that counters authoritative leadership, which focuses on providing order and consistency which is valued in hierarchical organizations (Kotter 1990).

Traditional means of leading within organizations rested on an individual's position or reward power as conveyed via organizational structures and systems. The use of hierarchy offers an organizational mechanism for systematically ordering positions, functions, and individuals. Hierarchy prioritizes chain of command, stability, predictability, and efficiency. Yet, individuals must increasingly work across functional areas to coordinate work often without formal authority or influence (Parker 2008). While leading within hierarchy involves an emphasis on formal authority, controlling communication, and power via senior leadership positions, working across hierarchy requires different techniques and mindsets. Namely, leaders work effectively across boundaries when they lead rather than manage, achieve shared goals via relationship building, and build trust and open processes that contribute to mutually beneficial solutions to problems (Linden 2010).

While leadership across hierarchy is increasingly needed to respond to the challenges faced by contemporary organizations, Cappelli's (1999) work on changing elements of the employment relationship introduces some other potential concerns that should be considered. As organizations embrace an era in which vertical and horizontal leadership is needed to meet goals, it is important to reflect on whether these expectations are met with sufficient organizational support. Are these

expanded leadership roles matched with reciprocal resources, rewards, or commitment from the organization to recognize the value of these efforts? While organizations may benefit from the efforts of individuals who lead effectively within and across hierarchy, it is unclear if this contemporary expectation is a mutually rewarding opportunity or a one-sided benefit.

## Synonyms

Government agencies; Public organizations; Senior managers

## Definition

Leadership in public organizations is learned through practice. The accumulated experience of managers in government organizations can lead to both knowledge and a set of skills that senior managers can draw on when making strategic decisions. This is called the leadership repertoire.

The last decade witnessed much hand-wringing among business school academics about whether leadership can be taught to aspiring business leaders with only limited experience in the business world. Six prominent management professors at top business schools all agreed that leadership can be learned (Doh 2003). But they differed in describing if and how leadership can be taught. A similar debate has not occurred in public affairs programs despite the fact that various surveys of graduates of public affairs programs after five years or more show that soft skills including leadership are mentioned for their prevalence in day-to-day work even though many of the respondents were disdainful of the soft skills that they suffered through as 24-year old graduate students. While leadership may have second class status in graduate public affairs programs, there is a flourishing leadership industry despite the lack of evidence that it is very effective in teaching, training, and producing leaders (Kellerman 2012). Drawing on analogies from comedy, the essay shows that leadership can be learned if one considers the challenge as the creation and expansion of a *leadership repertoire* that begins in the classroom but is then cultivated experientially through practice over an entire public service career. Developing a leadership repertoire is akin to learning craft skills and then refining them over time. This approach avoids the sterile argument as to whether leadership can be taught and replaces it with one that anchors leadership education in public affairs in a method that has served skills development in myriad occupations and professions.

Preparing teachers and social workers has elements of a craft via the student teaching requirement as part of university education programs and the required field placements as part of the master of social work (MSW) degree. Public affairs education is not that different. Vining and Weimer (2002) make the observation that, like all crafts, policy analysis requires both instruction and practice. When learning and practicing craft skills, Weimer (2012) comments that it includes a blend of universal knowledge and skills that are particular to a given context. Universal craft skills include the ability to frame policy problems, the ability to identify the most salient values pertinent to the particular problem, developing alternative ways of responding to, and ultimately solving the problem and offering prudent recommendations. But other craft skills are particular and apply to the specific situation under review. Nurturing one's policy analytic craft requires a deft integration of both universal and particular craft skills for, in most policy contexts, both will be relevant.

James March, one of the foremost organization theorists in modern history, alluded to leadership as craft (Podolny 2011). March observed that leadership is a combination of plumbing and poetry or to put it another way, perhaps more art than science. In responding to the question of whether leadership matters, March said,

> Absolutely. It is the joy, passion and beauty that we infuse into life that is the glory of the human species. I think leaders can contribute to that joy—and to its extinguishment. I think administrative memoranda should be constructed as works of poetry, that organization charts should be exquisite pieces of sculpture, that relations between a boss and a subordinate should have the qualities of a Balanchine ballet. (Podolny 2011: 503)

The role of creativity and imagination are integral parts of leadership development thereby eschewing a "one best way" or style of leadership. In a speech to entering graduate students at Johns Hopkins' School of Advanced International Studies, entitled "Education for Leadership," Elliot Cohen observed that, while there are real limits to how leadership can be learned in the classroom, observation and emulation through biography, great literary works, and even film offer valuable lessons for leadership (2002). Still, real leadership education occurs not primarily in the classroom – though exposure to leadership is certainly worthwhile – but rather through practice which can then create real learning about leadership (Van Wart 2003; Van Wart 2013).

Blunt (2004) points out that one way to grow leaders is to learn from the examples of others – leadership exemplars. He adds that challenging assignments and setbacks contribute further to leadership development which is essentially on-the-job training (Blunt 2004). Blunt envisages leadership development very much as a

combination of learning, observing, and doing. Leadership development is, for him, action oriented. While concepts, theories, and, even more so, stories are all useful, *doing* trumps them all.

The above observations suggest that leadership is similar to other areas of human development where one learns through practice in formal positions of authority in bureaucratic organizations. The challenge for potential leaders is to develop a repertoire from which the public official selects at the appropriate period of time. Viewed in this way, developing a leadership repertoire is similar to the approach found among a wide range of professions. A brief analogy to a fledging young comedian will illustrate the point.

## The Concept of Repertoire

Developing a leadership repertoire can be understood through an analogy to comedy. Imagine a person in the early stage of a career as a comedian. The comedian starts by building a set of jokes, anecdotes, gags, and stories. These represent the comedian's initial repertoire which is then practiced in venues such as open mic, comedy workshops, and small bars and clubs. The comedian's performance selects from the repertoire. While the comedian's act is very similar from one performance to another, it is rarely identical. The act changes during any given performance when the comedian alters the repertoire. The changes may include substitution of some material, elimination of some, or simply changing the order of the material. The comedian alters the repertoire because he has a hunch that a change is needed to be successful for *that* particular performance. Alterations in the repertoire are based on experience and educated guesses about what will work in the current environment. The comedian has no guarantee that a selection from the repertoire will be successful. In fact, failure is part of the learning process. When a comedian notes that he "bombed," he takes stock of what happened and why the routine did not work that evening. The comedian learns from each experience and incorporates the learning into future repertoire decisions. To generalize beyond the comedian, an essential feature at this point is *adaptability* – a necessary condition of effective leadership according to former Chief of Staff of the United States Army General Martin E. Dempsey (Hargrove and Sitkin 2011).

Learning and repertoire development can be reinterpreted in a more precise way. The comedian reflects on the jokes, gags, and stories that work (and those that did not produce the laughter from the audience) and begins to formulate a "theory" of humor. The theory is also part of the comedian's repertoire since it guides the selection of specific gags, anecdotes, and stories. For instance, some jokes work because people laugh at unexpected juxtapositions, that is, thoughts and ideas that seem to have inappropriate connections. One element of humor, then, is incongruity. Other jokes work because the comedian can disparage both ideas and people without reprisal from the audience. The incongruity comes from the fact that the comedian can say things on stage as part of the act that would not be acceptable if said face-to-face when the comedian is not performing. A third idea learned from reviewing jokes and gags is that people laugh at mechanical representations of the human being, sight gags if you will. Visual characterizations often produce laughter from the audience. And fourth, comedy has a psychological dimension: people laugh when aggressive ideas are expressed in an unserious way.

Our new comedian looks at the repertoire of jokes, stories, and gags and discovers that what works confirms this theory of humor. The comedian uses the theory – essentially the four principles listed in the previous paragraph – to refine the set of jokes, stories, and gags in the repertoire. Notice that the refinement is not arbitrary; what works (and what does not work for the comedian) is based on the theory of humor that is tested each night when the comedian goes on stage to perform the act.

If one eschews the notion that leadership is like physics – meaning science – but rather like the road travelled by comedians, one can perhaps make sense of what it means to develop a leadership repertoire. Public management has attributes that are analogous to theory-driven humor. The

manager strives to be as effective as possible. Like the comedian, the public manager builds a repertoire of concepts and skills and employs them in particular contexts. These include but are not limited to ways to lead, ways to collaborate, ways to negotiate, methods to assess personnel, and program effectiveness, to name a few. The repertoire is not random; rather, it is derived from theory about what seems to work in general, and what alterations are needed in light of the particular constellation of environmental conditions (Van Wart 2013). When new comedians study the performances of seasoned comedians, they are really observing the application of theory-driven humor. The seasoned comedian makes intelligent selections from a well-developed repertoire. The novice comedian can learn from the seasoned comedian's theory-driven approach, but it would be unwise for the novice to literally copy the former's repertoire since context and personality could render too literal an application unfunny. How does an aspiring public manager with little professional work experience begin to develop a leadership repertoire?

## Leadership Competencies

One approach is to think of leadership as a set of competencies akin to those that have been identified as Executive Core Qualifications (ECQs) by the United States Office of Personnel Management (OPM) (https://www.opm.gov/policy-data-oversight/senior-executive-service/executive-core-qualifications/). Competencies are formed from the overlap of skills, individual characteristics, and knowledge. They are learned through education and training, and, most importantly, through experience. Competencies like the ECQs can be thought of as the accumulation of repertoire that is grouped into broad categories for managers who aspire to the Senior Executive Service (SES) of the federal government. The leadership journey begins early in one's career and is shaped over years of practice.

Consider some fundamental competencies that have been identified by OPM. These initial competencies tend to focus on self-reflection, communication skills, interpersonal skills, and ethical reasoning. Various self-assessment tools designed to connect one's psychological profile, mode of interpersonal interaction, and communications skills are typically introduced early in leadership education. A useful way to think of the fundamental competencies introduced in early leadership education is to use the "stair step" approach that presumes increasing leadership responsibility over a career that begins with managing projects, continues to managing people, followed by managing programs, and finally, leading organizations. Each leadership step includes a group of competencies. The ECQs assume that competencies are learned over many years of experience. Moreover, repertoire development and the accumulated competencies do not align quite as neatly as suggested by the stair step imagery embedded in OPM's classification of leadership competencies at different stages in one's career.

Consider some of the competencies involved in managing projects – the first step in one's leadership journey. Here is where much of what is learned public affairs programs provide the grist for core management responsibilities and are necessary but not sufficient for those who will continue to climb the stairway. While a distinction is often drawn between management and leadership, the distinction can be artificial and this is recognized by OPM by identifying "business acumen" as a core leadership competency. Managing projects, with the associated focus on creating and motivating teams, performance measurement, and even a bit of vision – a competency associated with a much more senior level of leadership – is needed for someone who is developing a leadership repertoire even relatively early in one's career.

There are no fine lines between leadership competencies and a stairway progression to higher levels of leadership. Rather, experience provides the opportunity to both learn skills and develop one's repertoire. Leadership competencies in public bureaucracies frequently include activities around managing projects and extend to managing people. Motivating personnel to appreciate the organization's "big picture" –

generally described as the mission – requires senior leadership to not only manage performance detail but to also instill a service orientation in the various teams and occasionally manage conflict as well. Notice that as competencies are developed, the leader needs to move back and forth across the steps by reaching into one's repertoire learned and practiced at an earlier time in one's journey.

A key part of a leader's repertoire in large bureaucracies is to develop and share a vision for the organization. This is one way that leaders create followers. Vision suggests purpose and direction. Yet, a vision offers no guarantee that it will be embraced by all of the key stakeholders. In public bureaucracies, it is essential that the leader understand the internal dynamics of power to gauge support for his or her vision and build support for change (Fernandez and Rainey 2006). As Kotter (2001) pointed out, since leadership involves change, it requires aligning people to achieve your vision. Vision may be necessary but it is certainly not sufficient to achieve success. The leadership stairway suggests as much by noting that competencies learned earlier in one's career are also important when trying to lead change in large bureaucracies. For example, since there is likely to be some resistance, managing conflict and employing political savvy, two additional ECQs learned and practiced earlier in one's leadership journey, are necessary when leading change. It also helps to understand the organization's culture and, if it is a large organization, several cultures (Shalala 1998).

Strategy is an important element of leadership. Strategic thinking is associated with the highest level of leadership – leading organizations. However, strategy first requires a mindset which also includes barriers to strategic development in public organizations. As such, strategy is not a single competency but, rather, a conglomerate of competencies that also require a large repertoire if the leader is going to be successful. Practicing strategy can begin early in one's career by first learning about some of the inherent obstacles to strategic thinking and ways to counteract them (Roxburgh 2003). Similarly, exposure to models and alternative perspectives are useful such as Moore's strategic triangle (Moore 1995), Porter's five forces (Porter 1996), and Minzberg's concept of emergent strategy (Mintzberg 1994). Exposure to strategy through learning, for example, through case analyses or direct observation of strategy formulation and implementation in selected public organizations, can help to establish the learning platform early in one's leadership journey.

Recognizing the difference between what is routine and what is not routine is a key element of one's leadership repertoire. Technical challenges such as the allocation of a significant budget cut across an organization, while always painful, is a function of management. Leadership focuses on adaptive challenges. This is a distinction that has been formulated by Ronald Heifetz at the Harvard Kennedy School of Government and his colleagues (Heifetz 1994). In a brief review of Heifetz's work, the Australian Public Service Commission, in a compendium of leadership concepts and theories, summarized adaptive leadership as comprising three broad dimensions: (1) observing events and recording these events as "data," (2) interpreting the events and developing rival hypotheses, and (3) developing interventions in response to the adaptive challenge (s) created by the events observed (Australian Public Service Commission, http://www.apsc.gov.au/publications-and-media/current-publications/thinking-about-leadership-a-brief-history-of-leadership-thought/adaptive-leadership). Since adaptive change is not routine, it does not happen every day. On the contrary, it is episodic so the leader needs to observe the environment carefully and make an assessment that the challenges emanating from the environment call for action that is not routine. One example is the leadership challenges brought on by the deep, global recession of 2008. For Heifetz and his colleagues, challenges of this sort requires experimentation and improvisation – both adaptive responses that are likely to create discomfort for people in the organization because adaptive challenges break routine and force people out of their comfort zone. In managing adaptive challenges, Heifetz and his colleagues advise to get on the "balcony," a metaphor for observing and diagnosing in a new and uncertain environment.

The imagery of adaptive change is similar to other concepts in good currency such as an "inflection point," an intervention in a trend that can alter that trend a substantial way. The challenge is both to recognize that an inflection point has arrived and then respond to it. Similarly, concepts like "black swans" (Taleb 2007) and "unknown unknowns" (Rumsfeld 2011) also highlight the challenges that come from environmental surprises (Watkins and Bazerman 2003).

Adaptive challenges need not be catastrophic events such as the terrorist attack on September 11, 2001, in the City of New York. Nevertheless, it is not unreasonable to assume that low probability/high impact situations may occur while one is in a leadership position. A natural disaster is one possibility. Another one is a high profile corruption scandal that affects the agency or even the entire government. Low probability/high impact events create adaptive challenges for leaders. Since, by definition, they do not occur often it is difficult to build an effective repertoire to prepare for them; however, study and reflection is one way to simulate adaptive challenges.

## Conclusion

Building a leadership repertoire is not something that can be done quickly. It involves learning and practice, but also unlearning. A very senior retired military officer relayed the following story about the events just prior to the downing of a United States Marine helicopter in Mogadishu, Somalia, in 1993 that later became the grist for the movie *Blackhawk Down*. The general was in a meeting with the then Secretary of Defense and Deputy Secretary of Defense at the beginning of the Clinton Administration. The issue was whether United States Marines in Somalia should go after a prominent warlord in an effort to stem the de facto civil war in the country. The Secretary and Deputy Secretary were in favor of military action. The general advised against it noting that the element of surprise was lost. But, in his recounting of the meeting, the two were not listening. Years later he opined that he was so accustomed to giving advice but then following orders once a decision was made because this was embedded in his many years of training as military officer. But, in retrospect, he said that, having reached the highest level of the military, he should have exercised more independence and tried harder to convince the others of his position. To put it differently, he needed to adjust his repertoire; he had to unlearn.

A leadership repertoire need not be internally consistent. Consider the concepts of adaptive change and managing for performance. Recall that one piece of advice found in the writing of Heifetz and his colleagues is that leaders, in situations that require adaptive change, to stand away from the day-to-day activity – get on the balcony, a metaphor for careful observation that is unmarred by the technical challenges embedded in any organization. Yet, in government bureaucracies, leaders sometimes have to pay attention to detail. Let us return to the comedian. Why do some comedians vanish and others have staying power? One explanation is that the successful ones continually refine their repertoire while staying with the core properties of their repertoire that have proven to be successful over and over again. Ultimately, developing a leadership repertoire is an exercise in continual learning. While it may start in graduate school, it never stops. One's career in public organizations provides multiple opportunities to build a leadership repertoire through experience, sometimes failure, and reflection.

# Leadership and Consensus Building

Jacqueline Gilbert
Department of Management, Middle Tennessee State University, Murfreesboro, TN, USA

## Synonyms

Agreement; Collective decision-making; (Consensus) concurrence; Unanimity

## Definition

Consensus building is "a process of seeking unanimous agreement" (Susskind 1999, p. 6).

## Introduction

The road to consensus is a continuous, paved mosaic of managerial contribution. Achieving mutual understanding (along with shared governance) is a process by which possession of legitimate power may not necessarily translate to effective workplace outcomes (Wodak et al. 2011). A solely transactional focus misses the consideration essential to creating a "positive psychological atmosphere" ("Building Consensus" 2005, p. 14). The manner in which leaders approach conflict resolution (one divergent from "command and control") is a precursor to effective work relations. "Facilitative leaders" (Susskind 2009) or "unleaders" (Manz and Sims 1984) use tact, diplomacy, a willingness to hear all sides of an argument to solicit, understand, and integrate employee perspectives and to ". . . consult with the people s/he is leading to define the process by which the group will do its work or make decisions" (Susskind 2009, para 3). Facilitators make incremental, recursive, multiple attempts to clarify workers' positions. Their attention surpasses self-reflection as a superficial show of feigned managerial interest – instead, authentic leaders attempt to attain synergy through serial interview. Reinforcing the efficacy and esteem of participants in a change process solidifies workable solutions (Susskind 2009).

## How to Achieve Consensus

How does a leader, or someone who aspires to the "leader" designation, avoid the off-putting ailment of dean's disease (Bedeian 2002), in which managers surround themselves with those who mirror their opinions, sing their praises, and engage in rote regurgitation? Managerial lapdogs only serve to procreate a status quo. Conversely, Wodak et al. (2011) suggest that leaders' transformative toolkit includes a collection of strategies

intended to achieve consensus. Due to unequal hierarchical positioning, they argue that leaders and followers experience "interactional asymmetries" (p. 595), in that communication (if not mutually shared and maintained) may thus be top down, silently accepted, or acquiesced in order to avoid sanction by the receiving party. Sharing occurs when egoic desire for one-upmanship yields to objective data sharing and when leaders focus on the long-term prize of moving forward as a unit. Discursive bonding strategies (in which facilitators stress the use of "we" as opposed to "I" in linguistic patterns), along with the encouraging style – which solicits feedback via mechanisms of open questions, praise for participants input, inquires as opposed to inquisitions, and invitations rather than orders – create room for dialogue, disagreement, challenge to accepted norms, and a comfort level in the give-and-take self-expression that results when team members experience self-worth (Wodak et al. 2011).

Unleaders do not promote anarchy but rather teams composed of respective leaders (Peck 1987). People feel a part of the process when their opinions are solicited and when bosses abdicate managerial thrones to behave as egalitarian peer – and not organizational magistrate. If top management does not infuse organizational culture with expectations for respectful interaction (Gilbert et al. 2013), then bullying behaviors may fill the vacuum. "People-centered management" is evidenced in a relationship-building approach in which leaders exhibit vulnerability toward those they serve ("Burrelle's Information" 2001). Effective microlinguistic styles include paraphrasing (e.g., "It seems to me that," "Correct me if I'm wrong, but the crux of your argument appears to be. . ."). In the spirit of cooperation, employees are solicited not simply when a major change looms large but rather continually to ascertain possible adjustments.

Adjustment from authoritarian to democratic management style is impelled from (among other variables) (1) an influx of immigrants and diverse employee base requiring a range of relational styles; (2) a generational cohort (e.g., millennials) who responds more favorably to visual information presentation (Fenich et al. 2012); and (3) post career workers who value employer flexibility and part-time work. Town hall meetings (in which everyone is able to ask questions and express an opinion), focus groups, individual interviews, management by wandering around, surveys, and suggestion boxes are all ways leaders can place their finger on the organizational pulse. Uzzi and Dunlap (2012) suggest the following advice for turning a potentially contentious relationship to one of mutual allies, a process which they refer to as the "three Rs:" (1) Redirection of negativity so that circumstances appear the fault of a third party and/or focus on topics you have in common; (2) reciprocity, offering to give something of value away first as a way of proactively establishing goodwill; and (3) rationality, explaining the other party's relational value so that one's efforts are not perceived as managerial ploy. Leaders are distinguished by their ability to ascertain how they are being perceived by other people and correspondingly change course.

Supervisors descend down a slippery behavioral slope when they doggedly insist on their own unique viewpoints, promote platforms as dogma (not tentative solutions), and prefer diatribe as opposed to dialogue. Self-centeredness drives the quest for dominance (Belbin 2001) exhibited at work through "denial, blaming, and alibiing" (Branden 1998, p. 54). Rapport is created through exercise of emotional intelligence, with practices like getting to know one's employees as individuals – as opposed to mere units of production. Strictly transactional communication (in which employees are treated as a means to an end) breeds mistrust. Managers no longer do the technical job aspects themselves; instead, they are informational conduits who must (to be successful) take a holistic approach to their most-prized assets. Employee-centric managers realize that productive work is a confluence of personal factors, which include work/life balance, satisfaction with one's surroundings, supervisory support, and frequent checking to dissolve residual-lingering issues before they fester and metastasize into full-blown workplace problems. Ala the Dale Carnegie method, these managers are "hearty in. . .[their] approbation and lavish in. . .[their]

praise" (Carnegie 1937, p. 25). Workers in cooperative environments (Gilbert et al. 2012) have multiple opportunities to reward coworkers, like at Red Velvet Events – where fellow employees can award one another with a decorated "troll doll" for exemplary achievement (Straz 2015).

Conflict avoiders may purposely sideline issues for self-gain, or to circumvent necessary but potentially unpleasant encounters (Hensey 2000). But in a multicultural workplace, alternative interpretations of employee behavior abound. In one company, a team of engineers was frustrated because the lone female seemingly "refused" to participate. Delving further revealed that the engineer (an Asian female) felt compelled to roll words on her tongue several times before speaking – so as not to cause offense. Instead of a solution designed to "fix" the noncontributing party, she was allotted time to speak during meetings in a way that not only enabled her to fully contribute, but to provide teammates a reflective, engaged point of view (Sheridan 1994). The attainment of consensus mandates that leaders use continual, creative, welcoming methods to elicit employee input – so that even if decisions do not completely satisfy all parties, at least several alternatives will have been analyzed and vetted. Conversely, Moore and Woodrow (1999) suggest there are some situations in which consensus building may not be appropriate, e.g., (1) when a formal decision has been reached or a "de facto" resolution is in place; (2) the issue in question does not rise to the level of assembling a consensus-making process; (3) intransigence of some constituent parties exists; and (4) time constraints occur that preclude formal analysis tools – such as educating individuals in negotiation tactics, preparing a formal conflict assessment, and deliberation mediation.

Aggressive speech is the antithesis to cooperative behavior. "Throwing in the kitchen sink" (inclusion of superfluous information in an attempt to sidestep primary issues), interrupting, shouting, combative gesturing, posturing to solidify one's position, and gossiping are all ways to bulldoze and disrespect surrounding parties. Narcissists may be devoid of the emotional intelligence necessary to empathically view others' perspectives: "Egocentric, or 'narcissistic' managers can easily perpetuate a self-reinforcing pattern of behavior, one in which the conquered subordinate is transformed into an enabler, or an obsequious follower who willingly serves the boss" (Gilbert et al. 2012, p. 31). Gilbert et al. argue that behavior which is conniving, manipulative, sneaky, underhanded, and ruthless predominates in offices where narcissists hold powerful offices, and where they single-handedly control the fate of their subordinates. In the extreme, employees can feel like caged animals, slaves, individuals locked in a perpetual nightmare, water tortured, and persecuted souls (Tracy et al. 2006). Workers who have experienced mobbing, emotional abuse, and bullying not only have an altered worldview, but a penchant to keep their mouths shut for fear of negative repercussion.

Dysfunctional firms (e.g., those in which a lack of consensual employee give and take exists) are characterized by an inverted form of the (Rusbult et al. 1988) $2 \times 2$ framework – comprised of exit, voice, loyalty, and neglect. In terms of "voice," disagreement through honest self-expression in "dominated" culture is verboten, so (other than exiting a firm) as protest employees may employ clandestine, Internet-enabled methods to express their dissatisfaction (e.g., "Ratemyboss.com"). The conflation of individualism, combined with unchecked and unlimited power, works at cross purposes with empowering concepts of democratic management, freethinking, unfettered expression, and the collegial head butting that is necessary to ensure a mixture of ideas.

Some organizations employ "functional disruption" to engender employees providing opinions in a respectful fashion. Groupthink (along with intra- and intergroup conflict) is less likely to occur in firms where coworkers are encouraged to share with fellow employees. Methods to elicit conversation encompass focus groups, individual interview, Socratic method, Indian talking stick, debates, and intergroup conflict resolution exercises. The goal is to eliminate destructive stereotypes and replace them with sociotypes, or valid perceptions of teams/individuals (Gilbert 2001). Valuing diversity (in terms of extracting multiple viewpoints (Thomas and Ely 1996) is another way

to engender camaraderie at work. Multicultural organizations (Cox 1991) place value on inclusion, in which all workers feel part of the organizational fabric; members of a community in which managerial supportive culture nurtures bonds of trust among coworkers, open sharing, collegial friendship, and a penchant to develop peers. The modification of human resource functions (like performance appraisal) is necessary to ensure that career planning, recruitment that casts a wide net, compensation that is a function of annual statistical pay analysis, managerial accountability in terms of hiring/promoting/mentoring individuals different from oneself, inclusive education (e.g., training that eschews blaming other parties), and family-friendly policies which encourage work/life balance (Gilbert et al. 1999) occur in an effort to create consensus that reflects inclusion.

## Conclusion

Obtaining consensus may appear time-consuming and disheveled, somehow at odds with a streamlined, sanitized decision-making model in which conclusions are reached incrementally and with a minimum of dissent. The consensus-making process is more feasible when (1) managers must solicit more information (or try a new approach) due to inherent differences among employees; (2) parties involved don't possess the requisite information to make an effective decision as individuals; and (3) when cooperation, unity, and integration are prioritized as valued end products for implementation (Moore and Woodrow 1999). Managers can keep lines of communication open by actively soliciting opinions, learning cultural norms, devising novel solutions that capitalize on diversity, promoting civil dialogue, and through offering a systematic plan of continuous training designed to promote inter-employee understanding. A final product that represents a mosaic of individual thought results from a messy give-and-take process. Effort on the part of managers is necessary to evoke every employee's contributions and to circumvent groupthink.

## Leadership and Emergency Management

William L. Waugh
Georgia State University, Atlanta, GA, USA

Leadership is one of the core issues in emergency management. Leadership is all the more important during crisis situations (Boin et al. 2016) because the leader is more visible to the public and under pressure to perform effectively because lives and property may be at stake. Leadership is also more difficult in an environment in which authority is shared, resources are dispersed, expertise is scattered among other agencies and levels of government, and institutional capabilities are uneven. The first question that is asked during a disaster is "Who is in charge" and no one may be in charge.

Within some emergency management systems, symbolic leadership is also very important. The costs of failure can be dire for political leaders. The leader of the emergency management organization represents the political leaders. There are expectations that the head of government will make an appearance to demonstrate his or her concern for the safety of people at risk and support for the crisis management team's efforts. It must also be noted that involvement in crisis situations is only a small part of most emergency management leader's responsibilities. Much of his or her time is spent advocating for the program, assuring that the administrative structure that supports the program is functioning effectively, and preparing plans, conducting exercises, and performing other duties to assure that the jurisdiction is addressing risks and preparing for potential disasters. In general, the leadership of individual agencies and programs is a different issue than the management of emergency management functions and tasks. The common wisdom in emergency management is that programs should be located in the executive office of the president, governor, mayor, or other head of government so that its efforts will enjoy the visibility and political weight of that office. To be buried in an administrative department complicates communication with the executive when crises occur and can reduce the financial, material, and political resources that the program receives. That was the argument against moving the Federal Emergency Management Agency into the US Department of Homeland Security in 2003.

In the United States, the answer to the question "Who is in Charge" is complicated by the nature of the nation's political system and the complexity of its administrative system. The federal system is characterized by a division of power with authority divided between the federal and state governments. There is a division of power within states to the extent that the authority of local governments is defined in statute and/or constitution. State authorities, however, generally can preempt local action (Dillon's Rule) although it is seldom done and can be a messy political act. Nonetheless, looking at a chart of the government structure, one might assume that the federal government is in charge and there are circumstances in which that is true. Most disasters, however, are local, and local officials have principal

responsibility for the disaster response. A fire or flood is usually handled by local emergency responders, and the recovery process is handled by the local American Red Cross chapter or another local nongovernmental organization. As the scale of the disaster increases, more local governments and perhaps the state government or even multiple state governments become involved. Customarily, state officials defer to local officials as long as they have the resources to deal with the disaster.

In theory, that is how the larger American emergency management system operates. State officials assist local officials if needed, and federal or national officials assist state and local officials if needed. Leadership, in essence, is exercised by the lead government officials. Within each level of government, there are agencies responsible for dealing with hazards and disasters. Normally these are the lead agencies if a hazard exists or a disaster occurs, but there may be conflicts over jurisdiction. For example, in the US federal government, the agency responsible for dealing with hazardous material spills and accidents is the Environmental Protection Agency – unless the spill or accident occurs offshore or on a waterway in which case the US Coast Guard is the lead agency. Similar jurisdictional conflicts occur with other hazards and within other levels of government.

The first component of emergency management leadership is authority. The Emergency Management Accreditation Program Standard begins with the issue of legal authority. Does the agency have the legal authority to act when disaster strikes and does the emergency management program have a designated leader or lead administrator? At the local level, the lines of authority may or may not be easy to trace. Emergency management authority may reside with the Fire Department, the Police Department, the Public Works Department, a separate Emergency Management Office, or some other agency. Some communities do not have an emergency management office at all and depend upon their fire or police department or an outside agency. Moreover, local emergency managers may be part-time or unpaid volunteers. Notwithstanding the designation of a lead agency and a lead administrator, other agencies and personnel may be integral parts of the emergency management program.

In terms of disaster response, incident management systems have been designed to assure some unity of command. The Incident Command System (ICS) was developed in the early 1970s for fighting wildfires in California. ICS has become the most common incident management system in the United States, and it, or some variation, has been adopted in other nations. The structure includes the incident commander (leader), the staff personnel (e.g., public information, liaison, and safety officers), and the planning, operations, administration/finance, and logistics chiefs. As events get larger, a Unified Command (US) is set up in which there is collective decision-making with the emergency manager coordinating the process. A policy group exercises command. As events get even larger, a Multi-Agency Coordination System (MACS) is set up to accommodate the participation of more agencies. And, finally, the National Incident Management System (NIMS) was implemented by the US Department of Homeland Security, creating area commands and functional command organizations. A bureaucratic leadership structure was the result. ICS has served the fire service relatively well because it was designed to fit the disciplined approach to firefighting. Other agencies, such as the military and public health, have been somewhat less comfortable with ICS (Waugh 2009). It is a top-down command structure, but it should be flexible if circumstances require.

The national emergency management system is characterized by fragmented authority, dispersed resources, and dispersed expertise. Strictly linear lines of authority often do not fit. The emergency management system includes civilian public agencies (such as emergency management and regulatory agencies), military units, emergency responders (e.g., fire and emergency medical services), public health agencies, medical facilities/agencies, law enforcement agencies, nongovernmental organizations (large and small, faith-based and secular, local and national and international nongovernmental organizations), insurance and other private interests, contractors,

unaffiliated volunteers, and more. The diversity of the network itself suggests that command and control leadership will be less effective than collaborative leadership. Not all of the actors are subject to direction from central authorities. They can bring essential skills and other resources. Such a network tends to be an open system rather than a closed one – meaning that information will be shared with those outside of the network as well as within. Secrecy will be difficult. Decisions will have to be made with the participation of many agencies, if not all. Perhaps most importantly, there will be cultural differences that will complicate communication and collaborative operations. Some organizations are used to centralized decision-making, and others are used to more open and decentralized decision-making. Jargon, differences in information sharing, differences in accountability systems, differences over operations and missions, and so on will complicate joint operations. And, not all participants will understand ICS and/or NIMS. Some, in fact, may not accept efforts to build a central command system, and some may simply resist authority as a matter of principle (Waugh 2009).

Leadership became a major issue during the Hurricane Katrina disaster in 2005. Who was in charge? In many cases, local emergency management agencies were overwhelmed and desperately needing outside assistance. State agencies were also overwhelmed. Leadership was missing. Governors, mayors, and administrators were uncertain of their authority. Many National Guard units had been deployed to Iraq and Afghanistan. There were concerns within the emergency management professional community that too many decisions were being made by local, state, and federal officials with little or no knowledge or expertise in emergency management (Waugh 2006). As consequence, in 2006, Michael Selves, then president of the International Association of Emergency Managers, the major professional organization for local emergency managers, asked the Federal Emergency Management Agency to organize a working group to define the function of emergency managers. During the Katrina response, federal, state, and local officials; the media; and the general public clearly did not understand the role of emergency managers. Even emergency managers themselves were hard-pressed to describe their responsibilities. The working group represented the International Association of Emergency Managers, the National Emergency Management Association (mostly state emergency management professionals), the Emergency Management Accreditation Program (standard setting and accreditation body for state and local programs), the National Fire Protection Association's NFPA 1600 standard committee, the private sector, and the academe. The group agreed on the definition: "Emergency management is the managerial function charged with creating the framework within which communities reduce vulnerabilities and cope with disasters." It also identified eight core principles:

1. Comprehensive – emergency managers consider and take into account all hazards, all phases, all stakeholders, and all impacts relevant to disasters.
2. Progressive – emergency managers anticipate future disasters and take preventive and preparatory measures to build disaster-resistant and disaster-resilient communities.
3. Collaborative – emergency managers create and sustain broad and sincere relationships among individuals and organizations to encourage trust, advocate a team atmosphere, build consensus, and facilitate communication.
4. Integrated – emergency managers are responsible for ensuring to the highest possible degree of unity of effort among all levels of government and all elements of a community.
5. Coordinated – emergency managers organize all relevant stakeholders with a common purpose.
6. Flexible – emergency managers rely on creative and innovative approaches to solving disaster challenges. This is especially the case after disasters when predefined approaches may be inadequate to the situation at hand.
7. Professional – emergency managers value a science- and knowledge-based approach based on education, training, experience,

ethical practice, public stewardship, and continuous improvement.

8. Risk driven – emergency managers utilize sound risk management principles: hazard identification, risk analysis, and impact analysis. Priorities and resources are assigned on the basis of this process (Selves et al. 2007).

With the eight principles, a core skill set for emergency managers began to take shape. Value was placed on emergency management education and training, as well as experience. Value was also placed on management expertise. Emergency managers are not generally emergency responders. They manage human, financial, and material resources, as well as maintain the emergency management program and coordinate with those who are responsible for managing hazards and/or dealing with disasters. As an emergency management expert, Lucien Canton (2007) put it, they are responsible for the decisions concerning when and where emergency shelters should be opened and closed, but not for the actual operation of the shelters. There are community organizations with mass sheltering experience and expertise that can better fulfill that need. Much the same can be said of mass feeding and medical services. Copies of the principles are displayed in FEMA training facilities. The principles are subject to review and revision by the professional community that developed them.

From the eight principles that reflect the functions of emergency managers, one can glean skills that would be expected of emergency management leaders. A broad perspective, view to the future, attention to the science of disasters and human behavior, flexibility, collaboration, and attention to measured risk when decisions are made are centeral to the emergency management culture. The need to address the risks associated with climate change is a case in point.

The leadership literature suggests a variety of traits, styles, and contingency-based factors that may affect leadership approaches. Denhardt et al. (2009) have argued that we have moved on from traits and styles to strategies of leadership. The choice of leadership approach depends upon the context and the goals. Transformational leadership was an idea born in studies of government and political leaders. There is a clear example in emergency management. When James Lee Witt became FEMA administrator in 1993, he stood at the door of the FEMA headquarters in Washington, D.C., and shook hands with employees as they came to work. FEMA had been castigated during the responses to Hurricanes Hugo in 1989, Andrew in 1992, and Iniki in 1992, and congress had considered dismantling the agency and sending its constituent programs back whence they had come. Witt transformed the culture of the agency and reorganized around the all-hazard model (Waugh and Streib 2006). Quite literally, the 1990s is frequently called the "Golden Age of FEMA" because of those changes. Witt was a transformational leader, but that is not the only leadership approach that might work in an agency like FEMA. The administrative context and the politics required fundamental change in the organization to assure effective action and accountability.

In many respects, FEMA administrator Craig Fugate has been a transformational leader. With the Federal Emergency Management Agency's adoption of the Whole Community approach, the role of the emergency manager became more comprehensive. Citizen engagement became much more critical. The Whole Community approach asks emergency managers to:

- Understand community complexity
- Recognize community capabilities and needs
- Foster relationships with community leaders
- Build and maintain partnerships
- Empower local action
- Leverage and strengthen social infrastructure, networks, and assets
- Enable the public to lead, not follow, in identifying priorities, organizing support, implementing programs, and evaluating outcomes. Empower them to draw on their full potential in developing collective actions and solutions

According to Fugate, with the Whole Community approach, "Government can and will continue to serve disaster survivors. However, we

fully recognize that a government-centric approach to disaster management will not be enough to meet the challenges posed by a catastrophic incident. That is why we must fully engage our entire societal capacity..." (FEMA 2011: 2). "The benefits of Whole Community include a more informed, shared understanding of community risks, needs, and capabilities; an increase in resources through the empowerment of community members; and, in the end, more resilient communities. A more sophisticated understanding of a community's needs and capabilities also leads to a more efficient use of existing resources regardless of the size of the incident or community constraints" (pp. 2–3). In some measure, the new approach was in response to the threat of pandemic. The nation was preparing for catastrophic disasters in which communities can expect that they will have to take care of themselves for an extended period of time without assistance from outside agencies. It was also due to the recognition that the "first responders" to a disaster are often family, friends, and neighbors of those affected. They are the first search and rescue team and they may be the first to provide medical assistance. They provide food and shelter. The policy change, too, was in recognition that every community is different and a one-size-fits-all approach might not be effective in all cases. Some people and some communities need more assistance than others in disasters, and they may need specific kinds of assistance that few others need. The challenge for local emergency managers, then, is to understand the needs, vulnerabilities, strengths, values, norms, institutional structure, networks, and priorities of their residents. Reducing social vulnerability will increase resilience. Recognizing poverty, for example, reduces the community's ability to respond to and recover from major disasters. Public health officials were surprised during the Katrina disaster when the largest medical needs were for treatment of chronic diseases, such as heart disease and diabetes, rather than broken limbs and other physical injuries. Also, improving community resilience has become a focus of emergency management programs. In a small town, the loss of a single business or several businesses can severely damage the local economy. Local economies are often very fragile.

As a consequence of the reinvention of emergency management, particularly community-level emergency management, the role of the emergency manager has expanded. In 1987, Thomas Drabek concluded in *The Professional Emergency Manager* that interpersonal skills were most important for emergency managers to be effective. *The Principles of Emergency Management* called for collaborative skills, as well as management and communication skills to deal with the networks involved in the broader program. The Whole Community approach put even greater weight on communication and collaborative skills. Working with multiple networks of individuals and organizations also requires political and social skills. And coordinating the efforts of multiple networks requires good management skills. The emergency manager needs broad knowledge of emergency management functions, but people skills lie at the core. Technical specialists can be found in emergency response agencies, colleges and universities, hospitals, and other organizations.

Leadership in emergency management has to be collaborative. There has to be information sharing for all to have the same sense of direction. There has to be common purpose if the emergency management program is to adapt and improvise when situations require. There has to be awareness of the political, social, economic, and cultural context of emergency management in choosing courses of action. A lack of understanding of how governments operate has been common among emergency management and Homeland Security officials. During the Katrina response in 2005, for example, responders from outside of the South or the particular state to which they were deployed did not understand local custom or local laws. In many respects, every state is different in terms of the authority of local governments, and, even within a state, local authority may vary considerably based upon the size of the jurisdiction, the form of government, or even the quirks of state and/or local politics. In some communities, the highest local official is the probate judge even though he or she does not have administrative influence over the government. County sheriffs, judges, mayors, city

and county managers, and other institutions may share authority over emergency management functions. The role of emergency manager may be quite ambiguous in other words.

Leadership has to rest on relationships. Trust is the necessary ingredient in making cooperation and collaboration work. One of the commonly cited rules in emergency management has been that it is far easier to work with people that one has worked with before. Familiarity facilitates communication and trust. Disaster exercises, as well as disasters themselves, provide opportunity to meet essential personnel who may also work together in the future. Putting faces to names makes it easier to share information and other resources. It is also easier to trust someone that has already demonstrated their trustworthiness.

Lastly, leadership requires an ethical foundation (Kapucu and Ozerdem 2013). Ethical lapses undermine trust and, therefore, undermine leadership. Discrimination against minorities, for example, affected local disaster responses in Louisiana during the Katrina disaster. The IAEM Code of Ethics requires emergency management professionals to be attentive to the ethical implications of their actions. Social equity, equal treatment of all residents without regard to race, gender, age, religion, or sexual orientation, is an American value and a value that has to be preserved in American emergency management (Saban 2014).

## Synonyms

Humor; Irony; Leadership; Power

## Definition

**Irony** is a rhetorical technique or situation that is strange or funny because things happen in a way that seems to differ radically from what somebody expected.
**Humor** is a funny or amusing quality of people, things, pictures, words, or situations.
**Leadership** is the ability to lead other people or to have power on them.
**Power** is the ability to control people or things.

## Introduction

Mockery of the political reality gives people a certain sense of freedom and revenge against the

political elites. Historically, political jokes and caricatures go hand and hand with the political leadership. Humor somehow places authorities in absurd situations portrayed in a negative light, distorting the external features and speech deficiencies. In the age of digital media, we have much more of this humor power, comparing to previous times, and people actively use it.

Digital media provide more comfortable styles of information perception. People experience mobile information "on the go" as more relevant to their daily lives than mainstream news (Voltmer and Brants 2011). The blogosphere has become the second (and sometimes first) home to humorists and cartoonists; social networks are full of ironic motivational posters (demotivators) and ironic vernacular images covering various forms of political life. Today, all of them are the special way of reaction to these or other government's actions, statements of political leaders, and the current political changes. They are the result of the emotional evaluation of events, which is expressed as a visual allegory of irony, which has hidden meaning, understandable to active users of digital media. Objects of irony and its forms and expressions combine the several cognitive layers of meaning, as well as carry a strong emotional and social burden.

Political irony and humor display, among other, the "emotional turn" (Gould 2009) in the study of social and political processes that take place in recent times. Understanding political emotions as a motivational force (Staiger et al. 2010) posits irony and humor as ubiquitous features of social life. When people provide, accept, and understand humor, they recreate themselves by developing connections in the flows of political, economic, and cultural information. Irony contributes to the process of creating a political sense on cognitive and emotional levels (Hutcheon 1994).

Irony and humor themselves are strong political emotions, because they are always a conflict, the breaking of reality into several simultaneous worlds that contradict each other. They represent "emotional absurdity" (Veatch 1998) and imply that the subject (1) perceives what is happening as a disruption of a subjective moral principle – the vision of what a situation should be – and (2) simultaneously perceives it as normal. The essence of political humor is to emotionally express contradictions between "they, the authority," and "we, the people," and probably to reveal the absurdity of situation. It is based upon bewilderment and surprise and does not always evoke laughter, but sadness, grief, irritability, and other emotions (Sanina 2017).

Additionally, irony and humor constitute a powerful mechanism of social unification. The utilization of the latter implies the existence of some common experience and, therefore, as a final result, self-identification with the group, society, and state (Sanina 2014). Different people and various cultures have diverse principles that influence how humor is perceived. Veatch states that for a group to perceive something as funny, its members should possess similar subjective moral principles and that these exact principles define what makes a particular person laugh and what does not: it is unlikely that a feminist will laugh at anecdotes about blondes or that a person of African-American descent will find racist jokes humorous (Veatch 1998). People only laugh at what does not contradict their deep moral beliefs. When people laugh at jokes, they recreate themselves by developing connections in the flows of political, economic, and cultural information.

## Humor as an Object for Analysis

According to postmodern positions, the whole world appears in front of each person as a web of signs that act, resonate, and mutually suppress each other. The whole reality represents some text that whimsically intertwines itself with diverse linguistic, stylistic, psychological, and social prerequisites. Therefore, these days, the interpretation of every text is performed according to a special communication model with the particular feature that is being partially or fully applied to a system of communicating the humor. The essence of ironic discourse is that the true sense of the message is unnoticed, incomprehensible, or misinterpreted. According to Wilson and Sperber's (Wilson and Sperber 2012) echoic mention theory

of irony, the rhetoric of irony should be explored according to a basic interpretation mechanism that remains unchanged despite cultural differences. Thus, irony is viewed as a result of metalinguistic activity: the speaker refers to something that was said by someone before (that is where the echo metaphor comes from) and at the same time expresses his or her personal attitude towards what is said. Irony is a way to distance oneself from the cited point of view in order to laugh at it and to prove its inconsistency.

All of this presents a major problem for interpretation in the research sense of comprehending the vast quantity of hidden meanings that are characteristic of the modern sociocultural environment. In this case, the research methodology of "discursive interpretation" (Shtompka 2007) became one of the most important tools to understand the relations between leadership and humor. The notion of discourse emphasizes that the analysis is not only signs and rules that give certain meanings to the jokes. It also affects the social and individual contexts where these rules are used. In other words, the ultimate goal of the analysis we are interested in is what sense is put by producers and consumers of humor and irony into their actions.

## Leadership and Humor in Russia: A Case Study of "Potsreotizm" Livejournal Community

One of the most important spaces of the humorous representations of the political leaderships in Russia is the Internet communities and groups. Among them, the oldest one is the "Potsreotizm" Livejournal community (http://potsreotizm.livejournal.com). Internet community was chosen as a particular object that itself represents a space for developing a civil identity. This Internet journal was founded on June 22, 2006.

The name of the community is humorous itself. In different languages (Russian, English, Ukrainian, Idish), this word is attributed to lexemes considered to be obscene. Nevertheless, it is widely utilized in literature (Sergey Dovlatov, Stewen King, Max Frei) in both the pejorative and ironic senses. With the spread of the Internet, the word "Pots" became used in network slang and is often inserted into other words, thus altering their spellings (e.g., «Patient» to «Potsient», «Pochemu» (rus.) to «Potsemu») and adding various other connotations to the words.

The word "potsreotizm" itself is a contextual synonym for so-called kvass patriotism (another version is "hurray-patriotism"), which was supposedly introduced into the language by the Russian poet Count Pyotr Vyazemsky in order to denote the people who purposefully showed off their "Russianness" and dressed themselves in what they believed were traditional Russian costumes but in which they were often mistaken for Persians. "Kvass patriotism" is a falsely interpreted love for motherland when everything that is native is being glorified simply because it is native and everything foreign is being denied for being foreign. Potsreotizm is patriotism taken to absurd levels. This is the context that community attributes to this word. "Potsreotizm" is a virtual union of people whose goal is to critically represent material and symbolic objects, situations, and actions that according to them destroy the moral and political principles of the citizens and also both the rational and sensual expressions of love for the motherland, the pride in the achievements and culture of one's own country, the desire to identify oneself with that country, and the aspiration to defend its interests. The main goal of the "Potsreotizm" community is to disrupt the existing notions of the beliefs and rules of conduct that are associated with the actions, goals, and ambitions of the political leaders and authorities. In this disruptive community, members use humor as a weapon against the political leaders (Sanina 2012).

In the Potsreotizm virtual community, two types of humor are used. The first type is based upon creolized text and includes an illustration in which the words are incorporated into the picture. The conflict necessary for the irony – the break with reality – is here based on the word play and its visual surroundings. Meaning and illustration comprise two possible but conflicting types of reality. The ironic contrast is connected with the ideological level of perception and concerns

worldview, the system of conventional norms, and the rules of conduct. The second type is a "silent irony" wherein the effect of reality's conflict is based exclusively upon the illustrations, without using text.

The main difficulty with wordless irony lies in the need for worldview explication. This mechanism includes a transformation of expectations, a revision of the system of regulations and, based upon this, an emotional reaction (disapproval, laughter, criticism). In the case of visual irony, we deal not only with an illustration but with the individual and group consciousness that shapes it. At the same time, the community members discussing the photograph understand the situational inconsistency as well as what the author of the post intended when he published the picture.

## Objects of the Humor

The objects of humor are various and consist of different elements (Sanina 2012). Nevertheless, active (or taking action) and passive (upon which action is being taken) objects can be identified. Active objects can, in turn, be divided into individuals (exact images of widely recognized personalities), a separate "we" (depictions of common citizens), and groups (individuals as representatives of a certain social group).

The leaders of each individual's group, as can be justifiably expected, are the president and the premier minister of Russia, Vladimir Putin and Dmitry Medvedev. Generally, their depiction and emotional evaluation are based on the silent irony that considerably intensifies the meaning of the representation. The contexts of the representations are mostly general and include everyday events: Medvedev can be witnessed on a train, looking through a microscope on a visit to a research institute, looking through the gun sight of a grenade launcher, and painting a children's toy in a recreation center for kids. Putin can be witnessed at a young player's hockey session, in a gym, and singing a song by a fire with the construction workers for the Sochi Olympics. The effect of irony is built on comparing and confronting the public and private spheres and can be conveyed through a popular and famous Russian saying: "This is not my Czar's business. . .." Every unofficial interaction of the country's leaders with common people is mainly perceived as condescension or "not their business," and exactly this fact provokes irony and humor.

The second place is occupied by the patriarch of Russia and ordinary priests. The major interest in the ironic depiction of this group stems from the intensification of "official orthodox discourse" and from church participation in the political matters of the country. Despite the results of polls stating that the number of respondents voting for the return of religious studies to schools has slightly increased (from 47 % in 2001 to 54 % in 2016), discussions about the strengthening of the social and political influence of the Orthodox Church in Russia take place frequently.

The validity of the religious feelings of the Russian people, both common citizens and political leaders, is often questioned and becomes a reason for irony for "Potsreotizm" community members. On the one hand, such rapid growth in the number of religious believers after living for 70 years in an atheistic country can be understood in the context of the search for identity. On the other hand, such a swift move to "religiosity" raises the question of the depth of religious feelings and emotions that are mostly considered to be of a private and intimate nature. Therefore, each public demonstration and mass proclaiming of religiosity also becomes an object of irony for community members.

The objects of passive irony typically comprise symbolic, material-symbolic, material, and institutional elements. To the symbolic elements, the following components can be attributed: the words "Russia" and "Russian," the Russian national emblem and hymn, the flag of the Russian Federation, specific signs that possess patriotic meaning (in the first case, those connected with World War II), imperial and Soviet symbols (including Lenin and Stalin), attributes of state festivities, and studies of patriotism. To the material-symbolic objects of irony, the following components can be attributed: roads (highways), a long-time Russian problem, the VAZ car factory,

the Russian Skolkovo Innovation Center, and vodka as a "traditional Russian drink." To material objects, the following elements can be attributed: the personal possessions of the political elite (houses, country houses, and yachts) as well as decorating these objects or other personal belongings in traditional Russian styles.

Institutional objects are represented by state structures, political and social organizations, and institutions (elections, army, church, political parties). One of the leading parties to be visually depicted is "United Russia"; the runner-up is the Communist Party of the Russian Federation. Representing institutional objects is one of the main examples of how the current situation in the country is perceived by the members of the community. It becomes highly significant when political changes are taking place, e.g., during election campaigns and elections themselves. One of the final reasons for the active discussion of this topic among community members was the elections in the State Duma on December 4, 2011, which provoked mass protests among the Russian population with the slogan, "We are for honest elections!" (Volkov 2012).

## The Role of Humor in the Processes of the Leader's Image Construction and Civic Identity Formation

Virtual community members, as Internet users, are often influenced by global values that in turn develop in them an outlook of the world upon which they build the ironic effect of the images represented. Mutually understood meanings indicate that we address a specific societal unit for which civil identity does not necessarily mean extreme loyalty and patriotism as demanded by official government discourse.

This weblog community members' image of the political leaders is defined by clear, although not always verbalized, statements that can be conveniently formulated in the following way:

- State public figures should not perform outside tasks as their duties because (1) their public role means that closer attention is being paid to them, (2) their "state" status by default means that they have a great number of administrative tasks and therefore should be completely occupied, and (3) the "showing off" demonstrated by state figures diminishes the real effectiveness of state administration.
- The religious world should be separate from the secular, and the church should be detached from state administration. Religion is associated with worldview and the search for self; politics and state administration are connected with activity, specifically, professional activity. Thus, demonstrating unity is nothing more than showing off, which leads to pseudo-religiousness and pseudo-statehood.
- State symbols, including depictions of political leaders (their clothes, diaries, interior decorations, etc.) in everyday or private contexts, should not be used.
- Patriotism, including the process of patriotic education, should not be overly enthusiastic and performative: feelings about the "state" are private and should not be shown off.

The informatization of society, the intensification of communication processes, the spread of the Internet, and the establishment of postmodern culture have led not only to new social phenomena and processes but also to a new type of group outlook, a new perception, and a new vision of the world that can be characterized as ironic (Behler 1990). Today, irony is transformed into a general model according to which the construction and internalization of various social, cultural, political, and economic phenomena are taking place. This fact allows for claims of the emergence of a new, modeling sociocultural function of irony that was not specific to this particular instrument of communication in previous historical periods. This idea is conveyed by a major increase in the role of irony as a stylistic figure and a speech formula in literature, mass media, advertising, and everyday discourse. Humor is used by mass media and especially by the new media in a similar way that carries out "laughter control" on a macro level, for example, criticizing not the top members of the political elite but the elite itself; the satire makes the subject ideologically more

neutral. This particular form of "laughing out" creates an illusion that bureaucratic structures adhere to criticism and therefore appear to be developing and taking into account individual opinion – in this way, society's integrity is sustained.

Although irony and humor, which reflects the attitude of a certain group of Russians to power, does not pretend to the sudden destruction of the social order as the real protests, it is a combination of signals of necessity of social-political changes. Digital media provide new, safe opportunities for political participation and interaction (Akdeniz 2002), and people use them as new ways of communication and communication with like-minded persons. Humor is a reduced form of political expression of emotions that people prefer in a situation of disunity and disintegration of society. Routine, prevailing over an eventfulness of images with ironic character, indicates that the focus of ironists is above all the difference in the perception of the current political situation, "we, the people who understand visual political irony," and "they, the people who watch official TV channels," and is loyal to the existing political leaders and authorities.

In this sense, irony and humor can provide an idea of the nonlinear, rhizome characteristics of a modern culture that lacks distinct borders. Their daily usage leads to what were traditionally considered exclusive categories (power, sexuality, and death) now playing the roles of cultural categories that heuristically describe modern social situations. Irony and humor unite diverse elements into a dynamic, conceptual unity, thus opening the way for interpretation ambiguity. They act as the basis for the dynamic association of various elements of modern culture, which suggests the dynamic demonstration of their roles in reflecting the discourse of modern culture and modern social action.

Creativity; Improvement; Initiative; Problem solving

## Definition

Public sector innovation introduces new and improved approaches to the delivery of public goods and services, through capacity development that often incorporates new technologies, and through information sharing that widens the

range of possibilities open to public organizations in responding to the needs and expectations of the public whom they serve. Among the challenges to leading public sector innovation is that it involves trial and error, and at the onset, there is uncertainty about the actual outcomes. This can obstruct the availability of support and cooperation that would be necessary for its success. Leadership is a crucial factor that can determine what support and cooperation public sector innovation receives.

Leaders in the political arena and at different levels of authority in public organizations have varying degrees of influence over whether innovation is to be an option pursued by a public organization: what outcomes will be projected, and what financial and other resources will be available for accomplishing them. There are numerous leadership styles and their effectiveness may vary in different situations and environments. Given the increasing need for innovation in a changing global environment, to lead public sector innovation effectively, public representatives and officials require knowledge about different leadership styles and about when the application of a particular approach is appropriate.

## Introduction

In the twenty-first century, there has been a significant amount of innovation in the public sector, documented to a large extent by innovation awards programs in different parts of the world. There are dozens public sector innovation awards being presented, primarily at the national level. There are also regional and international awards programs. Altogether, these programs evaluate hundreds of nominations annually, disseminate publications that list cases as good practices, and maintain databases on award winning innovations as reference points for the public administration field. Indeed, innovation awards programs are valuable for their role in information building and sharing, but moreover, for providing incentives and catalysts for continuous innovation in the field.

Awards programs foster problem-solving innovations by inviting nominations in categories where public sector deficiencies are evident. Award winning innovations most often demonstrate that they have positively affected the quality of life for individuals and communities, with the potential for replication in similar environments. When crafting governments' agenda, political leaders take note of public problems, identify where the need exists for innovation, and influence the founding of consensus to justify mandates for public organizations to address them. Elected political leaders can, legitimately, define desired outcomes and allocate resources for pursuing certain innovations.

Many innovation award recipients emphasize the importance of political leadership at the highest level. When actively involved, high-ranking political leaders import the clarity and decisiveness needed for building momentum toward advancing innovations in public organizations. Winning innovation awards provides political leaders with opportunities to showcase their successes. They are then better able to validate expenditures for other innovative policy designs. Such success promotes positive reviews of the responsible public organizations, celebrates the diligence and expertise of employees, and enriches their work experiences and job satisfaction, ultimately contributing to building the foundations for innovation as part of their organizational culture.

At the organizational level, department heads can be instrumental in facilitating innovation. Their in-depth understanding of operational aspects of an organization empowers them to direct expertise and applicable skills to pioneer and fulfill innovation projects. Furthermore, at another level in the organization, frontline supervisors can lead the integral aspects of innovative endeavors, such as at the point of contact with the public service recipients. Their observations and feedback on lessons learned are often fundamental to the degree of responsiveness that can be accomplished, and the overall outcomes of an innovation.

## Challenges to Leading Innovation in Public Organizations

There are many challenges to innovation in the public sector that render effective political and

organizational leadership essential criteria at every level. Added to the challenge of obtaining adequate support and cooperation to pursue innovations is the increase in public demand for goods and services, building employee trust, and keeping abreast of new technologies. The continuing trend in the movement of populations from rural to urban areas, in order to access public goods and services, creates the challenge for public organizations to achieve adequate capacities through which to deliver those goods and services. In many parts of the world, political leaders must address the uncertainties before them about whether they can meet the demands of increasing numbers of new residents, with limited financial and other types of resources, demands for education and health care, predominantly.

Public organizations achieve efficiency by standardizing processes. Training requirements evolve around achieving efficiency and this lead to specialization within a work force. Specialization supports confidence building among employees, therefore, leaders within organizations face challenges of resistance toward innovation from employees who are being asked to undertake new roles and unpracticed tasks. Many studies show that major obstacles to innovation come from within related organizations, based on employees' resistance, set against the time needed to introduce and perfect the use of new methods that incorporate new technologies. Successful leaders, while upholding organizational goals, must inspire and accommodate these changes within their workforce. Earning employees' trust, by transferring focus to the important goals and objectives of the innovation, can motivate the honing of new technological efficiencies among public employees.

A major innovation to receive support from political and organizational leaders, in addressing the challenges outlined here, is the development of eGovernment (governing processes through electronic Internet-based technologies). eGovernment is designed to be cost-effective in disseminating up-to-date public information, in improving connectivity and engagement between the public and their elected and appointed officials, and in facilitating online transactions that reduce the client flow through public organizations experiencing capacity limitations, for example, with equipment, space, and staff. At the same time, however, modern technologies continue to create the demand for innovations (Borins 2002) in order to maximize their potential to continue to improve and expand the delivery of public goods and services. Indeed, those technologies impose new learning and training requirements within organizations, and across the citizenry.

## Leading Public Sector Innovation Effectively

Effective leadership for public sector innovation succeeds in creating environments that are conducive to innovation (Wipulanusat et al. 2017), with adequate support and cooperation to pursue it as an iterative process. Ideally, disposition toward innovation should be integral to the organization's culture. Other essential factors that strengthen the relationship between leadership and innovation are the leader's ability to mobilize resources, their commitment to accomplishing the goals of the innovation, and good communication and decision-making skills (Lykke et al. 2017).

Being able to mobilize resources is a critical skill for leading innovation that is useful for both political and organizational leaders. The political leader can provide funding, whereas leaders within organizations can make good use of funding based on their understanding of avoiding waste and achieving efficiency. Leading innovation efficiently within the organization also builds on good management of the human resources. Understanding public sector motivation is important to ensure that employees remain highly motivated. This occurs when they identify with the mission of the organization and are committed to its achievement. From a practical perspective, appropriate remuneration is also a key factor in sustaining employee motivation. Leaders need to demonstrate consideration for their subordinates' needs and ensure that they have funds in place in order to keep them compensated.

The leader's commitment to the innovation process is also essential for successful innovation.

Political leaders are normally committed to achieving the outcomes, when they are the ones initiating the innovation. Their desire is to see the goals accomplished. When innovations are initiated at the organization level, leaders within the organization are similarly committed. Mutual support and cooperation are important between political and organizational leaders in this regard, since the two types of leadership are reciprocal. Lack of cooperation between them can provide obstacles to making adequate resources available during the innovation processes. At the organization level, innovation can also be initiated within the boundaries of bureaucratic discretion, in that leaders within the organization can create innovative ways to use available resources without needing political cooperation. But, cooperation with other employees in the organization is equally essential.

Political leaders need good communication skills. They must clearly communicate the goals of a proposed innovation to gain agreement over its importance and to justify public funding. To achieve this result, they must present a long-term vision, pertaining to how the innovation will affect the public good. Organizational leaders also need good communication skills to inspire cooperation and collaboration with the related workforce: to inspire their commitment to the organizational goals, and to engage with them to make good use of their feedback in forging forward with the innovation.

A leader who is a good decision-maker can succeed with introducing and implementing innovations. In this context, a good decision-maker gathers and processes information, and evaluates it as it relates to achieving the goals and objectives of the innovation. Such decision-making activities should incorporate stakeholders' inputs and recommendations, with the decision-maker being open to new ideas about the issue. Mindful that ideas about which decisions are most appropriate vary, an effective decision-maker can seek information based on the skills and expertise of the stakeholders. Political stakeholders typically expect a rational approach, in terms of maximizing output, while minimizing input, taking into consideration social and economic aspects, respectively. In contrast, organizational leaders routinely view the process through the lens of the organization, in terms of maximizing the application of available expertise and minimizing the need for restructuring and retraining.

A multiplicity of leadership skills enable successful innovation and they do not fit neatly into one leadership style, although those that demonstrate value for organizational goals and consideration for subordinates are recognized as particularly appropriate for effectively leading public sector innovation. "*Transformational leadership*" is most often prescribed for succeeding with innovation. Transformational leadership (Bass 1985) is a collaborative process between leaders and their subordinates aimed to identify the need for change, devise a vision of what the change might be, and develop a course of action for achieving it. Transformational leaders work well with their subordinates, encouraging them to look beyond self-interests toward achieving the common good. According to Burns (1978), transformational leadership develops when leaders possess great capabilities that their subordinates recognize, when they have the ability to inspire and motivate others, when they genuinely exhibit consideration for their followers, while at the same time challenging them to continuously improve their performance.

## Leadership Styles that Are Ineffective for Innovation

Achieving innovation requires cooperation and promoting a shared vision. Classical leadership styles are ineffective in this regard because they tend to be autocratic, with the manager retaining as much power and authority as possible in the decision-making processes. When staff are expected to obey orders, without explanation, and without the opportunity to provide input, their role can become mechanical. Although clear instructions are useful during innovation processes, delegation alone is inadequate. It does not support conditions for the feedback and exchange of ideas that are essential to facilitating incremental modifications. In addition, autocratic leaders employ threats and punishment to manage employees'

performance. This is inappropriate because it diminishes the benefits of learning experiences that may be derived from miscalculations that might occur throughout innovation processes.

Managers leading innovation should also beware of laissez-faire style leadership. In that style of leadership little guidance is provided. Employees have the freedom to set goals, make decisions, and solve problems on their own. Laissez-faire leadership might work well in situations where employees are well trained for the tasks, experienced, and confident, but not when there is inexperience in developmental processes and possibilities for revealing incompetence. During innovation, participants need regular interaction, feedback, and encouragement in their relationship with the leader. Staff can have unique and informative perspectives that provide greater insight, making these interactions likewise beneficial to leaders. Laissez-faire leaders are seen to be withholding leadership and the much needed interaction with employees that must be central to their role in leading innovation.

## Conclusions

Successful public sector innovation benefits from high-level political leadership and leadership from appointed administrators working within government departments and agencies. To a great extent, these leaders' effectiveness depends on their ability to create environments that are conducive to innovation. To create such environments, both types of leaders must mobilize financial and other resources, demonstrate commitment to the goals of related public organizations and to achieving the desired outcomes of the innovation, in the public's interest. They can cooperate to complement each other's inputs and collaborate with the workforce to maximize desired outcomes. Possessing good communication skills will aid them in achieving clarity regarding the innovation process and serve to inspire and motivate their followers. Decision-makers also need to be collaborative and open to ideas from others who are involved. Advocates for leading public sector innovation recognize transformational leadership as the most appropriate leadership style, and they advise against those that are autocratic or laissez-faire.

# Leadership and Public Employee Trust

Hugo D. Asencio and Rui Sun
Department of Public Administration, California State University, Dominguez Hills, Carson, CA, USA

## Synonyms

Administrative leadership; Federal agencies; Government organizations; Subordinate trust; Transactional leadership; Transformational leadership

## Definitions

Leadership is getting people to do what they otherwise would not do through transactional and transformational behaviors. Employee trust in

leaders is the faith employees have in leaders' intentions and the confidence they have in leaders' actions.

## Introduction

Leaders play a key role in building and sustaining trust. They earn trust when they honor their agreements; behave consistently; invest in their followers by giving feedback and providing them with opportunities to acquire new skills; involve employees in decision-making; maintain open channels of communication; and hold people accountable.

Trust is crucial for the long-term stability of organizations. On one hand, employees who trust their leaders are more comfortable sharing sensitive information or admitting mistakes. They also tend to reciprocate for trusted leaders by working hard on required tasks and performing beyond basic expectations. Further, employees who trust their leaders are more likely to accept those leaders' actions. On the other hand, employees who mistrust their leaders often seek ways to avoid vulnerable situations, which, in turn, can affect their overall performance. Employee distrust of leaders also increases transaction costs within organizations (Cho and Poister 2013).

Given the significance of trust in organizations, scholars have investigated the determinants of interpersonal trust in public organizations. Some of the factors that have been studied include career development, communication, empowerment, feedback, job security, managerial fairness, performance appraisal, organizational support, participation in decision-making, public service reform, public service motivation, procedural justice, and strategic planning. Nevertheless, the relationship between leadership and interpersonal trust in public organizations remains understudied. A few studies (e.g., Asencio and Mujkic 2016) have examined the impact of different leadership approaches on employee trust within public organizations. However, since these studies are cross-sectional, they only capture leadership and employee trust at a certain time and do not account for any changes that may happen in the organization over time.

Public administration studies tend to investigate management strategies at one point and have largely overlooked the endogeneity problem of leadership. Thus, the causal inferences derived from them are less accurate. Cross-sectional studies cannot examine the dynamic relationship between leadership and employee trust that may change over time, so they either underestimate or overestimate the perceived effects of leadership (Oberfield 2014). Further, leadership and trust may be simultaneously correlated to each other; that is, leaders' behaviors may affect the level of employee trust in them, and the level of employee trust may cause leaders to change the way they lead. In addition, employee trust in leaders may influence how employees perceive the behaviors of their leaders. That is, employees who trust their leaders may perceive leaders' behaviors differently than those who have no trust in their leaders.

## Leadership in Public Organizations

Transactional and transformational leadership are two of the most well-known approaches to leadership. Transformational leadership emerged in 1978 with the publication of James MacGregor Burns' classic work titled *Leadership*. Burns distinguished between transactional and transformational leadership and argued that leaders were either transactional or transformational, but not both. Later, Bernard Bass extended Burns' work, arguing that leaders could switch between the two approaches depending on the situation. Although Bass believed that possessing both types of leadership would help achieve the best results, he considered transactional leadership a lower level of leadership and argued that transformational leadership, as a more advanced level of leadership, should augment transactional leadership behaviors.

The transactional approach to leadership emphasizes task- and people-oriented behaviors. Leaders who favor this approach focus on task completion; provide financial incentives and recognition to motivate employees; and rely on punishments to secure compliance. Transactional leaders engage in contingent reward – clarify

expectations and reward or punish employees for meeting or not meeting expectations (Bass and Avolio 1990). Transactional leaders also manage by exception: actively, by closely monitoring performance to anticipate problems and take corrective actions; or passively, by intervening only when problems arise.

The transformational approach to leadership also emphasizes people-oriented behaviors. However, rather than emphasizing financial incentives and recognition as transactional leadership does, this approach highlights the importance of organizational behaviors (Van Wart 2011). Transformational leaders engage in four types of behaviors. First, they generate *idealized influence* over employees: leaders act as role models and display ethical behavior, for which followers admire and respect them, identify with them, and want to emulate them. Second, they give employees *inspirational motivation*: leaders demonstrate commitment and raise employees' awareness about the organizational values and goals and communicate an inspiring and shared vision of the future. Third, they offer *intellectual stimulation* to employees: leaders ask for employees' ideas and encourage employees to view issues from new perspectives (Bass 1985). Last, they provide employees with *individualized consideration*: leaders show concern for employees' welfare, develop, and empower employees.

## Employee Trust in Leaders

Trust is a multidimensional construct. It is "a psychological state comprising the intention to accept vulnerability based upon positive expectations of the intentions or behavior of another" (Rousseau et al. 1998, p. 395). Trust also refers to the level of confidence a person has in others to act in fair and predictable ways. Thus, employee trust in leaders can be defined as employees' faith in leaders' intentions and confidence in leaders' actions.

According to Lewicky and Bunker (1996), three sequentially linked types of trust exist in professional relationships. At the lower level is *calculus-based trust*, "based on assuring consistency of behavior; that is, individuals will do what [leaders] say because they fear the consequences of not doing what they say" (p. 119). At the middle level is *knowledge-based trust*, which develops over time as a person gets to know another well enough to be able to predict his or her behavior. At the upper level, *identification-based trust* "exists because the parties effectively understand and appreciate the other's wants; this mutual understanding is developed to the point where they can effectively act for the other" (p. 122). When such trust exists, individuals identify with others and want to incorporate the other's ideas and ways of doing things into their own identity.

Employee trust in leaders is important within organizations. Employees who trust their leaders will not only spend less time "covering their backs" but will also work hard on required tasks and go above and beyond requirements in their performance. In addition, when employees trust their leaders, they are more comfortable sharing sensitive information or admitting mistakes. Furthermore, these employees will be more likely to defer to their leaders and accept their decisions, enabling leaders to spend less time explaining and justifying their actions.

## Employee Trust as an Outcome of Leadership

Leaders play an essential role in building and sustaining trust. From a transactional leadership approach, when leaders reward, punish, and monitor performance or underperformance consistently, employees trust and feel confident that their leaders will continue to engage in these behaviors. From a transformational leadership approach, leaders who model ethical behavior show employees that they can be trusted (Gillespie and Mann 2004). Moreover, when they communicate attainable organizational goals, leaders motivate employees to achieve such goals, facilitating the development of trust. In addition, leaders who encourage employees to view issues from new perspectives coach employees and show commitment to employee

development, further helping to build trust. Finally, when leaders show concern for their employees' welfare and empower them to make their own decisions, they show that they care and can be trusted.

Empirical studies suggest that both transactional and transformational leadership have a positive impact on employee trust in leaders. For instance, a survey of students in a public university in the United States found that both transactional and transformational leadership had a positive effect on trust in leaders. Another survey of teams in a large public research and development organization in Australia revealed that transactional and transformational leadership are positively correlated to employee trust in leaders.

Both transactional and transformational leadership are appropriate in private and public sectors. However, to be more effective, public leaders must be more transformational than transactional because transformational leadership behaviors augment the effectiveness of transactional ones (Bass and Avolio 1993). That is, the incremental change brought about by transactional leadership is enhanced when public leaders engage in transformational leadership. For example, offering incentives to followers for achieving results is enhanced by inspiring subordinates to look beyond their self-interest.

Compared to private institutions, leaders being more transformational than transactional are essential for public organizations where social purpose is more important. Further, public leaders experience more difficulties motivating their followers than their counterparts in private organizations, because they are more limited in the use of extrinsic rewards. Researchers conducted interviews with organizational leaders and found that for public and nonprofit leaders, developing others and being inspirational – competencies of transformational leaders – are more important than engaging in performance management, a behavior of transactional leaders.

Moreover, transformational leaders gain trust when their followers perceive care and concern in their relationship with leaders, while transactional leaders put more less focus on the relationship with subordinates and more on ensuring that they are seen to be fair and dependable. Also, transactional leadership does not require a high level of trust between employees and leaders (Jung and Avolio 2000). Employees only trust transactional leaders to the extent that leaders reliably execute exchanges such as rewarding employees' performance. On the contrary, transformational leaders are trusted because employees identify with them and want to incorporate into their own identity their leaders' ideas and ways of doing things. For example, a cross-sectional study of employees in a utility and entertainment organization revealed that compared to transactional leadership behaviors, transformational ones have a larger positive impact on employee trust in leaders.

## A Sample of US Federal Employees

To examine the relationship between leadership and employee trust in leaders, a longitudinal dataset was compiled using a sample of 396 US federal subagencies from 2006 to 2015. Data were collected from a federal employee survey conducted by the US Office of Personnel Management (OPM). Originally named the Federal Human Capital Survey (FHCS) in 2002, the survey became the Federal Employee Viewpoint Survey (FEVS) in 2010. OPM administered the FHCS/FEVS biennially from 2002 to 2010 and changed to surveying annually after 2010. The FHCS/FEVS consists of 73–84 core questions and 11–14 demographic items each year. During the period of 2006–2015, the government-wide response rate ranged from 46% to 57%, and the number of responses varied each year, ranging from 212,223 in 2008 to 687,687 in 2012.

The sample is limited to nonsupervisor employees only, which account for about 68% to 78% of total respondents in the 2006–2015 FHCS/FEVS surveys. Due to missing data in subagency and supervisory status, the dataset is an unbalanced panel that consists of 1494 observations for 396 federal subagencies from 2006 to 2015. Subagencies are one level below the

agency such as the US Patent and Trademark Office, Census Bureau, National Park Service, etc. While the subagencies in the sample do not fully represent the US federal government, they do cover a wide range of agencies, including all 15 executive departments and 26 independent agencies, among which, the Department of Defense, Department of Homeland Security, and Department of Justice, account for approximately 44% of the total observations.

## Regression Analysis of Leadership and Trust

The effect of transactional and transformational leadership on employee trust in leaders is estimated through a set of regressions using trust percentage and trust average in a federal subagency as the dependent variables and an index score of the transactional leadership and that of transformational leadership in each federal subagency as the independent variables. The regression model also controls for gender, race, age, retirement status, and turnover rate of each subagency. Two-way fixed effects (FE) regressions are employed to help control for unobserved factors that vary across subagencies but are time invariant (such as unique organizational structures and cultures, as well as historical circumstances for each subagency) and that change over time but are constant among subagencies (such as national policy interventions, technological innovations, and macroeconomic conditions). These unobserved factors could establish expectations in public employees about bureaucratic capacity and the potential for government success, thus affecting their trust in organizational leaders.

## Endogeneity of Leadership

Existing studies on leadership often assume that transactional and transformational leadership are exogenous behaviors, randomly occurring in organizations. However, as Bommer, Rubin, and Baldwin (2004) pointed out, "leaders do not behave in a vacuum where their own attitudes completely determine their behavior" (p. 199). That is, leadership depends on other factors, such as the organizational context (Pawar and Eastman 1997). In fact, a few researchers warn that an endogeneity problem may exist because the relationship between a leader's actions and employee trust could be reciprocal (Cho and Poister 2014). That is, while leaders' transactional and transformational leadership may help increase employee trust in them (see theoretical discussion above), it is also plausible that leaders' behaviors are simply a result of their perception of employee trust in them. If leaders think their employees have trust in them, they are more likely to engage in transformational behavior such as motivating employees to go above and beyond or give them more individualized considerations. In addition, it is possible that employees who are trusting tend to perceive their leaders to be more transformational than transactional, and employees who are less trusting tend to perceive their leaders to be more transactional than transformational.

To solve the endogeneity problem of leadership, instrumental variables (or "instruments") that plausibly generate exogenous variation in the incidence of transactional and transformational leadership need to be utilized. The instruments must be directly related to leadership behaviors, but not directly related to other unobserved factors affecting employee trust in leaders. Employee feeling of personal accomplishment ("Accomplishment") and employee knowledge-sharing ("Sharing") were proposed as two instruments. The underlying assumption is that when employees have a feeling of personal fulfillment at work, and when they share job knowledge with each other, leaders get cues from employees, which, in turn, may impact whether they engage in transactional or transformational leadership behaviors. That is, leaders may decide to empower employees, to solicit ideas from them, and to encourage them to view problems from new perspectives – all three elements of transformational leadership. Leaders may also decide to reward employees for their performance – a competency of transactional

leadership. Moreover, leaders' rewarding behavior is likely to increase as a result of employees' feelings of personal accomplishment and willingness to share job knowledge with their colleagues. Thus, it is expected that Accomplishment and Sharing satisfy the instrument relevance criterion.

In terms of instrument exogeneity, one can argue that when employees have a feeling of personal accomplishment at work and share job knowledge with each other does not necessarily mean that they trust their leaders. Employees may derive a feeling of personal accomplishment because of the nature of the work they perform, such as the monetary and social benefits the work provides, or their beliefs that the tasks they complete are meaningful and make a difference in people's lives. While leaders may set up easier or harder tasks for employees to complete, it is the nature of the task itself that influences whether employees derive a sense of achievement when performing it. Having such a feeling of accomplishment does not mean that employees will necessarily trust their leaders. Similarly, employees may distrust their leaders but still hold a feeling of personal accomplishment because the work they do meets their biological, social, and psychological needs.

As for employee knowledge-sharing behavior, employees may be willing to share job knowledge in order to have their peers reciprocate this behavior. Also, employees may be intrinsically motivated to share job knowledge with their peers. That is, they may want to do it for its own sake, for the mere pleasure and satisfaction they get from engaging in this behavior, which can facilitate the development of trust among employees themselves, but not necessarily the development of employee trust in leaders – the dependent variable in this study.

On average, approximately 65.9% of employees in a subagency have trust in their leaders, and the mean score of trust in a typical subagency is 3.7 (somewhere between "Neither Agree nor Disagree" to "Agree"). The mean scores of transactional and transformational leadership behaviors in a typical subagency are 2.9 and 3.3, respectively; both measures have a standard deviation of 0.2. In addition, employees in the sample seem to feel self-accomplished and share knowledge with each other well, with a mean score of 3.8 for Accomplishment and 3.7 for Sharing.

## Regression Results

Regression results from models that treat transactional and transformational leadership as exogenous events indicate that both transactional and transformational leadership are likely to have a positive impact on employee trust in leaders, holding all other things constant. Nevertheless, a closer look at the results shows some contradictions. On one hand, the effect of transactional leadership on the percentage of employees who trust their leaders appears to be larger than that of transformational leadership. On the other hand, transformational leadership appears to have a larger effect on the mean score of employee trust in leaders than transactional leadership.

However, regression results from models that treat transactional and transformational leadership as endogenous events indicate that only transactional leadership is likely to have a positive impact on employee trust, holding all other things constant. It is important to note that the effect is much larger than the one obtained from the exogenous models.

Regarding the control variables, the results of the endogenous models are similar to the ones obtained from the exogenous models. That is, the percentage of minority employees has a negative impact on both the percentage and mean score of employee trust in leaders. This suggests that public leaders need to do a better job at engaging diversity within their organizations.

Also, the results show that time affects employee trust in leaders. The year dummies show statistical significance in both exogenous and endogenous FE models. In the endogenous models, the year 2008 is negatively associated with employee trust in leaders, measured as both percentage and average, while other years show positive correlations with employee trust. This indicates that the relationship between leadership and employee trust does change over time. For

example, the overall economic condition of the nation during the 2007–2009 Great Recession could have had a significant impact on the perceptions of federal employees about their leaders. Cross-sectional studies that do not consider time changes may have produced biased estimates.

## Conclusion

Time is an important factor affecting employee trust in leaders. The results show the relationship between leadership and employee trust is dynamic and can change over time. Thus, the use of longitudinal data is necessary for more accurate estimates of the effect of leadership on employee trust. In addition, the findings suggest that transactional leadership leads to higher levels of employee trust in leaders, which is consistent with existing cross-sectional studies in which transactional leadership has been treated as an exogenous event. However, contrary to these studies, the effects are much larger in magnitude. This suggests that previous studies that do not address the endogeneity of leadership may have underestimated its impact on employee trust in leaders.

Interestingly, controlling for leadership's endogeneity, this study finds no evidence that transformational leadership promotes employee trust in leaders. Although the results in the exogenous models are consistent with previous findings suggesting that transformational leadership leads to increased levels of employee trust in leaders, endogeneity is an important issue that must be addressed. The results in the endogenous models using the instrumental variable approach are more robust because they isolate the exogenous part of leadership, which, in turn, allows for consistent estimation of the regression coefficients.

While transformational leadership does not show statistical significance in the endogenous models, one should note that employees may not necessarily see a connection between transformational leadership and trust in their leaders. When asked if they trust their leaders, employees may only be thinking about calculus-based trust (e.g., whether leaders are consistent in rewarding performance) and not the types of trust that transformational leaders can build: knowledge-based trust and identification-based trust. This means that employees have not actually experienced higher levels of trust in their leaders. If so, both leaders and employees in the federal government would need leadership training that combines "coaching, classroom instruction, feedback, and experiential training" (Seidle et al. 2016, p. 603). In this way, leaders would improve their transformational leadership skills and become more effective at building employee trust; employees, in turn, would be better prepared to be effective leaders in the future.

It is also important to mention that the positive impact of transactional leadership found in this study may simply reflect that leaders who favor this leadership approach only gain conditional, calculus-based trust of their followers. That is, employees may only trust their leaders as long as they are seen as consistent in executing exchanges, such as rewarding performance. Although it may not be enough to unleash employees' full potential, developing trust based on a calculus of costs and benefits is still important for leaders in the federal government. This is because calculus-based trust enables higher levels of trust to develop, such as knowledge-based trust and identification-based trust.

Furthermore, given the results in this study, leaders in the federal government need to do a better job at gaining trust from diverse employees by creating a more supportive organizational culture that values the different perspectives of the employees.

# Leadership and Religion

Gary E. Roberts
Robertson School of Government,
Regent University, Virginia Beach, VA, USA

## Synonyms

Ethical and moral leadership; Faith in the workplace; Leadership and spirituality; Leadership ethics; Moral leadership; Religion in the workplace; Religious friendly workplace; Religious leadership; Role of religion in leadership decision-making; Separation of church and state; Servant leadership and religion; Servant leadership; Workplace spirituality

## Definition

Leadership and religion is defined as how the adherence to a formal and codified system of beliefs on the nature of the transcendent and the purpose of life influences the job-related attitudes and behaviors of public managers and executives with special emphasis on the policy and management decision-making process.

## Introduction

The interface between leadership and religion is a foundational global dimension that influences all aspects of public administration given its ubiquitous role in the human condition. Recent data from the Pew Foundation indicates that 84% of the world's population is religiously affiliated and is set to increase to 87% in 2050 (Gümüsay 2018; Pew Research Center 2015). This entry will summarize the primary conceptual and empirical research on the influence of religion in the general leadership literature with special focus on the unique organizational environment of public administration. The literature demonstrates an overall positive effect of religion on leadership, but with many complex moderator and mediator variables.

## Unique Environment of Public Administration

One of the founding attributes of the United States political system as Alexis De Tocqueville observed is the role of religion in its democratic foundation (Fulton and Wood 2018). The United States and many other democratic constitutional systems are characterized by freedom of religion, but with legal limits on its formal integration within the public administration system. The separation of church and state doctrine as well as

legal and ethical requirements for religious neutrality require governmental administrators and employees to make policy and management decisions using secular deontological, teleological, and character virtue-based professional values and norms that promote the greater public interest. However, religious values and beliefs cannot be completely compartmentalized from the leadership decision-making process of individual public administrators given the varying degrees of religiosity and religious commitment that influence the salience of religion at the internal psychological level. Religious belief is widespread in the general population and within the ranks of public sector employees. Research in the United States demonstrates that public employees are more religious and manifest less secular attitudes than employees possess in the business and nonprofit sectors (Houston et al. 2008). In addition, US public employees exhibit a higher level of spirituality related to achieving transcendence, demonstrating compassion for others, perceiving interconnectedness, and experiencing life meaning (Houston and Cartwright 2007). Public employees in the US demonstrate little religious denominational difference with the general population, but demonstrate higher levels of commitment and activity to their religious communities (Freeman and Houston (2010). However, there is no empirical evidence on the formal or informal integration of religion into the leadership decision-making process.

## Differentiating Religion and Spirituality

One of the challenging elements of assessing the influence of religion on leadership is the symbiotic relationship of formal and established religious belief systems and generic spirituality and the complexity of religion given the vast diversity of religious belief, expression, and experience both within and between religions. There is an inherent overlap between religious and spiritual values and principles with many spiritual principles manifesting a genesis in formal religion. Hence, from a research measurement standpoint both constructs present operational and conceptual challenges. The legal definition of religion in the United States was established in a 1982 Federal Court of Appeals Ruling in *Africa v. Commonwealth of Pennsylvania* (1981):

> First, a religion addresses fundamental and ultimate questions having to do with deep and imponderable matter. Second, a religion is comprehensive in nature; it consists of a belief system, rather than an isolated teaching. Third, a religion often can be recognized by the presence of certain formal and external signs (Bruce 2000a)

There is no equivalent legal definition of spirituality with dozens of variants appearing in the research literature. However, the work of Bruce (2000b) provided a five-element definition of spirituality in the public-sector workplace consisting of promoting harmonious relationships, the pursuit of personal and collective character integrity, the integration of holistic and authentic love promoting the best interests of others over self, the search for enduring life purpose and meaning, and achieving a sense of the transcendent.

## Pro and Con Arguments for Integrating Religion into Leadership into the Public Sector

The debate on the proper role of religion in leadership within the public sector is ongoing and intense. The proponents of permitting public administrators to integrate religious values into leadership decision-making center on three aspects, promoting diversity and the richness of human experience, improving the quality of decision-making, and enhancing the morality and ethicality of government. The three main global arguments contrary to the integration of religion are (1) The US constitution requires governmental neutrality regarding both policy and leadership decision-making given the separation of state and states (2) that the formal integration of religion enhances conflict and division given the reality of conflicting mutually exclusive religious truth claims, and (3) that religion introduces a non-rational form of reasoning eroding decision making quality.

A proponent of religious integration into the workplace, Douglas Hicks (2003), presented three principles to govern religious expression with elaboration by Roberts (2015):

1. Spiritual and religious expression must observe and honor the dignity of all persons and the diversity of religious and nonreligious views in the workplace. For example, on an organizational listserve that communicates training principles, it would be appropriate for a public agency director to discuss the integration of scriptural servant leadership principles into the workplace, but it would not permit the posting of biblical passages condemning gay marriage. As a Christian evangelical, the leader's personal religious beliefs may oppose same sex marriage, but they cannot be expressed in an official internal media platform to protest legally established public policies.
2. All religious and spiritual expression is voluntary and explicitly and implicitly non-coercive precluding either a promise of benefit or threat of loss.
3. There can be no formal establishment of a "state" religion or spiritual practice.

Hicks (2003) posits that a forced compartmentalization of religion and spirituality in the workplace disenfranchises those with genuine religious and spiritual beliefs and diminishes the richness and vitality of the human experience at work.

## Levels of Analysis in Integrating Leadership and Religion

The research literature on the relationship between leadership and religion addresses almost exclusively the private and nonprofit sectors. However, there is scant empirical research on the integration of religion and its effects across all social science domains. There are clearly unique contextual differences between the sectors, but there are no a priori rationales to conclude that public sector leaders possess unique attributes or employ a different approach to the decision-making process. There is no single comprehensive framework for the integration of religion into leadership. A synthesis of the existing literature generates the following religion and leadership dimensions.

1. *Levels of Analysis:* The organizational level in which leadership is exercised consisting of line employees, group leaders, first-level supervisors, mid-level managers, and executives. For example, at the executive level, decision-making entails organization-wide strategic variables such as mission, vision, service, or product change and responding to organizational failures in which religious elements such as God's will and purpose can play an internal role in the leader's thinking and reasoning (Phipps 2012). At the first-level supervisor level, one important leadership dimension is performance management that frequently entails the integration of religious principles such as forgiveness and patience (Roberts 2015).
2. *The Decision Making Process:* Identifying the various religious values, attitudes, behaviors, schemas, and worldviews that characterize varying religions that are applied to the decision-making process. For example, studies of this genre address how sacred writings influence leaders and the adoption of such practices as prayer and meditation (Kriger and Seng 2005).
3. *Level of Integration into the Workplace:* Assessing the degree to which leaders indirectly to directly integrate religion into their work (ranging from direct integration to compartmentalization) and the associated mediation variables such as degree of religiosity, religious commitment, and spiritual discipline practices (Phipps 2012).
4. *Organizational Moderators:* Degree of formal support for religious integration through the religious friendly workplace is a potential important moderator that accentuates the validity and application of religion into the leadership process. The elements of the religious workplace include (Cash et al. 2000):
   (a) Nondiscrimination policy for religious (or nonreligious) belief & practice
   (b) Religious practice workplace policy that clearly defines permissible activities

(c) Reasonable accommodation strategies to adjust work duties to accommodate religious beliefs and practices
(d) Leave policy for religious observance
(e) Religious diversity and discrimination avoidance education of managers and employees
(f) Allowance for voluntary prayer/meditation and study time during the work day (breaks, lunch, etc.) and during non-working hours
(g) Permit voluntary prayer before each work day and at events and meetings
(h) Promote religious and spiritual events, retreats, seminars, service, and volunteer opportunities
(i) An employee website or bulletin board to promote religious/spiritual activities (not available to the public)
(j) Policy that permits the display of religious objects in the office and in employee dress
(k) Workplace chaplain program
(l) Religious mental health counseling programs
(m) Religious-based wellness and employee assistance programs
(n) Permit employees to transmit religious information on company email or intranet system

5. *Religious Moderators:* Type of religion, inter and intra religion differences, gender, age, race, and other personal characteristics, region/nation, and culture. The focus of the research is to identify the commonalities and differences between religions and how they conform, differ, and can strengthen established secular leadership approaches. For example, Gümüsay (2018) developed a framework to analyze the major Abrahamic religions (Judaism, Christianity, Islam) using three shared religious principles, (1) the belief in the existence of and relationship to a god, (2) the faith in and pursuit of a hereafter purpose, and (3) the belief in and attempted adherence to a sacred scripture, and how these principles were reflected in moral theories of leadership including ethical, authentic, spiritual, and servant leadership. Kriger and Seng (2005) completed a detailed ontological analysis of the five major world religions (Christianity, Islam, Judaism, Hinduism, and Buddhism) analyzing their commonalities and their respective contributions to expanding and improving behavior-based leadership theories. For example, each of the major world religions promotes a "golden rule" emphasis on love as a foundational decision rule reinforcing the importance of employee growth and development as a foundational leadership dimension. A study by Ayyash-Abdo (2001) compared the leadership styles of Christian and Muslims in Lebanon and found that Christians adopt a more individualistic approach in contrast to the more collective perspective of Muslims. A final example is a study in France, Germany, and the United Kingdom as how strategies for resolving conflict varied by religion with Christians preferring a dominating style while Muslims a more obliging and compromising style (Croucher 2011).

6. *Ethical Behavior and Decision Making:*
(a) For example, are religious leaders more ethical than their secular counterparts? The research evidence is mixed, moderated by such factors as the degree of religiosity with a higher level associated with conduct that is more ethical while other studies demonstrate lower levels or no difference (Phipps 2012).
(b) Conflict between religious practices and secular ethics. How adherence to religious norms and values may conflict with secular ethical principles. That is, how adherence to "God's will" or direction leads to behavior or outcomes deemed unethical in the secular realm (Phipps 2012). For example, should a leader override organizational rules for the immediate termination for employee theft given their religious values that emphasize grace, mercy, and forgiveness as guided by prayer and the leading of the holy spirit? Other empirical research explores how leadership adherence to religious principles can intentionally or unintentionally exploit employees through guilt and manipulation or claims that

"God's will" or direction requires sacrifices thereby promoting or justifying excessive work levels, lower salary, or more adverse working conditions (McCormack et al. 2014; Gümüsay 2018).

## Summary of Empirical Evidence on the Influence of Religion on Leadership

The overall breadth and depth of empirical research on the influence of religion on leadership is sparse, with the majority research conducted in the private sector. McCormack et al. (2014) summarize an array of research literature demonstrating a generally positive influence of religion in the workplace in terms of improved mental health, a stronger sense of community, a greater sense of employee purpose, ethical behavior and decision-making, overall higher organizational effectiveness, and a generally favorable influence of religion on management decision-making. However, there are significant gaps in research at all levels, hence the need for ongoing research investment.

## Leadership and Religion Case Example, Servant Leadership

To demonstrate an example analysis of religious integration into leadership study, the work of Roberts (2015) on the universality of servant leadership is summarized. Servant leadership has been demonstrated to be an effective leadership approach across a wide range of cultures (Roberts 2015). Servant leadership emphasizes the role of leader as promoting the mission and the best interests of employees through employee empowerment and development (Roberts 2015). This final section illustrates how the four major religions reinforce servant leader principles through their foundational belief and values systems.

### Important Servant Leader Attributes in Judaism

Judaism emphasizes many key elements consistent with servant leadership. It begins with the promotion of a division of power to avoid excessive degrees of centralization of authority. This was reflected in the communal nature of leadership in the synagogue. Another key element is the emphasis on delegation and empowerment as seen in Exodus 18, when Moses assigned 50 worthy men to serve as judges to reduce his workload and lower waiting times, as well as the importance of an organized leadership succession process as recorded in Deuteronomy 31.

### Important Servant Leader Attributes in Christianity

Christianity is the religion that explicitly endorses many key elements consistent with servant leadership. It begins with an overt Christological focus as leaders are called to authentic discipleship based on the example of Jesus Christ. Hence, there is imitation of the Divine, as leaders strive to reproduce the character, behavior, and conduct of Christ in accomplishing the organization's mission (Bekker 2010). Servant leaders strive to use power in a meek and humble fashion, recognizing that their source of authority comes from God, and their role as stewards in using power to honor God through mission accomplishment and the growth and well-being of followers.

### Important Servant Leader Attributes in Islam

Islam emphasizes the importance of integrity by leaders. For example, its teachings claim a harmony between the life of Mohammad (the founding prophet of Islam) and the teachings of the Koran on the foundational importance of virtuous character attributes and being an authentic adherent and example (Kriger and Seng 2005; Bekker 2010). Islam views leaders as "caretakers" entrusted by Allah to steward carefully the precious human, animal, material, and monetary resources given by God (Kriger and Seng 2005).

### Important Servant Leader Attributes in Buddhism

Buddhism enumerates many teachings consistent with servant leadership. Leaders in

Buddhism are called to embrace altruism and our universal interdependency within a system. The foundation is the shared character traits (the four immeasurable states) of love, compassion, joy, and equanimity (calm temperament under stress) (Kriger and Seng 2005; Bekker 2010). The ultimate example of servant leadership in Buddhism is the Bodhisattva, a leader who sacrifices his or her personal opportunity to achieve enlightenment (the cessation of desire and achieving unity with the universe) to help others struggling with personal character growth (Bekker 2010).

## Conclusion

The relationship between religion and leadership in public administration is an area of intense interest generating divergent views on the appropriateness and efficacy of religious integration in policy and decision-making. Given religion's foundational role in society, the debate will continue with varying degrees of intensity and conflict.

## Leadership and Social Justice

Sherry Penney
University of Massachusetts Boston, Boston, MA, USA

### Synonyms

Leadership: Guidance, Direction, Control, Management, Supervision, Coordination, Teamwork, Collaboration; Social Justice: Human rights, Common Good, Equality

### Introduction

The twenty-first century is characterized by a climate of complexity, ambiguity, uncertainty, and constant change. This atmosphere provides new challenges to leaders everywhere. In this context an understanding of the need for attention to social justice by leaders becomes paramount.

The meaning of social justice in the world setting and in the United States has generated much discussion and had various meaning over the years. Catholic thinkers who were prominent in discussions of the meaning of social justice looked back to Saint Thomas Aquinas and his emphasis on the appropriate balance between individual liberty and community responsibility. In the early years of the nineteenth century, the term was used more widely. It also referred to social action as a means to social justice and was very applicable to the 1848 revolutions in Europe. In the United States as well as Europe, it was also a time of reform movements in many social justice areas, particularly women's rights and the anti-slavery movement. These discussions as well as ones in later centuries, however, often did not include substantial input from those who were marginalized – those for whom the social justice initiatives were intended.

In the latter part of the nineteenth century, the idea of social justice and the role of the community and the responsibility of its citizens to each other were outlined by John Stuart Mill in *Utilitarianism* where he calls on individuals to understand the association between their happiness and the good of the whole. In the twentieth century, social justice concepts for the United States, in particular, were also promoted by John Dewey, who advocated new methods for the education of citizens. Throughout the twentieth and twenty-first centuries, much of the research and writing about social justice centers on improving social justice in education, particularly advocating for quality education for all individuals (Brown 2009).

The social justice idea was also prominent in works by John Rawls (1971), who focused on justice as fairness – as distributive justice. He called for basic rights of citizens as free and equal persons. Following the thinking of Rawls, theologians' and philosophers' discussions of social justice often related it to the broader issue of human rights. That discussion continues to the present time and human rights are more and more a prominent component of social justice.

In the late nineteenth and early twentieth centuries, several of the tycoons of business, such as Rockefeller, Carnegie, and Ford, all provided substantial funding to address many social concerns and also established foundations to continue their work (Bugg-Levine and Sullivan 2015). This generosity continues to this day through their foundations and set a high standard for other businesses to follow. However, paradoxically, these and many other successful individuals did not make social justice and employee working conditions a primary objective of their **own** businesses. Many contemporary business organizations also have established foundations, which

support a variety of social justice activities. This tradition of corporate philanthropy centered on social justice initiatives has seen major contributions from organizations such as the Gates Foundation as well as Mark Zuckerberg's commitment in a variety of social justice areas.

In spite of many generous gifts, successful social change efforts are often more difficult to measure than traditional business success and only a small portion of large philanthropic gifts (excluding the Gates Foundation) is focused on social change (Foster et al. 2016). Many of the large gifts go to established institutions: symphonies, theaters, art museums, hospitals, universities, and the like.

In the twenty-first century, social justice continues to have various meanings, which usually include the idea of fair relations between the individual and society. This view relates justice to a reciprocal relationship to society. Issues such as health care, poverty and income equality, working conditions, education, criminal justice, mental health, housing, and the environment are frequently part of social justice efforts. Recently the idea of social justice has been expanded to include a greater focus on green/environmental issues and increased corporate social responsibility (Penney and Neilson 2010). It is noteworthy that some pension funds in the United Kingdom, Scotland, and Sweden are now moving toward "green" investments and this trend will likely continue. Two of the largest pension funds in the world CalSTRS and CalPERS are selling fossil fuel investments. Strategies that consider climate change an important component of social justice look to become more significant in the twenty-first century (Rodriguez-Montemayor 2016). Those involved in social justice endeavors may participate in some or all of the above areas. Social justice activities continue to be supported by private foundations, corporate philanthropy, nonprofit organizations, and/or governmental agencies.

In 2015, Michael Novak and Paul Adams in *Social Justice Isn't What You Think It Is* take another look at social justice and again refer back to the Catholic tradition. They discuss the concept of the free individual and the role individuals must play in fostering social justice. Discussions of the role of the individual in solving social problems along with that of societal and governmental organizations' involvement in social justice continue, with some stressing the individual's responsibility and others seeing a broader role for governmental agencies, nonprofits, and others.

However, the need for successful social change initiatives continues to grow along with requests for additional financial support and research on what efforts are the most successful and why. An important challenge now and in the future is to increase the effectiveness of social justice efforts as well as to enhance replication of successful initiatives. Recently, some individuals who desire to improve successful social justice outcomes are promoting the idea of "emergence." They believe that efforts to solve complex social problems work best when diverse individuals work together with a shared goal, while acting on their own without an individual (a leader) directing them (Darling 2016). This practice, which builds on previous work in collaboration, team building, and cross-sector networking, shows promise for tackling and resolving difficult and long-standing social justice issues (Penney and Neilson 2010).

There are many successful social justice initiatives throughout the world, but many of these efforts are not well known outside their immediate geographical areas. Other gains have been made in more general areas such as improved working conditions with labor laws and regulations in place. Diseases such as polio are largely eradicated, and substantial progress in AIDS research and treatment has taken place. So views on social justice continue to vary, and the work involved in fostering social justice continues in many different forms and in various cultural settings. Because of the complexity of issues facing society in the twenty-first century, increased attention must be paid to social justice and its importance. Without improvement in the many social justice initiatives, societies throughout the world will face increasing problems, and the solutions will be more difficult to achieve the longer the problems persist.

Leadership, too, has had and continues to have a variety of meanings. President John Quincy

Adams provided an excellent summary: "If your actions inspire others to dream more, learn more, do more and become more, you are a leader" (www.brainyquotes.com). Others have stated that leadership involves leaders, followers, and a common goal. In recent years the role of followers has become more pronounced. The need for collaboration and teamwork is stressed as necessary for effective leadership as well as for successful change efforts. Leaders also are called upon to empower others, particularly those with whom they work. Leadership development often includes exercises in teamwork, strategies for change, collaboration, context, gray thinking, networking, communication, as well as explorations about purpose and authenticity.

The most recent generations of emerging leaders have indicated that they want new models of leadership. They are anxious to lead but do not want to lead as they have been led. Their ideas are important since in the United States alone, some several million Boomers will be retiring in the next decade. Those in Gen X and Y (X, born 1965–80; Y, born 1981–99) will be assuming leadership positions as Boomers retire, and many of these individuals demonstrate a strong social justice commitment.

Previous views on leadership, which assumed leadership was reserved for a few individuals and that only a select few could become leaders, are no longer as popular as they once were. This view equated leadership with a capital "L" – a powerful individual leader was in charge, and followers would follow such a person believing that she/he would solve problems and support needed reforms (Penney and Neilson 2009). This view encompassed, in particular, the political and business sectors. Gradually it has been replaced with a different view of leadership.

The twenty-first century calls for leaders at all levels of society whether on college campuses, in religious organizations, in communities, in government, or in business. For effective leadership in the twenty-first century, the assumption is that it is possible for everyone to lead and that leadership means making a difference. Leadership with a small "l" is a more powerful concept. This leadership is collaborative and supports the concept that everyone has the potential to be a leader. Worries about "groupthink," as teamwork in organizations becomes the norm, create a concern for some individuals. However, most leadership practitioners see that teamwork is important but also recognize the need for people to spend time engaging in innovation and creative thinking outside of teamwork settings.

The generations (Gen X, Y, and Z) that have followed the Boomers show a commitment to social justice and to corporate social responsibility, which become important factors as they choose where to work and whether to remain in an organization. Many of these individuals believe that it is important for individuals to be involved in their communities and to participate in a variety of social justice areas. Individuals in private businesses are becoming more aware of social justice issues and of the need for them to be civically engaged. For Gen X, a focus on community service is of significant importance (Penney and Neilson 2010).

Leadership captured the headlines when *Time* (2006) noted that the Great Man Theory of History sees "the history of the world is but the biography of great men. Carlyle to whom the Great Man theory is attributed believed that it is the few, the powerful and the famous who shape our collective destiny. The Great Man theory of leadership took a serious beating this year." Instead of choosing a person of the year, as was traditional, the magazine supported collaborative leadership and stated: "It's a story about community and collaboration on a scale never seen before."

One promising aspect of this expansion of the understanding of both social justice and leadership is that leaders in the first decade of the twenty-first century are turning more and more to an understanding of the need for social justice as an essential component of effective leadership. Combining social justice concerns with leadership is, therefore, a very positive development. It expands what we mean by social justice and what is required for effective leadership.

Societal factors continue to bring social justice issues to the forefront of discussions and public policy. Income inequality has contributed to social injustice and income disparity has been increasing since the 1980s. Michael Sandel (2009) shares his

concern that the growing inequality in American life undermines the very nature of democratic citizenship and that attention should be given to a reconstruction of the infrastructure of civic life. This issue becomes more significant as the global population continues to increase and may reach nine billion by 2050 (Sowcik et al. 2015). These factors call on leaders to address issues of environmental concern and availability of technology as well as more traditional social issues, particularly as the Earth's population increases.

Social justice concerns are also becoming issues for those in business. In 2011, several authors contributed their views on the need for businesses entities to address social justice by examining, "What Great Companies Do Differently." The need for social justice initiatives was emphasized, and the general conclusion was that companies that perform best over time are the ones that build a social purpose into their operations. Rosabeth Moss Kanter points out that companies are more than instruments for generating money. They are also vehicles for accomplishing social purposes and for providing meaningful livelihoods for those who work for them. Moreover, she notes that "conceiving of the firm as a social institution serves as a buffer against uncertainty and change by providing corporations with a coherent identity" (Kanter 2011). This expanded concept of social justice as part of a company goal for both its internal constituents as well as external needs is important as it relates to a renewed commitment to social justice. Organizations which champion their social justice external efforts can certainly be criticized when their internal structures do not provide social justice to their workers in terms of working conditions that promote fair wages, family leave policies, suitable working conditions, and day care. This topic has also become one that is now regularly discussed by boards of directors. Moreover, companies that claim that they serve society demonstrate credibility when the leaders themselves allocate time, talent, and resources to community projects.

Alison Beard and Richard Hornik (2011) highlight five companies which, they suggest, do more than play lip service to community engagements. In addition, these companies have succeeded commercially, providing evidence that doing the right thing does not conflict with bottom line numbers. Heerad Sabeti (2011) sees this change more broadly and praises for-profit businesses that are dealing with social and environmental issues (HBR 2011).

It is not surprising, therefore, that in 2015 the list of the 100 top business leaders (HBR 2015) included a social justice component, which it had not done in earlier such surveys. In addition to measuring country-adjusted total shareholder return, industry-adjusted total shareholder return, and change in market capitalization, this survey added what they called ESG (environmental, social, and governance) performance measures. Economic factors counted for 80% in the listing and the social justice factors accounted for 20%.

The person at the top of the list – No.1 of the 100 – was Lars Sørensen of Novo Nordisk in Denmark. That company was cited for having a measurable engagement with social and environmental issues. Sørensen notes that, "in the long term, social and environmental issues become financial issues" (Ignatius 2015). No. 2 was John Chambers of Cisco System in the United States. The 100 CEOs represent 23 nationalities and businesses located in 19 countries. Many other individuals, who could be identified as leaders in the business world, had lower rankings on the list because their businesses did not measure high on ESG issues (HBR 2015).

It is interesting to note that Warren Buffett, the well-known and highly respected business leader, was 101 on the list. Buffet's ESG performance ranked 789 out of 907 CEOs. However, his son, Howard Buffett, has worked on social justice initiatives particularly to increase knowledge of sustainable farming techniques and is chair and CEO of Howard Buffett Foundation (Buffet 2016), which is, in part, focused on socially conscious investments.

Leaders in this century need vision, need to be change agents, need to be collaborative, and promote team work and employee engagement and empowerment, but they also must be committed to social justice in order to provide a positive future for younger generations. Many areas require increased attention from international and local governmental agencies, nonprofits, and communities. Social justice is no longer optional.

Social justice concerns must be a major part of any leader's agenda in the future. Counting social justice commitment as a significant part of effective leadership is now not only moving into discussions in boardrooms but also becoming essential to overall policy in many organizations. An understanding that social justice is important not only to organizations but also needed to make societies stronger is a predominate feature of the twenty-first century.

These are the times of ambiguity, constant change, complexity, and uncertainty, and helping people develop a set of leadership "skills/competencies" is no longer sufficient. To deal with the new realities and solve social justice issues, individuals must develop and use advanced networks. Networks of individuals working collaboratively on complex issues are better able to develop strategies for dealing with ambiguity. Individuals need to take more time than previously to understand the total context of an area of concern and of all the players involved. Most issues are not black and white but are gray, and gray thinking – thinking which looks carefully at all sides of the issues before making a hasty decision one way or another – is essential (Sample 2002). Solutions often are not evident because many of the problems are more complex than previously, and answers and possible solutions will come from new ways of thinking and new ways of people working together.

## Conclusion

Leaders must be committed to social justice, be comfortable with change, and dedicated to helping their organizations prepare for and deal with these realities. So welcome to the leadership for the twenty-first century. It is collaborative and inclusive, champions change now and in the future, and requires a commitment to social justice. The future portends to be one of permanent white water, and enlightened leadership will help us navigate the waves and rocks in our path. Actions and positive results related to social justice will not be a choice for leaders. Social justice is an imperative.

Integrity; Morals; Principles; Public Integrity

### Definition

Administrative leadership: Leadership from the frontline supervisor (or even lead worker) to the nonpolitical head of the organization (Van Wart 2003).

Affective leadership: Leadership that accounts for emotional labor demands in an organization, where emotional labor is the effort to suppress inappropriate emotions and/or elicit appropriate emotions within oneself or in another person, as determined by demands of the job (Newman et al. 2009).

Ethical leadership: Fostering ethical conduct in organizations and setting ethical standards that govern the organization's members (Jurkiewicz 2006).

## Eras in Leadership Theory

Leadership is distinguished from management as follows: "If you can count it, you can control it, you can program it, and therefore you can manage it. If you cannot count it, you have to do leadership" (Fairholm 2004, p. 578). Administrative leadership is addressed separately from executive leadership, where administrative leadership focuses specifically on public sector organizations. Van Wart (2003, p. 216) defines administrative leadership as "leadership from the frontline supervisor (or even lead worker) to the non-political head of the organization." Van Wart analyzes the public administration literature on administrative leadership and reveals six distinct eras in mainstream leadership research (2003, p. 218):

1. **Great man thesis**: Emphasizes the emergence of a great individual who has a substantial effect on society, pre-1900s through the present.
2. **Trait theory**: Emphasizes individual traits and skills of leaders and leadership as an inborn attribute rather than a skill to be learned (1900–1948).
3. **Contingency theory**: Examines the situational variables leaders must deal with and represents a shift from traits to behaviors and influenced by human relations theory and behavioral science (1948–1980s).
4. **Transformational theory**: Underscores the importance of leadership to change organizations, processes, or overall culture, influenced by the decline of American dominance in business, finance, and science and the need to reenergize faltering industries (1978 to present).
5. **Servant leadership theory**: Stewardship approach characterized by its emphasis on a leader's ethical responsibilities to internal and external audiences further underscores legal responsibilities of public sector leaders and central role of the citizenry (1977 to present).
6. **Multifaceted leadership theory**: Emphasizes the integration of different streams of thought about leadership, particularly transactional schools of thought (trait and behavior) and transformational schools (stewardship and entrepreneurial) (1990s to the present).

Van Wart (2003) notes that over time, scholarship and perceptions on leadership have evolved from trait perspectives that emphasize the innate character of leaders to leadership as a skill that can be learned and then back to a more nuanced version of trait theory, where leadership can be learned, but certain characteristics are identified in leaders that can be assessed and cultivated. While selected traits and behaviors are now better understood, current multifaceted leadership theory is "a more sophisticated model that could accommodate entirely different missions and environments" (2003, p. 224). But research focused in particular on public service is necessary to understand the special circumstances posed in the public sector because "entrepreneurial behavior cannot be blithely endorsed when public administrators are entrusted with the authority of the state" (2003, p. 224). Reform pressures over the past decades are also unique to the public sector and provide a context that differs from mainstream executive leadership research.

As an entry based not solely on leadership, but rather leadership and society, this essay takes as its starting point the considerable groundwork laid by the Van Wart (2003) analysis and looks to innovative areas of leadership study – ethical leadership, affective leadership, and feminist leadership – and ends with by speculating on exciting areas for future inquiry.

## Ethical Leadership

Ethical leadership expands the notion of leadership to include the leader's own actions to serve as an example of ideal behavior. Carole Jukiewicz defines ethical leadership as "fostering ethical conduct in organizations and… set[ting] ethical standards that govern the organization's members" (2006, p. 246). Bedi, Alpaslan, and Green further specify the leader's individual behavior: "Ethical leaders are fair, honest, and principled

individuals that use various forms of rewards, punishments, and communication mechanisms to influence their followers' ethical behavior" (2015, p. 1). While the individual leader's behavior is the focus, her or his actions and choices must be made known to others. Ethical leadership is in the perception of coworkers, subordinates, and peers of fair decision making, trustworthiness, communicating openly on ethical issues, and behaving in an ethical manner. In this way, ethical leadership is interpersonal, perceptual (Heres 2014), and at least partly performative. Capturing the perceptual aspect of ethic leadership, Don Menzel (2015b, p. 316) emphasizes "three basic ingredients: being an ethical role model to others, treating people fairly, and actively managing ethics in the organization." A leader's ethical behavior affects others through social learning theory, which "focuses on the antecedents and consequences of ethical leadership, and suggests that individuals learn the norms of appropriate conduct … through their own experience and by observing others" (Bedi et al. 2015, p. 2). Ethical leadership reflects and shapes organizational values and ethical leaders serve as exemplars representing the organization to others (Lu and Guy 2014; Menzel 2015a; Podger and Menzel 2014). In their meta-analysis of outcomes, Bedi et al. (2015) find ethical leadership increases job satisfaction, organizational commitment, and organizational citizenship behavior a willingness to report ethics violations (Hassan et al. 2014). An absence of ethical leadership is related to higher rates of turnover intention and absenteeism (Bedi et al. 2015). Ethical leadership is linked to more effective governance (Jurkiewicz 2006; Menzel 2005; Menzel and Jurkiewicz 2005) and mitigates the negative impact of emotional labor on public servants (Mauno et al. 2016). Jurkiewicz and Thompson (2000) examine organizational and executive ethics in healthcare and the role of leadership during times of change and find that an organization's ethical environment changes only very slowly. In sum, ethical leadership expands the purview of responsibility for leading an organization beyond the narrow concepts of efficiency and organizational performance. Leaders also set examples for ethical conduct for others in the organization. Another interesting area of inquiry into leaders and leadership takes account of emotions in organizations and has been studied as affective leadership.

## Affective Leadership

Affective leadership is that which accounts for the emotional labor demands in an organization. Emotional labor is the effort to suppress inappropriate emotions and/or elicit appropriate emotions within oneself or in another person, where "appropriate" and "inappropriate" are dictated by the demands of the job. Emotional labor is so fundamental to some jobs that to fail to engage in it is to fail to do the job. Skills fundamental to emotional labor and leadership are essential to quality public service. Fairholm (2004, p. 578) notes that the concept of "leadership issues in terms of values and relationships" dates as far back as Mary Parker Follett, Chester Barnard, and Dwight Waldo, but the dominance of cognitive factors in leadership theory has eclipsed the important role of emotions in organizations. Citizen satisfaction and customer service matter to organizational performance, and an emotionally engaged leader plays a pivotal role in their determination. Public sector reforms over the past few decades – most notably New Public Management reforms – have created an environment where understaffed public services must meet the same customer expectations as business establishments. In such an environment, positive exchanges become a benchmark for organizational performance. When citizens meet friendly street-level bureaucrats – or those whom they perceive to be friendly – the public is more likely to have a positive assessment of services rendered and of public services in general. Citizens may complain about government but might compliment a particular agency or particular public servant when they experience a positive interpersonal encounter with a public servant. The goal of citizen satisfaction is met by maintaining a work environment that rewards positive exchanges between citizens and the state. This requires workers who are capable, experienced, and motivated to perform and who

take pride in their work and leaders who recognize and champion this cause. Working in public service requires employees who are skilled in the performance of emotional labor and affective delivery and leadership that recognizes, evaluates, rewards, and practices emotional labor effectively. Newman et al. (2009) connect emotional labor to the leadership discourse by examining the practice of emotional labor in the context of leadership theory and conclude that affective leadership is intrinsically associated with emotional labor. Affective leadership includes more elements than those addressed by trait theorists (Van Wart 2003) including charisma, empathy, intuition, and emotional control. Affective leadership is fundamental to successful job performance. Leadership continues to be cited as the weakest link in public service, resulting in poor agency performance and low employee morale (Kramer 2008). As Alvin Toffler observed, a style of leadership that worked in the past may not work in the present, much less the future. Van Wart (2003) notes that early, instrumental views on leadership and particularly views on administrative leadership were influenced by scientific management theory. Just as production and management progressed from the Industrial Revolution to the age of technology, "there must be a leadership revolution" (Parker and Begnaud 2004, p. 2). Similarly, Bennis (2000) urges scholars to "rethink our most basic concepts of leadership" (2000, p. 170). The preoccupation with traits and behaviors – the transactional approach – ignores the important role of emotions in organizations and "can lead to theory and research that portrays organization members as cognitive stick figures whose behavior is unaffected by emotions" (Mowday and Sutton 1993, p. 197). The era of leadership as stewardship described by Van Wart (2003) introduced the important role of subordinates, who have become a major component in the analysis of leadership (Poppa 2005, p. 28). Emotional labor and affective leadership together further our understanding of leadership in the current era of multifaceted theory (Van Wart 2003). The work of government is interpersonal, with all of the intersubjectivities that this entails, where "daily experiences often unfold as a series of performance episodes" (Beal et al. 2006, p. 1054). Leadership theory that overlooks the role of emotion in organizations and affective interpersonal interactions lacks meaning in modern public administration: "If we want public administration scholarship capable of speaking truth to power, it must speak language that is meaningful" (Guy 2003, p. 652). Emotional labor is fundamental to effective public service. It animates knowledge work in interpersonal transactions and affective leadership facilitates effective emotional labor throughout the organization: "When people are treated as numbered units, interchangeable parts of no interest or value in themselves, empathy is sacrificed in the name of efficiency and cost-effectiveness" (Goleman 2006, p. 252). Emotional competence varies with the individual, and affective leaders recognize this for the purpose of maximizing organizational effectiveness and facilitating rewarding public service. At high skill levels, affective leadership prepares the worker to negotiate through considerable complexity and to make a reasoned response. Less-skilled workers who do not benefit from affective leaders make inappropriate responses or responses that fail to facilitate the interaction. Emotion work is learned, and affective leaders facilitate learning.

Studies comparing exemplary leaders with mediocre ones have found that the competencies that distinguish the best from the worst in human services have little to do with technical knowledge or skill, and "everything to do with social and emotional intelligence . . . What distinguishes leaders . . . goes far beyond that knowledge, into interpersonal skills like empathy, conflict resolution, and people development" (Goleman 2006, p. 261). Best practice leaders "encourage the heart. They listen carefully for quiet whisperings in dark corners. They attend to the subtle cues. They sniff the air to get the scent. They watch the faces" (Kouzes and Posner 1987, p. 115). Compassionate public service needs caring leaders, ones who can give subordinates "the sense of a safe emotional base to work from" and who can "communicate with people at an emotional level" (Lau 2000, p. 59). Connectivity and relationship building are key characteristics to affective leadership, as are developing rapport and emotional

engagement: "The best bosses are people who are trustworthy, emphatic and connected, who make us feel calm, appreciated, and inspired" (Goleman 2006, p. 277). "'Feeling connected' . . . refers not to some value niceness but to concrete emotional links between [leader and worker] . . . One powerful method to foster such links is to build . . . the sort of attuned relationship between [them]" (Goleman 2006, p. 282). Affective leadership sets the emotional tone that flows through their organizations, which, in turn, has consequences for how well collective objectives are met. Leaders need to nurture "social wisdom" or the qualities that allow the people we connect with in the workplace to flourish (Goleman 2006, p. 315). For Denhardt and Denhardt (2006), leadership is deeply rooted in the human psyche and requires considerable inner resources required by the leader. Ilgen and Klein (1989) argue that the absence of emotional labor or consideration of emotions in organizations is partly attributable to a historical preference in the organizational literature for cognitive constructs, which is reflected in leadership theory. Sy et al. (2005) observe changes to leadership theory, such that "affect is receiving increasing attention in the study of leadership" (2005, p. 304). This is echoed by Fairholm (2004) who notes that selected areas of public service scholarship "mixes the efficiency and productivity mantra of scientific management with the relationship, teamwork, values, and empowerment vocabulary of recent leadership literature, such as that found in the values-based leadership and emotional intelligence literature" (2004, p. 582). A fundamental challenge facing administrative leaders is not to make their work more efficient but to make it more humane and caring (Stivers 2008). Affective leadership, and recognizing the centrality of emotional labor, is the way in which this is addressed.

## Feminist Leadership

Like ethical leadership and affective leadership, feminist leadership lies within the category of multifaceted leadership theory by expanding the concept of leadership beyond traits or behaviors to include context. As such, this approach characterizes "leadership as a holistic product of socially-defined settings, common aims, discursive meanings, and individual perceptions, beliefs, and values" (Rusaw 2005, p. 385). Akin to Creswell's (2014) transformative research design, a model of feminist leadership takes a normative stance and rejects strictly "legal-rational conceptions of organization and the role of leader-manager neutrality in political relationships" (Rusaw 2005, p. 385). Feminist leadership facilitates participation across a wide range of different stakeholders, particularly those lacking voice or who tend to be at the margins of political decision making, and serves as a catalyst to give voice and coproduce solutions with those affected by social, economic, and political inequalities. Rusaw reveals five dimensions of feminist leadership (2005, pp. 388–389):

1. **Relating and creating knowledge**: Feminist leadership emphasizes interpersonal relationships and recognizes the different ways men and women learn social roles and create new knowledge.
2. **Commitment to care**: Feminist leaders are concerned with the quality of compassion and social responsibilities in their organizations, not just efficiencies.
3. **Standpoint theory**: Feminist leadership acknowledges different perspectives based on individuals' lived experiences and seeks to incorporate marginalized voices.
4. **Critiquing dominant structures**: Feminist leadership does not reproduce dominant organizational power structures due to discrimination, alienating bureaucracy, or institutional injustices.
5. **Pluralism**: Feminist leadership is not hierarchical nor defined in terms of job title.

New Public Management reforms have had the effects of reifying quantitative performance measures and undervaluing caring labor, both of which are particularly fundamental to effective and equitable public service: "Education, medical care, social work, and many other services have both a technical, tangible component and a care

component. Both are necessary for successful outcomes" (Leuenberger 2005, p. 403). The parallels with affective leadership and ethical leadership are clear: "Focus on market efficiency exclusively has led to social and economic problems such as purchaser/provider split, corrosion of public service capital, and inequity in service provision and availability … and has replaced it with dehumanized, mechanical efforts" (Lueuenberger 2005, p. 402). Reorienting organizational mission and implementing a feminist leadership approach can undermine dehumanizing reform trends.

## Discussion

Exciting areas for future research include leadership and culture or cross-national comparisons of public sector leadership (Berman et al. 2013; Orazi et al. 2013), spirituality and leadership (Fairholm 2004; Giacalone and Jurkiewicz 2003), and leading regardless of one's position in the hierarchy or leading in place (O'Leary 2013; Rusaw 2005). Leading in place means that "power emanates *from consensus* rather than from being the means for achieving consensus" (Rusaw 2005, p. 389, emphasis supplied). Along with the evolution of leadership theory to include multiple facets of leaders and leading, so too must leadership theory address society in order to be useful to a new generation of administrative leaders: "Public administrators bring a values perspective to the work they do and recognize their potentially influential place in society … moving to higher-order perspectives increases a public administrator's capacity to cope with increasingly complex issues, organizations, and relationships" (Fairholm 2004, p. 586). Narrow definitions of leadership that fail to account for complexity consequently fail to prepare public administrators for their roles as leaders in society.

# Leadership and Technology

Jeannie Pridmore[1] and John Overocker[2]
[1]University of West Georgia, Carrollton, GA, USA
[2]Carroll County Public Defender, Carrollton, GA, USA

## Synonyms

Governance; Privacy policy

## Definition

Information technology: Is the application of computers to store, retrieve, transmit, and manipulate data.

Leadership: The activity of leading a group of people or an organization.

## Introduction

In the digital world of big data, nothing could be more important than information privacy and security. Having effective leadership in this area is key to ensuring that appropriate strategies, priorities, policies, and processes are successfully designed, implemented, and embedded to maximize innovation and minimize the risks arising from the use of information technology (IT). Given recent controversies such as Eric Snowden and the battle between Apple and the FBI, privacy advocates warn that we might be "sleepwalking into a surveillance society" (Greenwald 2013).

IT has enabled the rise of big data. As technology continues to advance especially in the areas of wearable and smart mobile devices, personal information is being captured, stored, shared, and even stolen at levels that have never before been experienced (Thierer 2015). Everyday attacks are conducted to obtain and exploit information by criminals and governments worldwide.

IT and big data hold tremendous potential benefits from improving safety and physical security to personal benefits such as individualized healthcare treatment and fraud detection. However, the concerns over data privacy and personal security are very real. While many may feel that as long as someone is not doing anything wrong, why should anyone care if others see what is being done. Is it wrong to take a shower, or is it wrong to visit a website on human rights? Is it wrong to not want every aspect of daily life tracked, stored, and possibly used against them?

It's easy to say personal privacy is not as important as preventing crimes, but having leaders who fully understand the critical importance of data privacy and security and finding the needed balance between privacy and the needs for big data analysis may be the biggest challenge of our time and one of the most important policy issues in the world today (Rubinstein 2013). This issue must be thoughtfully addressed by proactive leaders.

The expectation of privacy in the United States varies from place to place and from situation to situation. The right to privacy protects an individual's right to be protected from unreasonable or offensive intrusion into their private affairs and concerns. The method by which the courts determine government action as reasonable is under the protection of the Fourth Amendment. There is, to a certain extent, a debate as to whether a right to privacy exists in the United States (*see Griswold v. Connecticut*, 381 US 479 (1965) (*J. Black dissenting*)) in which Justice Black makes the case that there are no specific protections of a citizen's privacy only instances when privacy protection is a peripheral effect of the enforcement of other rights.

The emergence of the right to privacy is of fairly recent origins (Rubenfeld 1989). For the purposes of this brief, the authors take the view that a right to privacy does exist (*J. Goldberg concurring*). The right to privacy in the United States is far too broad a topic to be fully tackled in this brief. The brief will focus on the privacy in regard to IT in the twenty-first century.

## The Right to Privacy

The right to privacy in the United States protects physical privacy and other intrusions, such as the prevention of eavesdropping and prying into some personal records. Privacy concerns generally involve at least one of three groups:

1. Government
2. Private entities
3. Other individuals

The US Constitution is a limiting document on the government's power and does not protect individual's privacy from the invasion by private citizens or entities. This holds true even if the information or property is later handed over to the government, unless the third party was operating under government instruction.

The Fourth Amendment states "(t)he right of people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized." The Fourth Amendment protects against *unreasonable* search and seizure by the government.

A seizure occurs when the government takes possession of items or detains people. A search is any intrusion by the government into something in which one has a reasonable expectation of privacy. Though the Fourth Amendment protects individual privacy from the government, it is important to highlight the amount of data and transactions that occur online today means that the government or other entities can access and track massive amounts of personal data without any physical intrusion and without the individual ever being aware that they are being watched.

## Privacy and Information Technology

In 1999, Sun Microsystems' CEO Scott McNealy said, "You have zero privacy anyway. Get over it." (Sprenger 1999). The fact that personal information is now much more of a commodity (more sothan in 1890 or 1999, for that matter) means privacy rights might need to be examined more as individual property. In the first decade of thetwenty-first century, the number of people connected to the Internet increased from 350 million in 2001 to more than two billion in 2010 (Pridmore and Overocker 2016). By 2025, the majority of the world's population, the majority of eight billion people, will be connected to the Internet (Khan et al. 2014).

Currently there are over five billion individuals using smart mobile devices, and by 2020, it's estimated that 50 billion devices will be connected to the Internet and data production will be 44 times greater than in 2009 (Khan et al. 2014). These smart mobile devices mean that billions of people are enabling a very intimate form of personal surveillance. These devices go everywhere and can be used to not only track everything the owner does but also everyone around the owner.

These devices have added a tremendous amount of complexity to the right to privacy topic and are proving to be a substantial challenge for lawmakers to understand how new technologies (smart devices and data collection from their "free" services) can and should be used in keeping with the right to privacy. The Supreme Court has offered little guidance by distinguishing between technology that simply enhances an individual's senses and technology that creates new superhuman powers such as location tracking or backdoor encryption. For example, in *Katz*, it was recognized that new technologies can make a private space versus public space impossible to separate. However, failure to clearly explain concerns about new technology and arbitrary use of language has been confusing to the lower courts (Fairfield 2009).

To date, the courts have not reached a consensus on what constitutes a reasonable expectation of Internet privacy (Fairfield 2009). There are still questions as to whether there is a reasonable expectation of Internet privacy. When an individual engages in transactions on their smart device, they normally must first agree to the terms of the service provider. These agreements are typically referred to as end-user license agreements (EULA) and terms of service (TOS) or simply set out in lesser documents such as Code of Conduct and Reimbursement Policies (Lim 2008). Many criticize these contracts as being too one sided and argue for the courts to acknowledge traditional common law rights (Cifrino 2014).

Since the Fourth Amendment only applies to the government, the biggest concern for privacy of US citizens should be that of private organizations collecting, storing, and possibly selling personal data. However, when congress passed the Patriot Act, it gave the US government unprecedented authority to conduct surveillance. Since its passage, privacy intrusions and government overreach have been a concern. The Patriot Act increases the government's surveillance powers in the following areas ("The USA PATRIOT Act"):

1. It increases the government's ability to look at an individual's records being held by third parties (Section 215).
2. It increases the government's ability to search without notice private property (Section 213).
3. It widens a narrow exception to the Fourth Amendment that had been created for the collection of foreign intelligence information (Section 218).
4. It extends the Fourth Amendment exception for spying and gathering "addressing" information about the origin and destination of communications, as opposed to the content (Section 214).

Government officials continue to attest that these powers are only invoked on people of interest or individuals who are suspected of wrongdoing or are associated with known terrorists. Critics have raised concerns of possible overreach and unchecked government power to electronically track individuals with very little evidence. If the revelations of Eric Snowden are true, the ease with which the government tracks and stores personal data from the masses is staggering. Mr Snowden also leaked that the US government had worked with major organizations such as Apple, Microsoft, and Google, to influence their encryption techniques and essentially create a backdoor into their technology.

Since then, many organizations have tried to distance themselves from government involvement (Greenwald and MacAskill 2013), thus leading to the Apple versus FBI case of 2016, with Apple refusing to create a backdoor for the government to unlock an iPhone. Apple's stance is that if they did what the government wanted, it would ultimately make all iPhones vulnerable to being hacked. Allowing the government to have backdoors into IT puts everyone at risk for privacy breaches, not just known criminals or people of interest.

## The Future of Privacy Policy and Information Technology

It's important to note that most people do understand many of the privacy risks associated with using IT. However, people have fallen in love with the online world and their smart devices. Users of technology accept that they are giving their

personal data away in exchange for the convenience of the systems they use. Some might argue that anyone who has a problem with their personal data being known should simply choose to not use technology in their daily life. However, this is not a reasonable suggestion. It puts all of the reasonability on the user, and none on those who are collecting the data.

Privacy policies are needed for governments and corporations alike. Going forward leaders and policy makers are needed who can fully understand these issues and who can enact IT privacy policies that make sense. Regulation for the sack of regulation is not needed. Leaders are needed who are able to weigh the benefits of data collection against the harms that it could cause. Privacy policies are needed to help minimize potential harm that can come for privacy breaches, and they need to address the personal data generated by the user, access to their smart devices themselves, and access to other smart devices near them. Based on the Fair Information Practice Principles (FIPPs), the following tenets need to be studied, considered, and implemented (Gellman 2014):

1. Individual Control of Data
2. Transparency of Data Collection and Use
3. Respect for Context of Data
4. Security of Data
5. Access to Data
6. Focused Data Collection instead of Mass Collection
7. Accountability for the Data Collected

Probably the two biggest reasons for a lack of privacy policy and IT are a lack of leaders who fully understand these issues and the difficulty of how to translate these principles into legally enforceable regulations. Each of the items above could be interpreted several different ways. In addition, privacy policies will have to be developed gradually and grow organically as technology changes.

## Conclusion

Future debate and research is critical for the field of privacy and IT. This debate needs to happen now not only from a US perspective but also as a global concern. Technology is advancing so fast. It is important to begin this process today if there is any hope in being able to keep up with new technology as it is introduced. Secondly, with the global rise of the Internet population from developing countries, there is a projected flood of users that may not share the same concept of privacy as most "Western" users because of cultural and legal differences. Without established policies in place, this large influx of new users who may not be concerned or share the same concept of privacy could detrimentally impact the right to privacy on the Internet.

# Leadership Behavior for Successful Change Management

Hamid Mahmood Gelaidan[1], Abdullah Al-Swidi[1] and Hashed Ahmed Mabkhot[2]

[1]Department of Management and Marketing, College of Business and Economics, Qatar University, Doha, Qatar

[2]School of Business Management, College of Business, Universiti Utara Malaysia, Sintok, Kedah, Malaysia

## Synonyms

Business process reengineering; Organizational development; Organizational excellences

## Definition

Successful change management is the effective leadership of the organizational development initiatives and the business process reengineering efforts to achieve excellence organizational business results.

## Introduction

To keep pace with the current changing and challenging business environment, organizational change has become an integral part of the organizational life cycle. Due to internal and external factors such as globalization, business change, the changing global economy, and massive technological advancements, organizations are forced to respond effectively to survive and grow in the marketplace. To survive, grow, and remain competitive, organizations continually attempt to make changes (Battilana et al. 2010). However, not all change initiatives are effective – 70% of all major changes fail (Vakola 2014). It has been argued that some change initiatives fail due to the lack of strategy and vision, lack of management commitment and support, lack of trust, ineffective communication plans, lack of change management skills, and strong resistance to change (Vakola et al. 2004).

In the context of higher education, due to factors such as the lack of funding, increasing student numbers, growing competition, changing teaching and learning mechanisms, and technological advancements, this sector has undergone major changes. Therefore, universities have had to embrace such changes proactively to remain relevant (By et al. 2008). Similarly, Malaysian higher education institutions have been working hard to achieve local and international recognition by following global academic trends and introducing various changes. The introduction of these changes created challenges, and organizations failed to implement changes fully due to several factors. The main factor is people and their perceptions of the changes introduced by the universities, and in this case, Kurt Lewin's (1951) three-stage theory applies. The theory emphasizes people's readiness for change through the creation of a sense of urgency. Therefore, to achieve a high level of satisfaction in an organization, the organization may need to cultivate the emotional intelligence of its employees to break down the inherent resistance to change.

Despite the growing importance of change management, Dalton and Gottlieb (2003) and Mrayyan et al. (2008) have highlighted the lack of research on this topic. Similarly, Dasborough et al. (2015) have argued that emotional responses to organizational change are still largely ignored in the literature. However, factors such as organizational commitment, emotional intelligence, and leadership behavior are expected to have a great influence on employees' readiness for change in all types of organizations in general and in the Malaysian

higher education context in particular (Nordin 2011). Therefore, this study attempted to contribute to the literature by investigating the joint effects of leadership behavior and emotional intelligence on organizational readiness for change at different levels of organizational commitment.

## Change Management Model: Kurt Lewin's Three-Step Model

The main theory for the current study is the Kurt Lewin's Three-Step Model (Lewin 1951) which is based on the premise of three-stage process. The first stage is unfreezing which is important for the other two stages to undergo with people making effective change. Lewin believed that the stability of the human behavior is an important factor that helps bring about successful change. The second stage of Lewin's theory is movement or change, which can be linked to different outcomes in the form of behaviors, values, attitudes, structures, or processes. This notion is reinforced by previous studies (Cummings and Worley 2001). The third stage of Lewin's model is refreezing which is important for the change's sustainability. It works for the stability of the group equilibrium and guarantees that new behaviors are not open to regression.

## Leadership Behavior and Organizational Readiness for Change

The study of change management is necessary especially at the moment due to the fast-paced technology and continuously increasing the people required. Same with other area in business management field or any other area, many theories have discussed the change management phenomena and argued how the individual or group can support the change. The review of the related theories and their contribution to the current research is discussed. Herold et al. (2008) argued that if an organization does not carry out daily change, it would not be able to maintain its position in the marketplace. Thus, change is essential for maintaining organizational validity and accessibility. Martins (2008) supported this view and indicated that change has turned out to be a significant obstacle not only on the organizational level but also on the individual level, including for leaders. Furthermore, a thorough review of past research shows that the focus in organizational change research has been on organizational factors, while individual factors such as readiness for change have been greatly neglected (Vakola et al. 2004).

Therefore, organizational readiness for change is usually accompanied by introducing change gradually as described by Kurt Lewin's Three-Step Model (Mrayyan et al. 2008). They defined organizational readiness for change as a person's or an organization's subjective feelings or perceived ability regarding change readiness. They stated that "readiness" is a process of becoming ready and that the outcomes relate to readiness for change. Leadership plays an important role in every organizational change. Erkutlu (2008) and Gelaidan and Ahmed (2013b) agreed, suggesting that leadership behavior directly affects employees' results. Numerous studies emphasize the classification of the features and significance of transformational and transactional leadership styles (Avolio et al. 1999). According to Bass (1985), the transactional leadership style involves leaders exchanging rewards for followers' positive performance. In contrast, transformational leadership involves leaders making sacrifices for their followers and surpasses the transactional style. These sacrifices relate to how leaders motivate their followers to work to achieve their performance targets. Therefore, producing various positive outcomes in organizational scenarios requires transformational leadership behaviors (Kiyani et al. 2013; Leban and Zulauf 2004).

In line with this, leadership is a crucial factor in enhancing followers' attitudes toward the development or achievement of organizations' objectives. Therefore, as is expected and has been proven, leadership behavior can direct and determine employees' attitudes toward organizations' performance, for example, by preparing employees for change and inspiring them to feel committed. In addition, researchers who have dedicated their work to change management consider trust in management a required prerequisite

for minimizing workers' resistance to change (Vakola 2014); this is reflected in studies conducted by Coyle-Shapiro and Morrow (2003), Cunningham et al. (2002), and Kiefer (2005). Moreover, when workers, who are the recipients of change, consider their leader capable of dealing with change as well as trustworthy and supportive, and when they believe their leader respects them, they are more inclined to support change (Martin 1998; Wanberg and Banas 2000). Although leadership has been proven to have a theoretical relevance in change management, few empirical works have examined the relationship between leadership behavior and employee readiness for change (Gelaidan and Ahmed 2013a).

## Emotional Intelligence and Organizational Readiness for Change

The introduction of the term emotional intelligence (EI) dated back to the 1990s. Salovey and Mayer (1990) were the pioneers to introduce the name "emotional intelligence" to describe the peoples' control of their emotions. In their paper, the emotional intelligence was defined to be the ability to monitor feelings and emotion of yourself and others and to use this information to guide your actions and behaviors. This definition was recently adopted by Golman (1995) and further categorized the emotional intelligence into self-awareness, managing emotions, motivating oneself, empathy, and handling relationships.

The current study adopted the definition of EI as provided by (Mayer et al. 1997) as the skills and abilities to perceive and appraise accurately and understand the emotions and emotional knowledge, the ability to generate feelings when to facilitate thought, and the ability to understand emotion and emotional knowledge. It is also the ability of the individual to regulate emotions to promote emotional and intellectual growth.

According to prior studies, employee attitudes and behaviors should be developed to introduce the required change in the organization (Armenakis et al. 1993; Bernerth 2004). Based on the literature, individuals are the main unit of analysis in the investigation of successful organizational change programs (Judge et al. 1999). Hence, prior to implementing change programs, it is crucial for management to determine employees' views of change. Salovey and Mayer (1990) stated that emotional intelligence is the individual's capability to express and perceive emotion and to understand emotional knowledge. Moreover, Coetzee and Harry (2013) stressed that it is important for people to develop their emotional intelligence skills, as these skills can strengthen their profession ability. Emotional intelligence not only provides performance itself but also provides potential for performance, and using this potential is a matter of personal choice (Jain and Singh 2012).

Change causes intense emotions that can influence change implementation (Daus et al. 2012). Therefore, attention recently has shifted to emotions experienced during organizational changes. Dasborough et al. (2015) noted that, in the context of universities, it is especially important to focus on the emotional aspects linked to change implementation. Thus, in addition to identifying how employees' perceptions spark emotional reactions to change, in this study, this study also attempted to examine people's emotions before and after changes take place, as recommended by Dasborough et al. (2015). Furthermore, a study by Seo et al. (2012) revealed that positive and negative emotions are related to commitment, resistance, and change support. Thus, this study attempted to investigate the holistic emotional experience of change use methods that enable complex emotions to arise and to examine the dynamic aspects of emotions in the long term.

## Does Employees' Commitment Make a Difference?

Organizational commitment was defined by Porter et al. (1974) as the combined strength of an individual's identification with and participation in specific organizational activities. Furthermore, they divided organizational commitment into two concepts, namely, behavior and attitude, and asserted that commitment is a feeling of obligation characterized by exerting effort toward achieving organizational goals. However, Martins (2008) viewed

organizational commitment as a more active and positive attitude toward the organization.

Moreover, it was argued by J.P. Meyer and Allen (1997) that an organization can be successful in the change process if employees are highly committed. They claimed that commitment and obligation are greatest once they are based on belief in the importance of the change, because then employees simply want to see the change implemented successfully. In addition, John P. Meyer and Allen (1991) indicated that organizational commitment consists of three components, namely, affective, continuance, and normative commitment, and argued that employees can be involved in all types of commitment to varying degrees. Furthermore, J.P. Meyer and Allen (1997) asserted that commitment, demonstration of emotional attachment, and identification with employees will bring about high employee involvement in the organization.

## Conclusions

This study was an attempt to examine factors influencing individuals' readiness for organizational change. The results show that leadership behavior and emotional intelligence have positive effects on employees' readiness for change. Emotionally intelligent employees with effective leaders are more likely to be open to change. In addition, the effects of leadership behavior and emotional intelligence on employees' readiness for change are strong in both low and high levels of organizational commitment. These findings have several implications. First, it would be invaluable for organizations planning or undergoing change to develop a high readiness state by assessing managers and change agents for their change readiness. Second, it is crucial for organizations to encourage and promote employee readiness for change through adopting the appropriate leadership style that facilitates proper communication channels between employees and leaders. This level of communication should engage employees and ensure their participation in planning and implementing changes. To better explain the existing gap, future research is suggested to investigate the effects of various other factors such as training, motivation, culture, and recognition. In addition, research focus should be on investigating the link between readiness for change and successful change implementation initiatives.

In summary, this study emphasizes the importance of individual readiness for change regarding any successful organizational change. If employees lack change readiness, change implementation is likely to be unsuccessful. Thus, in light of the outcomes of this study, managers handling disruptive change are encouraged to consider the identification, assessment, and enhancement of individual readiness for change while keeping in mind the key factors for successful change implementation.

# Leadership Challenges in Civic Engagement

Chris McInerney and Cian Finn
Department of Politics and Public Administration, University of Limerick, Limerick, Ireland

## Introduction

This chapter examines the multiple challenges posed to public administration by contemporary approaches to civic engagement. Civic engagement and public participation are relatively ambiguous terms conceptually and politically.

This is evident from the proliferation of terms used to describe a practice which includes, among others, public engagement, citizen engagement, civic engagement, public participation, citizen participation, community participation, public deliberation, deliberative democracy, network governance, empowered participatory governance, and collaborative governance (Nabatchi and Amsler 2014). For ease of understanding, engagement and participation can be considered umbrella terms for the numerous methods afforded to the public to engage in governance and to influence decisions of importance to their lives and to wider society and which go beyond traditional forms of political participation.

Civic engagement takes institutional and non-institutional forms. Institutional engagement takes place in formal participatory mechanisms or processes which exist within and alongside existing representative and bureaucratic institutions (-Warren 2009). These institutions are sometimes understood as so-called upstream or quasi-legislative processes used to create, shape, and implement policy (Nabatchi and Amsler 2014). Noninstitutional engagement by contrast is often ad hoc, informal, and within existing networks. It may well respond to short-term needs and operate with minimal structure and bureaucracy.

Any focus on civic engagement cannot be disconnected from understandings of the broader concept of "governance." Described by Pierre and Peters as a "notoriously slippery concept," governance is subject to a number of diverse academic and practitioner definitions (Pierre and Peters 2000). However, from these definitions, some shared themes are evident: a recognition of changing contexts and roles, concern with coordination between state and non-state actors, achieving new means of inducing collective action, recognition of autonomous capacity outside of the institutions of the state, and the design in some cases at least of new institutions to accommodate governance practices.

The shift from government to governance has helped stimulate a renewed and/or increased interest in civic engagement, public participation, and deeper democracy, though the concept of citizen participation predates the current popularity of governance. Hence, public officials find themselves required to better inform, consult, and collaborate with citizens particularly in the delivery of public services. Supranational organizations such as the World Bank and the European Union promote and encourage the active involvement of citizens in local decision-making and endorse engagement as a central component of good governance.

## Civic Engagement: Why Should Public Administration Be Concerned?

The growing interest in civic engagement comes in response to perceived democratic deficits and declining citizen trust in politics and public administration. In the traditional model of democracy, citizens elect representatives who, in conjunction with public administration, form and implement policy on their behalf. This system is not always responsive to the preferences and needs of citizens or capable of producing public policy or outcomes that address complex and/or wicked issues (Warren 2009). Engagement therefore has the potential to deepen democracy through increasing the active involvement of citizens in governance, extending the surface area of the state, and improving state performance and political outcomes. By increasing the participation of otherwise marginalized groups, it becomes possible to produce more just and inclusive public policies thereby increasing the legitimacy of and trust in public administration.

Despite extensive engagement experiences, few models of exemplary civic engagement have been produced. Indeed, evidence suggests that distrust and tension between citizens and public administration are common, often as a result of isolation from decision-making and from a mismatch of values, aspiration, and expectation (Morse 2008). Participation, as currently facilitated and institutionalized, has largely failed to fulfill its democratizing and decision-making potential not least because of limited scrutiny on the relationship between public administration

and civic engagement. Much of the focus within the civic engagement literature and practice is on the perceived importance of institutional design and the capacity, competence, and motivations of public participants and less on the role of public administration and the attributes, skills, and disposition of leaders within it.

Recurring weaknesses in civic engagement include: inadequacy of attention to approach, structures, roles, processes, methods, and resources; reliance on formalized structures such as fixed agendas, predetermined outcomes, restricted discussion, speedy decision-making, and the excessive use of technical language; an absence of genuine commitment to community involvement by officials; an excessive and unbalanced burden of expectations placed upon community representatives in terms of representation and accountability; inadequate recognition of diversity within communities; limited effort to monitor and evaluate and inadequate funding for community engagement processes.

## Enabling Civic Engagement

Having established that civic engagement is a core but underperforming element of mainstream governance, we now turn to the specific role of public administration and public leadership.

Taking the role of public administration first, it is clear that promoting good-quality, effective, and efficacious civic engagement requires robust institutions or processes of engagement. In practice, in the world of civic engagement, these are often facilitated and operated by public administration. In brief, public officials will often:

i. Design and define the frameworks within which civic engagement occurs. While politicians and/or officials may determine whether or at what level civic engagement may happen, invariably it is public officials who have a major role in shaping the mechanics of engagement.
ii. Operate the civic engagement machinery. In most cases public administration provides the ongoing, regular interface between the state and civil society and individual citizen participants. Officials are most often on the frontline of civic engagement and are expected to provide the operational capacity necessary to enable, facilitate, or indeed manage and control a variety of inputs into public policy processes.
iii. Determine who to engage with. In more formally structured civic engagement processes, officials often set the criteria for who should or should not be invited or involved, essentially determining the membership of the public policy "authorizing environment" (Moore 1995). Less fully explored or facilitated is the existence of distinct organizational spaces and mechanisms to draw and enable representation for marginalized and those underrepresented in traditional democratic arenas.
iv. Decide who is listened to and who is heard. While engagement affords the opportunity to participate, there is no guarantee that the opinions of all participants will be equally valued and listened to. Public administration must deal with a greater number of stakeholders and balance the demands of multiple actors.
v. Determine how different groups are listened to, either in highly formalized and rigid processes within fixed and inflexible rules and with predetermined outcomes or in more open, deliberative spaces where there is a real chance of influencing outcomes. In dealing with inexperienced actors not yet accustomed to active involvement in governance, officials may have to be proactive and creative in maximizing their participation. Officials may also be challenged to ensure equal opportunity to give voice to as well as respect different forms of speaking and reasoning.
vi. Allocate and/or withdraw resources. Officials may occupy multiple and potentially conflicting roles, on one hand determining the allocation of resources to non-state actors and on the other engaging with them in their role as policy advocates. Where resource allocation and civic engagement responsibilities

rest with the same public entity, the dangers of coercion, co-option, or conflict may be present.

vii. Manage and mediate access to/from/between actors in policy processes, putting them in a powerful but sometimes criticized position due to the suggested negative implication for the traditional dichotomy between politics and public administration.

These roles are performed by public administration systems all over the world. Public officials are now considered more active in the policy process due to their enhanced role in organizing and administering networks and producing and designing institutions of engagement. Engagement necessitates joint problem solving and closer interaction between citizens and officials at the policy interface. The relationship between the public and public administration is increasingly presented as one of partnership and collaboration in which engagement is understood as a form of bureaucratic responsiveness to citizens and civil society and where public participation adds at least some capacity to enhance the trust between citizens and public administration (Bryer 2007).

However, participation alters the traditional role of the administrator as "expert, implementer, and ruler" and the citizen as "client, voter, and customer" (Callahan 2007). The creation of participatory spaces and the institutionalization of formal collaboration between citizens and elites involve the tacit assumption of the need for officials to alter their legal-rational bureaucratic ethics and traditional roles (Bryer 2007). The hierarchical and bureaucratic nature of public administration laid down in traditional theories of public administration appears to be at odds with more sustained collaboration between officials, citizens, and civil society as is required within New Public Governance/public value approaches (Denhardt and Denhardt 2015; Moore 1995). Moreover, highly bureaucratic and hierarchical modes of organization are not best suited to respond to non-routine activities that require innovation or creativity (Cooke and Muir 2012; Mulgan 2012). Equally, questions persist about the capacity of New Public Management frameworks to engage substantively with members of the public as democratic citizens as opposed to clients or customers of public services.

It can be argued therefore that participatory democracy is incompatible with the traditional rules-based ethos of public administration. Instead, participation requires public administration to evolve from an exclusive ethos of bureaucracy to an ethos or logic of participation and democracy. In this regard the distinction between a bureaucratic ethos and a democratic ethos within public administration is illuminating. With a bureaucratic ethos, the core values include: accountability, competency, economy, impartiality, predictability, and trustworthiness. By contrast, in the democratic ethos, associated with the New Public Administration movement, values such as advocacy, compassion, confidentiality, individual rights, political awareness, and the public interest are considered important alongside the smooth running of bureaucracy. Ongoing and meaningful citizen participation, directly and through civil society organizations, is an important element of the democratic process.

Clearly, problems arise when adherents to a bureaucratic ethos simply but subtly refuse to accept the democratic legitimacy of citizen participation and civic engagement and may explicitly or more passively resist participatory processes. Issues of belief, disposition, and values emerge as key factors in determining a possible transition to a more citizen-oriented public administration.

It is in such circumstances that a focused public leadership for civic engagement assumes greater importance.

## Building Capacity for Public Leadership

To increase the effectiveness of civic engagement and satisfaction with its outcomes from the perspectives of all participants leadership within public administration is of paramount importance.

For civic engagement to move beyond the rhetorical and the cosmetic, leadership from within public administration is a fundamental

requirement. Successful engagement requires a champion or set of champions in government, civil society, or, as is the concern here, in public administration. Capacity building within public administration however has been largely opportunistic, unsystematic, and frequently focused on the bureaucratic and instrumental, reflecting much of the preoccupations of public sector capacity building on technical, instrumental objectives. More generally it is suggested that there has been inadequate attention paid to public leadership within the field of public administration and within public administration scholarship (Kellis and Ran 2012; Morse 2008). At the same time, citizen/civil society capacity and knowledge is increasing, as is citizen demand for involvement in decision-making. As a result leaders within public administration are challenged to adjust how they facilitate and enable greater citizen voice and influence. A number of elements are central to this.

## Locating Leadership and Leadership Training Within an Appropriate Public Administration Paradigm

In practice, the dominant public administration paradigms and associated models of public leadership continue to be based on the bureaucratic values of traditional public administration and on the now questioned, market-oriented values of New Public Management (NPM) (Farazmand 2012). This has led some to suggest that rather than operating in an era of New Public Governance, what we see is simply NPM with a governance face. Whether or not the demise of NPM is as profound as some suggest, there is little widespread evidence to demonstrate that leadership orientations within public administration have evolved to accommodate a more democratic ethos. Nor does it reach the heights expected of New Public Leadership and its contrast between management as an exercise in coping with tame problems and leadership as a practice of tackling and coping with complex and dynamic wicked problems (Brooks and Grint 2010).

It is perhaps not surprising, therefore, that of the three "environments" in Moore's original public value framework – task, the authorizing environment, and operational capacity – it is operational capacity and associated questions of institutional design that are frequently the least developed (Shaw 2012). In short, the paradigmatic drivers of operational capacity, including leadership capacity, continue to emphasize the instrumental: training for individual bureaucrats, improving administrative systems, organizational strengthening, decentering service delivery, reducing the size of the state, and some degree of emphasis on increased political accountability. From a civic engagement, perspective leadership capacity to emerge new forms of operational and leadership styles are required.

## Engendering Appropriate Leadership Styles

While the practical focus of leadership in public administration remains dominated by the instrumental, there has been considerable development of academic models of leadership with capacity to more fully embrace a civic engagement ethos. Early distinctions were drawn between more instrumental, transactional forms of leadership designed to maintain stability and continuity and transformative leadership with a capacity to more effectively stimulate and manage change. Other leadership styles have emphasized interpersonal leadership, entrepreneurial approaches, network governance leadership, integrative leadership, and collaborative leadership. While all of these have implications for civic engagement potential and network governance, integrative and collaborative styles of leadership place greater emphasis on collaboration, communication, and cooperation. In brief, they emphasize, to greater or lesser degree, working across boundaries, facilitation, consensus building, self-awareness, civic capacity, trust building, partnership, mutual learning, appropriate mind-set, risk taking, and passion.

The challenge to develop such capacity among individual leaders is not inconsiderable and

involves a number of distinct components variously described as attributes, skills, behaviors, knowledge or cognitive development, disposition, mind-set, or psychological transformation (Morse 2008; Schachter and Aliaga 2004). Clearly, the ability to build all of these elements into formulaic leadership training programs is likely to be crowded out by a narrower emphasis on attributes associated with value for money, efficiency, and effectiveness. This underscores the need to add alternative approaches to their delivery, including workplace training; frontline placements, including within civil society organizations; knowledge exchange forums; and experiential and problem-based learning. Crucially though, the emphasis must be placed on starting from the "inside out" thereby by ensuring that command and control impulses can be adjusted to enable meaningful engagement (Morse 2008).

## Conclusion

In conclusion, the not inconsiderable leadership challenges for civic engagement could be summed up as including:

- To more fully conceive of governance, public participation, and civic engagement as opportunities for authentic, integrated collaborative exercises, with the potential to produce better policy and democratic outcomes
- To confront the non-authentic, rhetorical adherence to principles of civic engagement and their dilution by control and command-centered administered regime
- To embed and legitimize, both politically and administratively, a democratic ethos within public administration systems upon which more meaningful leadership for civic engagement can be built
- To develop the ability of public leaders to see the value added of civic engagement over a longer time horizon and to gain the necessary characteristics to actualize and operationalize its potential
- To adjust leadership training programs, including MPA programs, to move beyond the technical and more instrumental focus that has dominated for many years to embrace authentic, transformative, and collaborative leadership opportunities

## Definitions

**Leadership competencies:** Know-how, skills, experiences, and values all put together – under the meta category of competencies (Roberts 1997) – enable an individual to work effectively. Lawler (1994, p. 4) comments about competency-based organizations as, "...organizational systems in which the capabilities of the individuals are the primary focus and which cause them to be managed in a way that provides competitive advantage." Leadership positions are a complex job requiring consensus building and/or balancing competing demands of stakeholders which requires a unique combination of knowledge, skills, attitudes, and behavior, enabling a leader to deliver seamlessly toward an organization's rationale.

## Introduction

In a world of increasing digitization and external communications, a democratic government's demands from public administrators for both effective and efficient administration have increased substantially. In the process, most generalist public administrators have to continuously adapt to such changing times by learning and managing new age activities such as artificial intelligence (AI), cyber security, data governance, and social media management. These are new knowledge frontiers beyond their comfort zones of traditional law and order and day-to-day government functioning.

In the Indian context, the Indian Administrative Service (IAS) is considered a coveted jewel in the crown of public administration. IAS has been commonly referred to as the "steel frame" of the erstwhile British territorial rule. For administrative ease, each Indian state is subdivided into 700+ districts, having an average population of about two million. An IAS officer designated as the District Collector or District Magistrate (DM) is given the responsibility to lead each of these districts. The DM is responsible for supervising and executing all development schemes proposed by both the central and state governments within their respective district (Kakani and Marathe 2018). Further, the job of an IAS is prone to job rotation. They are entrusted with a wide range of responsibilities, including law enforcement, polling, and/or any disaster response to the district administration.

IAS officers are recruited either through the direct recruitment process conducted by the Union Public Service Commission (UPSC) or through promotions from the state cadre. Direct recruitment is done through a highly competitive and rigorous entrance examination in which, out of about 1.8 million applicants, only 150–200 are selected. Scholars often refer to these bureaucrats as a case of bright and good people caught in a bad system (Saxena 2010). After selection, these "probationary" officers undergo a rigorous 2-year training at India's premier public administration institute, the Lal Bahadur Shastri National Academy of Administration (LBSNAA). This training is a combination of classroom and on-the-job training of about a year under a mentor DM.

The coveted leadership position of a "DM" often comes at a young age (about 25–37 years of age), having various tasks in hand, in a complex

environment, and is thereby often under stress to deliver quality services with optimum resources. Their knowledge, skills, attitudes, and behavior enable them to work both efficiently and effectively, and these are their competencies (Lawler 1994).

This competency-based framework is more suited for administrators these days as it is more malleable. Thus, administrators in both public sector and private sector alike have been migrating to becoming competency-based organizations.

It is important to note that there is no common set of competencies identified for the public administrators. Moreover, contextual variations have been observed in the critical competencies which are likely to lead to effective performance of the public administrators (see Virtanen 2000). Thus, this entry specifically aims to present the essential competencies for the IAS officers to enable them to discharge their duties effectively as District Magistrates. It is important to understand these specific competencies as the state traditions of Indian public administration context are different and may limit the application of other available frameworks (Gupta et al. 2018).

## Method

The Department of Personnel and Training, Government of India (GoI), and United Nations Development Programme (UNDP) initiated an assignment titled "Strengthening HRM of Civil Services" in 2011 with the aim to transition civil services from a rule-based administration to a competency-based approach. With help of experts (i.e., serving civil servants from both Indian central and state governments), a competency dictionary consisting of 25 core competencies across different roles was developed (Government of India-UNDP 2013). Subsequently, this list was circulated to the faculty members of LBSNAA. Each faculty was tasked to enlist 8–10 competencies, which according to them would be relevant for future "DMs." A list of top 14 competencies took shape, based on which a focused group discussion was conducted to bring out the final list of eight competencies, as presented in Table 1.

## Competencies Identified

Table 1 presents the competencies identified along with their definitions

Importantly, transitioning to "competency-based approach" would only be complete when

**Leadership Competencies of Public Administrators in Millennial India, Table 1** The eight main competencies identified along with the relevant description

| Competency | Description |
|---|---|
| 1. Decision-making | Takes into account relevant facts, tasks, goals, constraints, risk, and conflicting points of view to make timely decisions |
| 2. Innovative thinking | Approaches issues differently, offers alternate/out-of-the-box solutions, open to change, and strives for efficiency by working smartly |
| 3. Integrity | Regularly behaves in an open, fair, and transparent way, honors one's commitments, and works to uphold the values of public service |
| 4. Leading others | Ability to engage, galvanize, and enable the team to excel |
| 5. People first | Passion for serving people with distinctive care for the marginalized and needy. Being approachable, warm, caring, and unbiased while interacting with people. Realizes the need of the people and constantly strives to improve the public services |
| 6. Planning and coordination | Ability to plan, organize, and monitor work with effective deployment of resources such as time, money, and people |
| 7. Problem-solving | Appreciate a situation by breaking into parts, organizing information methodically, and setting priorities |
| 8. Self-awareness and self-control | Recognizes one's own emotional causes and controls one's emotional reactions. Maintains sense of professionalism and emotional restraint when provoked, faced with hostility, or working under increased stress. It includes resilience and stamina despite prolonged adversities |

**Leadership Competencies of Public Administrators in Millennial India, Table 2** The key behavioral indicators for each level of the eight competencies identified

| Level | Behavior description |
|---|---|
| **Competency 1: People first** | |
| 5 | Tracks global trends, develops strategy, and drives a culture of working with and through delivery partners to establish service levels |
| 4 | Sets standards and systems to improve public services and uses multiple mechanisms to obtain community insights, in order to drive |
| 3 | Promotes a culture focused on the needs of the people; say, redesigns and monitors new initiatives, using technology where relevant |
| 2 | Understands issues from peoples' perspective; anticipates the needs by actively seeking information from all sections of community to improve service |
| 1 | Responds with speed and sensitivity to peoples' needs, mainly service delivery to marginalized |
| **Competency 2: Leading others** | |
| 5 | Communicates a compelling vision and inspires people in rising to the challenge of meeting the goals of civil services |
| 4 | Assumes leadership, empowers, galvanizes, and protects the team and its reputation vis-à-vis the larger organization or the community |
| 3 | Promotes an open culture, secures support, backs the team, and resolves conflict, if any |
| 2 | Creates appropriate structures and promotes team effectiveness and formulates clear objectives for team members to perform |
| 1 | Shares information/reasons to motivate and regularly updates team regarding changes and decisions made on related work |
| **Competency 3: Integrity** | |
| 5 | Is a role model and leads by example by maintaining high standards of professionalism and impartiality |
| 4 | Is seen<br>unflinching on public service values; stands firm when dealing with unreasonable requests and demands |
| 3 | Acts on values even at personal cost and when it is not easy to do so. Has conviction to make and stand by such decisions |
| 2 | Models the civil services values and encourages others to consistently follow them; typically guided by public interest in conflicting situations |
| 1 | Acts ethically. Gives frank and honest opinion when sought. Does not share information loosely with others |
| **Competency 4: Decision-making** | |
| 5 | Makes long-term strategic decisions to manage and mitigate risks in interest of the society |
| 4 | Makes decisions in complex situations and clearly communicates at a strategic level to move things forward |
| 3 | Demonstrates decisiveness when under pressure or faced with uncertainty and/or limited information; consults experts to get additional information |
| 2 | Gathers information for decision-making and empowers team members to make decisions. In case of ambiguity, gathers information/new data for decision-making |
| 1 | Follows guidelines effectively and maintains clear communication and transparency on the reasons for the decision taken |
| **Competency 5: Planning, coordination, and implementation** | |
| 5 | Long-term planning focus to create a stable and predictable environment to enable organization in reaching its full potential |
| 4 | Manages competing priorities along with balancing the priorities of different interest groups keeping in mind the bigger picture |
| 3 | Considers interrelated activities to produce an integrated plan to achieve the overall objectives. Prioritizes tasks, anticipates, and manages risks |
| 2 | Monitors own progress and keeps oneself up-to-date to makes necessary adjustments to timelines, work plan, and resource allocation as necessary |
| 1 | Organizes and schedules own work and uses available resources optimally to meet work objective |

(continued)

**Leadership Competencies of Public Administrators in Millennial India, Table 2** (continued)

| Level | Behavior description |
|---|---|
| **Competency 6: Problem-solving** | |
| 5 | Develops solutions to complex problems that address not only immediate quick fixes but also takes steps for medium- to long-term impact of the solutions |
| 4 | Identifies multiple relationships to diagnose multiple cause-and-effect relationships in a problem, develops options, and mitigates risk |
| 3 | Identifies basic cause-and-effect relationships to weighs pros and cons of different options |
| 2 | Breaks down problems and complex issues into smaller parts for easier analysis of the root cause |
| 1 | Organizes information systematically in order to identify critical problems |
| **Competency 7: Self-awareness and self-control** | |
| 5 | Nurtures a culture of rationality, calm behavior, and emotional maturity in a large organization |
| 4 | Manages self and others under high stress or adversity and coaches/mentors others on ways to manage stress |
| 3 | Manages stress effectively and continues providing effective leadership in situations of stress or adversity |
| 2 | Responds calmly in difficult situations and is aware of how one's emotions and actions impact others |
| 1 | Is aware of self and restrains emotional impulses and remains calm in stressful situations |
| **Competency 8: Innovative thinking** | |
| 5 | Creates a culture of innovation, flexibility, and responsiveness, mobilizing the organization resources to respond swiftly to changing priorities |
| 4 | Encourages "out-of-the-box" solutions and puts in place mechanisms to identify and implement changes to transform flexibility, responsiveness, and quality |
| 3 | Proactively engages with stakeholders to effect continuous improvement in service and is prepared to meet the challenges of difficult change |
| 2 | Suggests innovative ways of solving issues and improving current ways of working; applies learning from experience |
| 1 | Is open to new ideas and change and improvises in case of issues of urgent importance |

Source: Competency Dictionary for Civil Services (Government of India-UNDP 2013); and Leadership competencies for effective public administration: a study of Indian Administrative Service officers Gupta et al. 2018

key behavioral indicators for each competency are known, as presented in Table 2.

A questionnaire survey consisting of the key behaviors related to each of the competencies identified was administered to the serving IAS officers with a minimum tenure of 3 years. The primary reason for administering this survey was to carry out *training needs analysis* by the last two authors – as part of their work in designing the training modules and content at the LBSNAA. It was ensured that the IAS officers responding to the survey were a mix of a wide range of experience with an average of 15 years of work experience having representation from all parts of India. The survey taken by 218 IAS officers gave insights into the key behaviors for each of the competencies identified. Table 2 presents the behavioral indicators for each of the competencies identified. Subsequently we move to summarize the frequencies for the different behavioral indicators for the eight competencies identified.

For the "leading others" competency, "empowers, inspires, and galvanizes the team to achieve the administrative objectives" was identified as the significant behavior as indicated in Fig. 2. The consequence of this competency is the "people first" in which the IAS officers identified the use of technology to redesign and monitor the public service as the most important behavioral indicator as indicated in the Fig. 1. As highlighted earlier the IAS as a DM often ends up working on issues impacting some stakeholders adversely, but nevertheless, they have to take a buy-in from the relevant stakeholders. The ability to foresee the impact of decisions was identified as an important indicator for the "decision-making" competency (Fig. 3), while optimum resource allocation was critical for the

**Leadership Competencies of Public Administrators in Millennial India, Fig. 1** Figure indicating the preferred behavioral indicators for People First Competency

**Leadership Competencies of Public Administrators in Millennial India, Fig. 2** Figure indicating the preferred behavioral indicator for Leading Others Competency

**Leadership Competencies of Public Administrators in Millennial India, Fig. 3** Figure indicating the preferred behavioral indicator for the decision-making competency

"planning, coordination, and implementation" competency (Fig. 4). The medium- to long-term consideration was identified as a critical behavioral indicator for "problem-solving" (Fig. 5), while the ability to respond professionally was an important behavioral indicator for "self-awareness and self-control" (Fig. 6). Openness to new ideas and change was critical for

L

**Leadership Competencies of Public Administrators in Millennial India, Fig. 4** Figure indicating the preferred behavioral indicator for the planning coordination and implementation competency

**Leadership Competencies of Public Administrators in Millennial India, Fig. 5** Figure indicating the preferred behavioral indicator for the problem-solving competency

**Leadership Competencies of Public Administrators in Millennial India, Fig. 6** Figure indicating the preferred behavioral indicator for the self-awareness and self-control competency

"innovative thinking" (Fig. 7). Honesty, honoring promise, and responsibility were the most important behavioral indicator for the "integrity" competency (Fig. 8).

## Conclusion

It is true that world over public administration has been transitioning into competency-based

**Leadership Competencies of Public Administrators in Millennial India, Fig. 7** Figure indicating the preferred behavioral indicator for the innovative thinking competency

**Leadership Competencies of Public Administrators in Millennial India, Fig. 8** Figure indicating the preferred behavioral indicator for the integrity competency

organizations; however, one needs to bear in mind contextual variations. The uniqueness of Indian context was explained, and subsequently the public administration specifically the IAS and their early leadership role of District Magistrate was put in perspective. Eight competencies were identified, viz., "decision-making," "leading others," "people first," "innovative thinking," "integrity," "planning coordination and implementation," "problem-solving," and "self-awareness and self-control," through expert inputs from trainers and serving officers of LBSNAA. These competencies identified are also in consonance with the key traits identified by Kirkpatrick and Locke (1991) such as drive, honesty and integrity, self-confidence, and motivation, which enable a leader in the necessary skill acquisition and upgradation.

These competencies along with desired levels can be used as a benchmark for effective training of the new recruits. The training modules could be designed to incorporate the development of the competencies identified. Additionally, the recruitment and selection processes could be done based on these competencies. The behavioral indicators for various competencies can also be used for the performance management of the IAS. The survey (see Figs. 1, 2, 3, 4, 5, 6, 7, and 8) observes that the level of competency "problem-solving" and competency "leading others" demanded to perform as DM are far higher compared to the level of competency "integrity" and competency "planning coordination and implementation" to perform indicating the demanding and practical nature of challenge.

## Synonyms

Leadership education; Leadership training; Management education; Management improvement; Management training

## Definition

Leadership development is defined as "expanding the collective capacity of organizational members to engage effectively in leadership roles and processes" (Day 2000, p. 582).

## Introduction

Leadership development, while conceptually intuitive, requires complex interactions between mentors, peers, and those who are led within a social network that may extend beyond the organization. Given today's competitive and interconnected environment, organizations of all sizes and across all sectors should be concerned with developing effective leaders. Effective leaders engender innovation, respond and adapt to market changes, are creative at solving problems, and maintain a high level of performance (Amagoh 2009). While there is not a universally accepted definition of leadership, it is often described as a form of motivation where a leader compels action through noncoercive means (Popper and Lipshitz 1993). Thus, the focus tends to be on the dyadic relationships between a leader and follower, rather than the organizational conditions needed for the development of effective leaders. Leadership development looks beyond developing individual skills and is distinct from leader development. Given this, traditional leadership theories tend not to be very helpful in understanding the process of development.

Development implies a change in state over time from simpler forms of activity to more complex thought processes and activities. For example, an employee relegated to carrying out the same job functions and tasks is not undergoing development since there are no changes to her ability to perform new or complex duties. It is the ongoing cycle of learning, growing, and becoming more capable that facilitates an individual's ability to address more complex problems and situations. In its simplified form, leadership development is the process of helping individuals

to develop the skills necessary to become effective leaders.

Popper and Lipshitz (1993) identify three components of a successful leadership development program. The first is developing self-efficacy or the extent to which an individual believes in his ability to perform well in a given situation. Second is recognizing that developing different types of leaders requires multiple approaches to motivation. The third incorporates developing specific leadership skills, both written and oral, that in turn will enhance interactions between leaders and followers – and ultimately lead to increases in followers' motivations. Day et al. (2014) notes that leadership development is inherently multilevel and longitudinal. It requires a focus on both the development of the individual as a leader and on the social capital created by the interaction between the leader, followers, and social environment. It is also important that individuals be given an opportunity to practice new skills and knowledge in an actual work environment, rather than exclusively within a classroom setting.

## Approaches to Developing Interpersonal and Intrapersonal Leadership Skills

According to Day (2000, p. 585), the "primary emphasis in leadership development is on building and using interpersonal competence." A leader skilled at interacting with and influencing others has a high degree of interpersonal competence. Enhancing social awareness and social skills are two primary ways to increase interpersonal competence. Specifically, developing skills related to the ability to coordinate activities, negotiation skills, and skills of persuasion, as well as cultivating an awareness of the reactions of others along with an understanding of why they react in a certain way, will lead to a gain in interpersonal competence (Mumford et al. 2007). Moreover, the success of leadership capabilities is partially dependent upon the social context within which they are practiced. For example, an otherwise outstanding manager may be ineffective within an organization if his skills were developed without reference to the context in which the manager works. Thus, there is the potential for leadership development activities to contribute to the social capital of the organization and make it more effective overall. As a result, developmental activities should be designed with their impact on social capital development in mind (Day et al. 2014).

There are a variety of approaches available that can be integrated into a leadership development program. Though most leadership development programs will entail some degree of formal classroom training, a myriad of other approaches should be incorporated in order to address both the human and social capital components of development. According to Day (2000, p. 586), there is a "need to transcend the outdated notion that leadership development occurs only through specially designed programs held in particular locations." Rather, leadership development is an ongoing and continuous process that can occur anywhere.

### Experience-Based Approach

Thomas and Cheese (2005) devised the experience-based approach, which requires individuals to continuously examine their own experiences for insight into what it takes to lead and develop more fully into an effective leader. The experience-based approach encourages lifelong learning, as individuals rely on the totality of their experiences for direction and guidance (Amagoh 2009). For example, the experience gained through different job assignments can push individuals to be better strategic or critical thinkers. Through different job experiences over time, individuals acquire increased leadership capacity.

While there is an assumption that experience plays an important role in effective leadership, job tenure has not been shown to be a good predictor of leadership ability (Day et al. 2014). Leadership derives from complex interactions between people within the social and organizational environments where they work (Day 2000). Time on the job alone is insufficient to guarantee the quality of knowledge, skills, and experiences gained at each position that aids in the development of leadership

capabilities. Additionally, not all leaders learn at the same pace or in the same manner, and different types of experience may be more beneficial in leadership development at varying points in the careers of different individuals (Mumford et al. 2000a). It also takes time for individuals to move from leadership concepts learned to the ability to demonstrate those concepts through leadership behaviors. A benefit of the experience-based approach, however, is an organization's ability to link the formalized components of its leadership development program with actual work assignments.

### Skill Development

Not all leaders share the same characteristics and skills across similar developmental levels. Rather, there is a diversity of traits, abilities, personalities, and behaviors among individuals (Mumford et al. 2000b). This may even be true for individuals who progressed through similar leadership development regimes. Skill development occurs in a progressive fashion over time, with an individual moving from simpler skills to more complex ones as leaders interact with and learn from their experiences. Each successive skill level requires greater sophistication in capabilities across skill domains focused on how individuals internalize their experiences. Mumford et al. (2000a) found that technical training was more strongly related to increases in skills as individuals progressed from lower- to mid-level positions within an organization. As leaders rise to more senior level positions within the organization, acquiring higher-level strategic and business skills becomes more predictive of increased levels of performance than other intrapersonal or interpersonal skills (Mumford et al. 2007).

### Personality Development

Historically, the impact of personality traits on leadership ability has generally not been found to determine leadership effectiveness, yet studies have also shown that personality should not be excluded from the study of leadership (Day et al. 2014). For example, conscientiousness has been identified as a significant predictor of leader performance. In a large study of identical ($N = 238$) and fraternal ($N = 188$) twins, Arvey et al. (2006) found that 30% of the variance in leadership role occupancy could be explained by genetic influences and the remainder by environmental factors.

Mumford et al. (2000b) found that individuals lacking the ability and motivation required for skill development were less likely to hold senior leadership positions. This is consistent with the finding that self-development activities are predictive of leader development activities. Specifically, individuals with personality characteristics related to work orientation (job involvement, organizational commitment), mastery orientation (conscientiousness intellectual maturity), and career-growth orientation (feedback-seeking behaviors) display more motivation to engage in leadership development activities and are more skilled at engaging in these types of activities. Self-development enables leaders to adapt to both internally and externally changing environments and to be more productive and effective (Boyce et al. 2010).

## The Tools of Leadership Development

Allio (2005) notes that most leadership training initiatives do not produce leaders because the core leadership traits of character, creativity, and compassion cannot be taught cognitively. Successful leadership development is less about specific tools or practices and more about consistent and intentional implementation throughout the organization and across organizational levels. However, effective leadership skills can be taught by supplementing training with learning challenges and mentoring. While many of the tools reviewed in this section were originally developed for purposes other than leadership development, each has been shown to be at least partially effective in this area and in many cases may "[. . .] form the backbone of contemporary leadership development systems" (Day 2000, p. 587).

### 360-Degree Feedback

360-degree feedback (also known as multisource feedback, multi-rater feedback, and 360-degree

assessments) has been widely used in the area of performance management and has become a prominent process in leadership development (Day et al. 2014). It is a form of assessment that captures not only an individual's perceptions of their own leadership skills but also the perspectives of others connected to the organization. The assumption is that there will likely be differences between these perspectives, thus providing the leader with valuable feedback regarding how others view his overall performance and effectiveness. 360-degree feedback processes hold a methodological advantage over other assessment tools by minimizing the validity threats of self-report bias. Donaldson and Grant-Vallone (2002) suggest at least two data sources, such as peers, subordinates, supervisors, and, on occasion, external stakeholders. This ties into an important assumption that individuals behave differently with different constituencies and are perhaps more effective with some than others.

### Coaching

Coaching is a form of one-on-one learning and behavioral change. It involves practical, goal-oriented interactions between a coach and an individual aimed at improving individual performance and personal satisfaction (Day 2000). In turn, this leads to improvements in overall organizational effectiveness. Coaching relationships typically unfold over the course of several months, but can be limited to a discrete event or specific area of growth and improvement. Coaches are oftentimes external to the organization, but may be internal, and engage in a process of diagnosis, intervention, and follow-up maintenance and support. While coaching can be a proactive process aimed at enhancing one's leadership skills, it has been estimated that three-quarters of coaching relationships begin due to a perceived crisis (Day 2000). Organizations should be sensitive to any potential stigma attached to beginning a coaching relationship. Day (2000) suggests that when everyone has a coach, it helps to avoid the potential for negative stigma as well as possible feelings of favoritism that might occur when coaching is limited to a single individual. While there are many benefits of utilizing coaching as a leadership development tool, the relatively high cost of coaching may make it difficult for all, but the largest organizations to afford even though productivity gains from coaching may be large when integrated with other development activities.

### Mentoring

Mentoring is a form of leadership development that occurs between a more experienced or skilled mentor and a less experienced or skilled protégé. This usually entails pairing a senior executive or manager with a junior one. This dynamic leads to greater intrapersonal competence, as it provides the protégé with a more sophisticated and strategic perspective on the organization. Mentoring relationships can also take the form of peer or group mentoring depending on the needs and preferences of the organization and individuals involved. Mentoring relationships are intended to be of benefit to both the mentor and the protégé. Through mutual learning, mentors are able to hone their leadership skills by leading the protégé; by contrast, the protégé develops leadership capabilities from the feedback received and role modeling that occurs (Amagoh 2009).

Mentoring programs can be formal in nature, where they are planned, monitored, and evaluated by the organization. Informal mentoring may also occur and, in fact, may be encouraged by the organization (Day 2000). Additionally, gender has been shown to play a role in mentoring relationships. Dreher and Cox (1996) found that protégés of male mentors experienced greater financial benefits than those of female mentors. There is also a line of research (Day 2000) indicating that race plays a role in the mentoring process, specifically in the way that different racial minorities accept critical feedback given by a mentor.

Mentoring relationships are complex as they are based on a social exchange between at least two individuals. Mentoring programs are intended to foster teamwork, enhance motivation, and improve the competency and skill levels of those involved (Day 2000).

### Networks

As a leadership development tool, networking is intended to assist individuals with fostering broader peer connections and relationships. As Day (2000, p. 596) noted: "An important goal of networking initiatives is to develop leaders beyond merely knowing *what* and knowing *how*, to knowing *who* in terms of problem-solving resources." Networks provide individuals with an additional source of expertise and support outside of their immediate work group or organization that can be tapped into when needed. Networking initiatives tied specifically to leadership development initiatives might take the form of formal seminars or workshops or less formal weekly or monthly luncheons. Networks can also be established through electronic dialogue (an electronic mail list serve or discussion board), where individuals seek out guidance, discuss mutual challenges, and share opportunities. A primary emphasis is placed on building support among peers, which in turn leads to individual growth and development. Peer relationships tend to be long-term relationships covering years as opposed to the shorter-term relationships developed in mentoring and coaching activities (Day 2000). In the area of leadership development, organizations should promote both informal and formal networking initiatives by making such opportunities known as well as promoting the benefits of networking.

### Action Learning

According to Amagoh (2009, p. 996), "Action learning is a vital component of most leadership development programs, and constitutes one of the core leadership development methods at best-practice organizations." Action learning is premised on the belief that individuals learn best when working on real-time organizational problems (Revans 1980). Action learning entails learning through doing, as opposed to traditional, lecture-based classroom instruction. As Revans (1998, p. 14), the founder of action learning, noted, "there can be no action without learning, and no learning without action." This is because lessons learned through traditional classroom instruction most often do not alter an individual's long-term behavior. Rather, shortly after the training has concluded, there is a strong tendency to slip back into previous behavioral patterns. Action learning involves a continuous process of learning and reflection, with the primary goal of getting work done. When individuals are engaged in meaningful action coupled with conscientious inquiry and reflection, the opportunity for long-term learning emerges. As such, action learning has been rated higher than coaching and 360-degree feedback as a leadership development tool (Leonard and Lang 2010).

While the basic action learning model is similar across organizations, a benefit of action learning is that learning is focused on developing skills and competencies deemed important to the individual. In other words, it is not based on a standard curriculum or universal set of skills. Moreover, action learning can be used in the development of virtually any leadership behavior or skill, but it is particularly effective in developing collaboration, conflict resolution, and sharing skills (Leonard and Lang 2010).

## The Challenge of Leadership Development in Public Organizations

Given funding constraints in government, leaders in the public sector generally must function with fewer resources than their counterparts in the private sector. Fewer resources often lead to an inability to provide adequate incentives, which makes it more difficult to motivate employees. However, the overriding concern in the public sector is greater than employee job performance and satisfaction: leadership deficits have a direct influence on the quality of governance. Public managers also require extended leadership competencies related to service delivery through partnerships, networks, and other types of contractual arrangements. Resource constraints and the impact of networked governance tend to make effective leadership development a critical issue in the public sector. Yet, Schofield et al. (2008) note that only 36% of public sector respondents in a UK study reported that their organization was doing enough to develop the next generation of

leaders. In the 2015 update to the study examining the best places to work in the US federal government, only 51.6% of federal employees thought their agency had effective leadership with only 43.8% saying their senior leaders were effective (Partnership for Public Service 2016). In a study of US federal government leadership development programs, Ingraham and Getha-Taylor (2004, p. 111) found that private and public sector approaches to leadership development have more similarities than differences, but that the "public sector needs to get serious about leadership." They further note that the design of public leadership development programs will depend on the organization's goals, specific needs, and core competencies and must target the development of leaders at all levels. Leadership development in public administration is not necessarily different from leadership development in other disciplines, but designing the development program within the framework of the public context is essential to maximize the effectiveness of the organization.

## Conclusion

The importance of leadership development extends beyond the individual level. The nature of today's complex and interconnected organizations requires strong leadership. Effective leaders can have a positive impact on their organizations, while similarly ineffective leaders can have a negative one. Leadership development programs should focus on building interpersonal and intrapersonal leadership skills, as well as employ a variety of development tools. Tools such as 360-degree feedback, coaching, mentoring, networking, and action learning are found in many of the most successful leadership development programs. The key to effective leadership development, however, is intentional and sustained implementation of the specific development techniques endorsed by the organization. Leadership development need not be confined to the upper echelon of the formal organizational hierarchy; rather, it should be infused throughout the organization. Groves (2007, p. 256) recommends that organizations focus on six leadership development pipelines: (1) develop a mentoring network by engaging all managers in mentoring relationships, (2) engage managers in the process of identifying high-potential employees, (3) engage managers at all levels in development activities of high-potential employees, (4) avoid heir apparent designations when engaging in succession planning and instead base those decisions on a diverse pool of candidates, (5) seek to establish a supportive organizational culture by engaging senior management in development and performance management activities, and (6) evaluate the success of the leadership development activities within the organization.

Strong leadership is viewed as a precursor to organizational performance and growth. It is also understood that most leaders are not born; rather, they are made or are "grown" (Blunt 2010, p. 38). This implies that the knowledge, skills, behaviors, mind-sets, and abilities needed to be an effective leader can be developed. Thus, effective leadership development benefits not only the individual but also the organization as it seeks to develop the workforce necessary to meet current and future challenges.

# Leadership Development in Organizations

Rebecca J. Reichard and Dayna O. Walker
Division of Behavioral and Organizational Sciences, Claremont Graduate University, Claremont, CA, USA

## Synonyms

Leader development; Management development; Talent development

## Definition

Leadership development is the increase in the collective leadership capacity of an entire group, department, or organization. Leader development is the increase in a single individual's capacity to fulfill leadership roles and responsibilities.

## Leadership Development in Organizations

To understand development of leaders, it is important to first clearly define the terms leader and leadership. A leader is an individual who influences oneself and/or group members toward a goal. Leaders may be in a formal managerial role (e.g., supervisor), may emerge from a peer group, or may rotate from person to person. Viewed this way, development emphasizes change in an individual leader's knowledge and skills (Day 2000). For example, activities such as formal classroom training, job rotation, and off-site meetings are often-used forms of *leader* development. Whereas "leader" refers to an individual, the term leadership refers to an interactive process of social influence. From this perspective, the individual leader is but one component of an interactive network (Marion and Uhl-Bien 2001), characterized by reciprocal influence. As such, Day (2000) defined *leadership* development as a group level phenomenon, where the group's total leadership capacity

is increased through developmental activities aimed at building interpersonal relationships. So, although these terms are used interchangeably herein, leadership development encompasses the development of individuals as leaders; it goes beyond to emphasize the development of the leadership of the collective.

## Leadership Development Fundamentals

The practice of leadership development in organizations has long outpaced the empirical research to support these practices, creating a challenge for managers who wish to ground their leadership development practices in evidence-based methodologies. However, research on leadership development has advanced considerably in the last 25 years, catching up considerably with current practices and pushing the boundaries of what is known about how leaders develop over time.

People often wonder how much of leadership is "made" versus "born." A common misconception held by leaders and non-leaders alike is that leadership is an innate gift that certain individuals are simply endowed with at birth. Some people possess special traits – outspokenness, likeability, and charisma – that other people do not possess and cannot develop. However, studies conducted on identical twins raised apart (thus teasing out the effects of nature versus nurture) demonstrate that only about 30% of leadership emergence in adulthood can be traced to hereditary factors (Arvey et al. 2006). That leaves about 70% left to be developed over time through practice. Thus, the idea that leaders are simply born and not made is, in fact, a myth challenged by the current research evidence. An important implication of this finding is that organizations do not necessarily have to hire externally to find qualified leaders because they can cultivate leadership from within their current employees. Nonetheless, cultivating leadership takes both time and resources, and the outcome of these investments may not be readily apparent.

Leadership development occurs over the entire human life span (Day et al. 2009). Beginning in early childhood and extending into retirement, people who put themselves in challenging leadership situations and reflect on their learning will likely continue to develop as leaders. In fact, studies show that when leaders experience more developmental challenge (i.e., unfamiliar work situations, high levels of responsibilities, the need to influence without formal authority or manage diversity) and when leaders reflect on these experiences in a structured way, they are more likely to develop (DeRue et al. 2012). However, development may not always be positive or linear. In fact, recent evidence suggests that leadership performance can even decline over a short time span of 3 months (Day and Sin 2011). Any potential growth experience may involve some setbacks, so although leadership development may not always be positive in the short run, with continued focus on learning, change is possible over the long run.

## Leadership Development Outcomes

What develops in leadership development? The vast majority of research and writing in the domain of leadership centers on answering the question "what is effective leadership?" that leaders should be developing toward. Briefly, many theories and tests of leadership have been put forth, and the major ones include behavioral theories, contingency theories, and new-genre theories of leadership. With regard to behavioral theories, researchers at Ohio State University identified two broad categories of effective leader behaviors, those focused on structuring the group's task (i.e., initiating structure) and those focused on building relationships within the group (i.e., consideration; Stogdill 1950). A series of additional leader behavior styles emerged, such as autocratic versus participative leadership. Contingency theory refined this behavioral approach by setting forth various situational factors (i.e., existing leader member relations, task structure, and leader position power), which determined when each of these leader behaviors would be more or less effective (e.g., Fiedler 1967).

More recently, a set of theories referred to as new-genre theories of leadership have emerged (e.g., charismatic and transformational leadership), with the theory of transformational leadership dominating this paradigm (Bryman 1992).

Transformational leadership refers to a set of leadership behaviors which inspire followers to achieve performance beyond expectations by aligning the followers' goals with those of the group (Bass and Riggio 2006). A series of correlational meta-analyses have demonstrated the positive relationship between the four transformational leadership behaviors (i.e., idealized influence, inspirational motivation, individualized consideration, and intellectual stimulation) and important organizational outcomes (e.g., Judge and Piccolo 2004). As a result, more recently the number of studies focused on training and developing transformational leaders has been on a steep increase (Avolio et al. 2009).

An even more recent perspective on leader development, "authentic leadership development," provides a different view on the above perspective (Gardner et al. 2005). According to this approach, leaders should align their values and behaviors through gaining heightened levels of self-awareness, self-regulation, and self-development (Reichard and Johnson 2011). Authentic leaders are transparent in their interactions, try to see multiple perspectives on an issue, and have a strong moral compass (Walumbwa et al. 2008). This approach to leader development aligns with the Gallup organization's positive psychological approach of strength-based leader development, where a leader first identifies their natural talents, further develops them into strengths through training and development of functional expertise, and builds a team such that team members' strengths balance the leader's areas of weakness (Rath and Conchie 2008).

Finally, leader development outcomes may also be a function of time (Day and Dragoni 2015). Short-term indicators of leader development include outcomes such as changes in leadership confidence, self-awareness, knowledge and skills, and identifying as a leader. Longer-term outcomes of leader development include things such as deeper or more complicated understanding of leadership and adult development. For example, novice leaders often see leadership in terms of hierarchical roles and job titles (i.e., a simplistic view), whereas more advanced leaders see leadership in terms of ongoing and informal social influence independent from formal job titles (i.e., a more complicated view). At the group level, short-term indicators of leadership development include changes in outcomes such as shared mindsets, team learning, knowledge of team members' unique skillsets, and psychological safety (the team's trust in the ability to be vulnerable with one other). Finally, a longer-term outcome of leadership development is improved leadership capacity (Day and Dragoni 2015). An important implication of this research is when designing and evaluating leadership interventions, it is important to be mindful of the specific outcomes sought and to be realistic about the time span over which those outcomes are likely to unfold.

Taken together, the emerging thinking on leader development has shifted away from prescribing development toward specific leader behaviors or styles that a leader *should* enact and has instead began to emphasize a more complex, long-term exploration of one's core values and identity and aligning leadership behaviors with one's true self.

## Leadership Development Practices

Due to the importance of having qualified leaders at all levels of organizations, managers and human resource professionals use a variety of leadership development tools and interventions to improve individual and collective leadership capacity. This section outlines the most commonly used practices, highlighting the strengths, limitations, and degree of empirical support of each (see Table 1).

**Competency Models**. A popular approach used by 75–80% of companies, competency modeling is the process of (a) identifying competencies and (b) linking them to various human resource management systems, such as leadership development. Competencies are organizationally valued personal characteristics assumed to drive the competitive advantage of the business. Examples of competencies include "drive for results," "business acumen," and "leading courageously." Once identified, linking competencies to leadership development involves integrating assessment, training, experiential opportunities, and succession decisions to the competencies.

**Leadership Development in Organizations, Table 1** Common leader development practices

| LD practice | Description | Strengths | Limitations | Empirical support |
|---|---|---|---|---|
| Competency models | Framework defining effective leadership linked to the strategic success of the organization | Alignment with business strategy | Difficult to clearly define and assess | Limited |
| Leader assessment | Feedback provides information on strengths and weaknesses to increase leader awareness and inform development goals | Self – quick, inexpensive; 360 – incorporates multiple perspectives; identify blind spots; Assessment center – behavioral focus | Self – self-enhancement bias; 360 – perceptual biases; Assessment center – exorbitant cost | Moderate |
| Identifying high potentials | Early identification of organizational members who have the potential to fill key leadership roles within the organization | Succession planning; acknowledges differing levels of developmental readiness | Potential political divisions; potential to overlook underperformers | Limited |
| Formal training | Structured events and courses organized by the organization, including both virtual and in-person programs | Efficient; standardized | Transfer of training to job; limited flexibility | Large |
| Job rotations | Moving employees through a series of jobs in a variety of functional areas or among multiple jobs in a single functional area | On-the-job learning, exposure to multiple contexts and networks | Difficulty of managing rotational assignments | Moderate |
| Action learning | A group of 6–30 leaders collaborate to plan and implement a solution to a real organizational problem | Experiential learning; internal networking and relationship building; long term and low cost | Viewed as unimportant if problem is not high priority; difficulty collaborating in competitive cultures | Limited |
| Executive coaching | One-on-one collaboration between coach and leader to improve the leader's leadership | One on one; flexible; adapts to leader's needs | High cost | Moderate |

The keys in identifying such competencies are the link to business strategy and the separation of the best leaders from the rest. However, this can be an arduous task. Often identification of competencies is based on top management preferences as opposed to empirical procedures often used in traditional job analysis (Sanchez and Levine 2009). As a result, the competencies identified are often not behavioral in nature and difficult to clearly define, objectively assess, and ultimately develop. Further complicating the use of competency models is that most are propriety to a particular consulting firm or organization, which makes any systematic investigation or analysis tenuous. Taken together, there is limited empirical support for the use of competency modeling in leadership development.

**Leader Assessment**. With regard to leadership development, the primary role of assessment is to facilitate leader awareness of their strengths and weaknesses and inform development planning. The three major forms of leader assessment – self-report, 360° feedback, and simulations/assessment centers – each have their advantages and limitations. Self-report simply involves asking leaders to offer their personal opinion on their leadership strengths and weaknesses. The measures used for self-report assessment can range from a resume, interviews, and open-ended questions to quantitative (Likert-type) survey ratings.

Although self-report assessments are quick, inexpensive, readily available, and easy to implement, they suffer from self-enhancement bias due to impression management motives and are hypothetical in nature.

In 360° assessment, leaders' self-ratings are contrasted to ratings from the immediate supervisor, peers, subordinates, and sometimes even customers. The level of agreement between self and others' ratings can shed light on a leader's blind spot (Fleenor et al. 2010). Some leaders overestimate their leadership skills, and although some level of confidence is healthy, taken to the extreme, this can result in "surprise" failures. On the other hand, some leaders underestimate their leadership skills, which may be a result of low confidence, the imposter syndrome, or a cultural preference for modesty. Through 360° feedback, leaders' self-awareness should be enhanced allowing targeted efforts to identify and eliminate deficits or integrate and build upon strengths through leader development planning.

Advantages of 360° assessment are inclusion of others' views of the leaders and, like self-report assessments, are relatively easy to implement and score on a large scale using online systems with a moderate cost. However, others' assessments of a leader are far from perfect as they tap into others' *perceptions* of a leader's behaviors *not* actual behavior. Perceptions can be biased due to rater motivation (e.g., politics, lack of accountability, lack of trust in assessment process), contextual factors (e.g., lack of opportunity to observe, observations in strong versus weak situations), rater characteristics (e.g., mood), and rater-ratee interactions (e.g., in-group/liking; Fleenor et al. 2010).

A third approach, assessment center, is a method that uses multiple assessment techniques based on standardized methods and pooled judgments of multiple assessors (International Task Force on Assessment Center Guidelines 2009). Common simulations include an email activity, leaderless group discussion, and one-on-one role play with a trained actor playing the role of a follower. Regardless of simulation format, each simulation is standard in terms of instructions, timing, and experience for each leader. Simulations are evaluated by trained assessors using behaviorally anchored rating scales. Because the focus is the actual behavior that the leader displayed during the simulations, assessment centers have an advantage over other forms of assessment. In fact, assessment centers have shown low adverse impact and good predictive validity of leader job performance (Arthur et al. 2003). On the negative side, assessment centers are prohibitively expensive and time-consuming, do not tap routine performance on the job, and are difficult to develop (i.e., behavioral anchored rating scales).

Taken together, leader assessment plays a major role in self-awareness and leader development planning in leadership development. Assessment tools should be reliable and valid measures of leadership. Empirical research related to the psychometric tools available to evaluate the effectiveness of leader assessment measures is strong; however, there is limited evidence that assessment feedback has positive effects on leader self-awareness and development.

**Identifying High Potentials**. One role of leader assessment is to identify "high potential" employees, who are likely to fill key leadership roles within the organization. Often top management teams will select high potentials based on cognitive skills, personality, learning ability, existing leadership skills and established performance leading, motivation to learn and lead, and values/culture fit with the organization (Silzer and Church 2009). Often high potentials are given additional developmental experiences, such as challenging assignments, job rotation, networking opportunities, and training. Sometimes identified high potentials are made aware of their special status and other times they are not.

An advantage of this approach is that it emphasizes the need to have a pipeline of potential future leaders ready to be promoted quickly. Succession planning is an essential activity for ensuring that smooth transitions can be made if a critical executive quits or retires from their role. Identifying high potentials also signals that certain individuals may be more developmentally ready (motivated and capable; Hannah and Avolio 2010) than others and therefore may yield a larger

return on development investments. However, potential downsides of identifying high potentials include creating political divisions within teams or departments where not everyone is labeled "high potential," setting up unrealistic expectations or feelings of entitlement, and overlooking those that may have future potential but are currently underperforming. Finally, the empirical evidence for identifying high potentials is limited with most applied work being conducted by consulting firms like Korn Ferry.

**Formal Training**. The dominant approach to leadership development, formal training, involves events and courses organized by the organization, including both virtual and in-person programs (Noe 2013). Traditional face-to-face classroom learning falls under this category. An advantage of formal training is that it is an efficient way to deliver large amounts of standardized information to a large group of people. As such, it is a useful means of introducing basic leadership concepts to first-time managers. However, because formal training is limited to structured learning environments (e.g., classrooms, online courses, orchestrated events), there are fewer opportunities for learners to actively engage with the material. This is a problem for adult learners who often prefer concrete experiences over theoretical instruction, are motivated to learn when confronted with real-world problems, and have a need to be self-directed (Knowles 1975). Also, the problem of whether knowledge and skills learned in formal training will transfer back to the job is a major challenge. Finally, the structured nature of formal training limits the flexibility of this approach to be tailored to individual learning needs. As such, formal training should be used intentionally and sparingly and should not be an exclusive means of leadership development for any organization.

The most recent meta-analysis on formal leadership training interventions suggests that, on average, the effect size for pre- to posttest assessment changes in leadership outcomes is about a half standard deviation in the positive direction (Avolio et al. 2009). This means that, on average, leadership interventions tend to be moderately successful though there are many factors that can dramatically increase or decrease this effect (e.g., training participant readiness, program design). Although the amount of available empirical research for the effects of formal leadership training is extensive in comparison to other leadership development strategies, the size of training effects is moderate in degree particularly considering the short-term duration of training studies in the available literature (Avolio et al. 2009).

**Job Rotations**. Job rotation involves moving employees through a series of jobs in a variety of functional areas or among multiple jobs in a single functional area (Noe 2013). The advantage of this approach is that it allows employees to develop leadership through on-the-job experience, which is consistent with adult learning principles (Knowles 1975). Also, exposure to multiple contexts can help leaders learn to appreciate the complexity and dynamic nature of leadership. For example, what works well in one environment may not work in another due to changing contextual factors.

Potential downsides of job rotation include the difficulty of managing rotational assignments. Intentionally moving managers from one functional area to the next essentially increases turnover in those departments, which can create some logistical challenges when the rotating managers frequently change systems, processes, and procedures. Also, frequent leadership changes can leave employees managed by those in rotational assignments feel they are in a perpetual state of flux and uncertainty about the future (Martin et al. 2014). Care must be provided to structure the experience such that learning is maximized for the leader while disruption is minimized for those they are leading.

Rigorous research on job rotation is scarce. However, at least one study has found that job rotation is positively linked to salaries, promotions, and perceived administrative, business, and technical skill learning outcomes (Campion et al. 1994). However, the self-reported nature of results in this study limits the conclusions that can be drawn about objective benefits of job rotation. Therefore, evidence for job rotation is moderate.

**Action Learning**. Action learning involves bringing between 6 and 30 leaders together to

develop and implement a plan to solve a real organizational problem (Noe 2013). The group meets periodically for a few months to discuss the challenge, develop potential solutions, implement plans, and evaluate progress. Often facilitators will coach the team in creating sound solutions as well as structuring the experience for learning. As third parties not directly involved in coming up with the solutions, facilitators can observe and provide feedback throughout the process. Facilitators can either be designated trainers and/or executive leaders in the organization. Executives increase the visibility and importance of the experience, whereas designated trainers can help the group reflect on how communication is occurring, how decisions are being made, and whether any changes would benefit the group.

In addition to the direct benefit of innovative solutions to complex issues, a strength of this approach is that leaders from different functional areas come together to work on a common problem thereby fostering internal networking and relationship building. Additionally, action learning is relatively low cost compared to other methods as it can be conducted by internal staff and requires minimal time away from leaders' day-to-day work (Lamoureux 2010). Ideally, the action learning team works on issues relevant to all participants' actual work responsibilities, thus increasing motivation and transfer of skills. A potential weakness of action learning is that if teams are not tasked with solving a real or important issue, they may not take the experience seriously. Similarly, in highly competitive organizational cultures, action learning can be seen as an opportunity to vie for attention or to demonstrate performance rather than as an opportunity to grow. Careful instructional design and framing can combat these potential challenges.

Although rigorous empirical research on action learning is scant, case studies suggest action learning can help leaders develop leadership skills such as communication and collaboration while driving business strategy (Cone and Woodward 2007; Marquardt 2004). Compared to more rigorous study designs, case studies rank relatively low internal validity because they do not rule out many alternative explanations for the results. Therefore, the existing empirical support for action learning is weak.

**Executive Coaching**. Executive coaching involves one-on-one collaboration between coach and client to improve the client's leadership. The content of coaching is highly dependent upon the individual client's needs, although the process typically involves identifying learning goals, challenging existing limitations, exploring future possibilities for growth, and providing accountability and support in the attainment of desired goals (Ting and Hart 2004). Coaching relies heavily on the use of open-ended and non-judgmental questions to help the client address underlying beliefs and assumptions that may be holding them back from their full leadership potential. Here we refer to coaching as discrete interventions facilitated by individuals trained explicitly in the practice of coaching and contracted by the organization to coach a given individual, as opposed to manager as coach.

An important goal of coaching is to expand the client's perspective of themselves as leaders and of the leadership issues they face so that the client can develop solutions to their own challenges (Noe 2013). A strength of the practice is that because coaching is one on one and has a strong focus on questioning underlying assumptions about leadership and interpersonal interactions, it is well poised to facilitate the longer-term outcomes of individual leader development. Coaches can help clients reframe events or make meaning out of leadership situations in new ways, essentially altering the lens through which the client interprets their role and entire working environment. These fundamental shifts may facilitate deeper and more complicated understanding of leadership as well as more holistic adult development. Coaching is also highly flexible as a practice in that the coach and client can adapt the intervention to meet the leader's specific needs. A weakness of this approach is the expense involved. Highly experienced coaches can charge up to $335 per hour (Corbett and Kennedy 2014). This high cost can be prohibitive for some organizations, and as a result external coaches are often reserved only for executive leaders.

Research on the effectiveness of coaching interventions is still in early stages, but a recent meta-analysis aggregating results from 18 studies suggests that coaching tends to be positively correlated with outcomes such as performance/skills, self-regulation, attitudes, coping, and well-being (Theeboom et al. 2014). Despite this positive initial support, evaluations of coaching tend to be limited to self-report changes in key outcomes, which tend to be inflated upward and biased by memory effects (Ely et al. 2010). Until more rigorous research is conducted and meta-analyses can be conducted on a larger numbers of studies, the evidence base for coaching remains moderate.

## Conclusion

In conclusion, leadership development is a complex topic. A first step is defining what constitutes effective leadership as evidenced by empirical research (e.g., transformational leadership) or for a particular organization (e.g., competency modeling). Taking this a step further considers leadership and leadership development as an emergent and reciprocal process that is collectively rather than individually enacted. A final layer of complexity comes with understanding development as a process that occurs over time requiring long-term planning, motivation, and implementation on behalf of both organizations, teams, and individuals. Given this complexity, current leadership development practices have a number of strengths and limitations that are relatively limited in terms of empirical support. However, the field of research and practice of leadership development is increasingly tackling these complexities and will likely result in innovative future approaches to the leadership development challenges faced by organizations.

Accountability; Ethics; Followers; Integrity; Leaders; Legitimacy; Probity; Responsibility; Supporters

## Introduction: Assessing Leadership

This account of leadership effectiveness is a general guide to a complicated problem. The core problem is how we measure the impacts leaders have and how we distinguish effective from ineffective leaders. Students of leadership encounter many examples of excellent or poor leadership, and of admirable or regrettable individual leaders. The task is to reflect on these examples and to devise a systemic account of leadership effectiveness to help explain the general difference between excellent and poor leadership. This entry develops one such systemic account reflecting recent examinations of leadership where ethics is often the missing ingredient.

Individual leaders have certain qualities of vision and inspiration which help them make their influence. Leaders are characterized by an inner sense of vision which helps them accept the heavy responsibilities of leadership. They are also characterized by the inspiration they can bring to others to share some of those leadership responsibilities (Nye 2014). Yet what makes some leaders more effective than others? Part of the answer is that leadership is a shared activity where a group shares responsibility for shaping the endeavor of a larger team, which often includes many supporters who want to be partners – or at least players – and not simply followers (Ford and Harding 2015; Margetts et al. 2015).

Leadership effectiveness comes about when those formally in charge convince their enterprise

of the larger public benefits they together can provide. Leadership ineffectiveness results when the relationships between formal leaders and the informal entity break down – sometimes from defective vision or inspiration and sometimes from confusion or distrust among supporters (Uhr 2015).

## A Model of Leadership Effectiveness

There is no one privileged academic discipline with unrivaled mastery of the important yet elusive topic of leadership (Grint 2010; Keohane 2010). The tone of this contribution reflects the author's discipline of political science but with many references to other sources, including new leadership journals which indicate how specialized the study of leadership can become. This account describes a model of leadership effectiveness based around three Ps: product, productivity, and probity. These three terms are used generally to refer to three core components of effective leadership. This general model sees probity as an important safeguard of integrity in leadership, which is a missing ingredient in many mechanisms of leadership effectiveness (Uhr 1999). Put very generally, effective leadership builds and promotes a "product" (using this term loosely to describe any good or service valued by others) consistent with "productivity" (i.e., with high returns for resources used) and "probity" (i.e., with high respect for the norms and procedures of public integrity).

To be sure, there are many examples of powerful leaders promoting dubious goods and services with high levels of waste and low levels of integrity. The term "leadership" is ambiguous enough to cover many forms of influential power, including "bad leadership" (Kellerman 2004). The focus here is on "good leadership" in democratic societies where the three Ps sketch an appropriate norm of leadership effectiveness: effective leaders have to have a product worth delivering, have to secure the resources to grow the enterprise, and have to nurture a culture of integrity in that enterprise. The larger team has to know that they are being asked to comply with a culture of public integrity – and that they are an ethical enterprise and not simply a convenience of business or government (Jacobson 2015; Uhr 2015).

Leadership is often thought to be undervalued or even unwanted in democracies, as though "the people" can manage themselves well enough. Democracies actually have their own types of leadership with a greater presence of public accountability than in nondemocratic societies (Beerbohm 2015; Winston 2015). Prodemocratic leadership can make willing leaders use their distinctive vision to inspire their supporters to take substantial roles as stewards of the three Ps described above. Not all leaders want to include supporters and followers in the structure of leadership: many leaders want to be a reframer and not a reflector of their supporters. The trick for reframers is to use a leader's inspiration and vision to persuade rather than compel supporters to see things their way – as modeled in many ways by Mandela whose effective leadership continues to attract close academic attention (Ciulla 2016).

This deft task of reframing reflects the "theater of trust" surrounding democratic leaders: their effectiveness requires that they act theatrically, using their rhetorical gifts to pave their vision and inspiration as pathways forward for those prepared to follow. Slick leaders can use clever rhetoric to disguise defects in their leadership strategy; good leaders try to make a publicly credible case for product improvement (Fairhurst and Connaughton 2014; Keegan 1987, pp. 318–321). The danger of cagy misleading by incompetent leaders means that effective enterprises need to use the administrative checks and balances of public accountability to ensure that their culture of public integrity is properly secured. The task is not to jettison leadership rhetoric simply because it is a difficult and demanding leadership skill often misused by ineffective leaders – Hitler being a standard model (Keegan 1987, pp. 304–310). Instead, the real task is to discover the ways that effective leadership makes good use of leaders' rhetoric to promote probity and public integrity. Our task now is to focus on how the three Ps scheme helps us unpack leadership effectiveness.

## Which Leaders Matter?

Not surprisingly, effective leadership is highly praised. Many media journals publish annual rankings of global leaders which can give us examples of those public figures who seem to dominate the list of noteworthy leaders. The first thing to learn is that some rankings define leaders simply as those who hold power, with the list confined to those power-holders who sit at the top of organizations with no necessary commitment to product worthiness or cost-efficiency or investments in integrity. For our purposes, these "power" rankings are quite useful because they help us begin to see how distinctive more open and accountable forms of leadership effectiveness can be.

Begin, for example, with the *Fortune* list of the "world's 50 greatest leaders," with this group as the top six: entrepreneur Tim Cook, central banker Mario Draghi, Chinese chief leader Xi Jinping, Pope Francis, Indian prime minister Narendra Modi, and singer-songwriter Taylor Swift ("The World's 50 Greatest Leaders" 2015). This is a ranking of "great" leaders where their effectiveness includes making their followers "great" in some valuable sense. Other rankings target particular aspects of "greatness," such as "thought." Note that the leading contenders shift, as we can see in the "thought leaders" ranking of the top six: Pope Francis, novelist Paulo Coelho, economist Muhammand Yunis, novelist Orha Pamuk, whistle-blower Edward Snowden, and writer Umberto Ecco ("Toplist Global 2015" 2015). These two rankings do not give us many examples of leaders in government, in part because the lists are targeted to qualities not often associated with the running of government, such as "greatness" or "thought." But when we turn to the useful *Forbes* ranking of the "world's most powerful people," we get a rather different top six: Russian chief leader Vladimir Putin, German chief minister Angela Merkel, US president Barack Obama, Pope Francis, Chinese leader Xi Jinping, and US philanthropist Bill Gates ("The World's Most Powerful People 2016" n.d.).

Once we move from ranking "greatness" and "thoughtfulness" to ranking power, we bring into focus leaders at the head of governments who fit the conventional model of what a powerful leader looks like. But the price we pay for getting close to power is that we are making no judgment about any of the three Ps in our preferred model of leadership effectiveness. Why is it that Putin fails to feature in the list of greatness or thoughtfulness but tops the power list? And why is it that Pope Francis scores highly on all three rankings: is his greatness a measure of his powerfulness or his thoughtfulness, and what can other leaders learn from him about how to manage the power of thought? Finally, what can leadership analysts learn from Pope Francis about the thought of power which is the main theme of so many conventional studies of leadership?

## Defining Leadership Effectiveness

The term "leadership" refers to the practice of leading (or convening or directing) an organization (Kellerman 2010). The term usually refers to the role of senior officials (e.g., a president or a chairman or general manager or board of management) authorized as "the leaders" of an organization. Small-sized organizations might authorize a small number of leading officers but large-sized organizations often increase "the leadership team" to resemble a committee or cabinet, with a CEO or chief executive presiding over a team of senior executives delegated (or "tasked") with specific responsibilities. In contemporary circumstances, "the leaders" are themselves accountable to those, like a government minister or a board of directors, who appointed them, who monitor their performance as the officials entrusted with the executive power expected of leaders, and in many cases who have the power to dismiss them (Grint 2010).

Leadership is thus the role associated with the exercise of *executive power* and is often used as a term to describe the standards or benchmarks expected of top executives. Executive power is a practical power about getting things done, separate from *legislative power* for officially making the laws and *judicial power* for determining lawful authority. Leadership effectiveness refers to the practical performance of executives as leaders

of their organizations who, often in political settings, implement policy consistent with legal and judicial authority. Thus, there is often a context for leadership, with leaders respecting – or at least not openly disrespecting – legal and judicial priorities. Studies of leadership effectiveness measure the formal and informal skills used by leaders, hoping to encourage high performance from leaders and to help explain low performance by those leaders who encounter limitations either in their internal personal attributes or in their external contexts – for example, when facing opposition or inquiry from nonexecutives such as legislators or judges.

Legislators and judges are often separated from the political executive and most accounts of public leadership minimize legislative and judicial officers. This turn away from two of the three branches of democratic government flatters holders of executive power. But it is also a figment of analysis to ignore the very real leadership provided by legislators and judges which can modify the reach of executive leadership. More than that, it can generate different types of public leadership suited to the public roles of legislators (e.g., as experts in specific policy fields) or judges (e.g., as judicial innovators or legal activists). Academic literature on the roles of legislatures or courts reveal important forms of nonexecutive leadership which even the most ambitious political executives have to take into account.

Traditional approaches to the study of leadership tended to focus on powerful individuals exercising some supreme form of public leadership (Brown 2015). Today, the focus tends to be on groups or collectives rather than individuals. Leadership is now understood as a scheme of networking, with leaders establishing relationships of power-sharing. Executive power can still be treated in terms of singular individuals like heads of government who preside over the executive branch of government. But the more promising approach is to treat executive leadership in terms of networks of power and to see leadership in terms of power-relationships. One important implication here is that leaders have to see themselves as partners in such power-relationships: even those leaders at or near the top of influential institutions operate as partners rather than chiefs – acting more as coordinators than dictators. This implies that leadership effectiveness will be measured according to relationships of shared power through close study of negotiated leadership networks. Highly effective leadership will often be pluralized rather than personal, respecting the shared responsibilities of many leaders in the construction of leadership.

Political leadership is perhaps the most challenging area of modern public leadership (Uhr 2015; Winston 2015). Directing a small or medium organization in civil society requires a great deal of leadership skill; but directing a large public or governmental entity or even a political entity like a city or a state or province requires not only very high leadership skills but also a large number of leaders who can share the multiple responsibilities of executive power. The leadership of a modern democratic nation-state operates through networks of overlapping power, with many different forms of executive power exercised by elected and appointed party-politicians, by professional bureaucrats, by legislative scrutineers, by authorized and sometimes independent "executive agencies" and, to add to the complexity, by judicial arbiters of disputed executive power. There might well be "a leader" in the sense that a president or a prime minister holds formal authority as the chief political executive, yet leadership of the system of democratic governance is not confined to such a monarchical or authoritarian public figure, even if a chief political executive were to try to act like an authoritarian monarch.

Systemic change can indeed occur when, as sometimes happens, chief executives dominate the system of government and become authoritarian or even despotic, threatening to move towards either oligarchy (rule of the rich) or tyranny (rule of the one unlimited ruler). Democratic norms of good public leadership point in other directions with higher expectations of public sovereignty and public accountability. If democratic norms are our preferred political norms, what then are the implications for leadership effectiveness across contemporary democracies? If our models of effective leaders rule out as wayward the bad

forms of leadership of oligarchs or despots or tyrants, what then are ruled in as good forms of leadership effectiveness (Uhr 1999)?

## Types of Leadership

There are many types of leadership in modern democratic societies. As will be examined in the next section below, there are also many types of effectiveness which vary with the sort of leadership being exercised. Focusing here on types of public leadership, we can see that democratic leadership is pluralized, with different types of leadership taking place not only in the central sphere of "the government" but also in wider spheres of "civil society." The public recognize leaders in both spheres, which is one way of saying that public leadership occurs whenever the public – or recognizable elements of the public – define themselves as "followers" of different public figures. Many public figures might try to cultivate a following but the leaders who really matter are those who can speak with some sort of public voice, even if that voice is limited to the language of skeptical opposition to those "in power" who hold executive offices in government (Hudkins 2015).

For example, critics on both the left and the right wings of contemporary democratic governments can mobilize significant public resentment against the mainstream managers of public power exercised by ruling political executives. Leaders on the left can act, a little like US activist Bernie Sanders, in support of socialistic reforms of the system of government; and leaders on the right can act, a little like US activist Donald Trump, in support of libertarian reforms of the political system. In between both types of public leadership, we find a contested landscape of public leadership involving president Obama holding formal authority as the chief political executive competing with many Congressional holders of legislative power, under the watchful care of the judiciary.

Civil society protects many other types of public leadership. Many are business leaders in the private sector who marshal their followers as customers or clients interested in purchasing products and services. Others are in the media sector attempting to shape and mold public opinion through new forms of journalism and public commentary. Others again are in religious spheres where leaders compete as interpreters of sacred scripture who see their followers as communities of faith committed to core religious values, some of which might be consistent with the system of politics and some of which might be antagonistic to those elements of the political system corrupted by antireligious values.

One significant field of leadership comes from those who in parliamentary systems of government are called "the loyal opposition." Disloyal opposition would refer to critics of the constitutional regime who oppose not only those holding executive power but also the established system for the allocation of political powers. The political development of modern democracy has plenty of examples of disloyal oppositionists who have acted as founders of new democratic regimes by destroying earlier predemocratic regimes. Such founders are very important public leaders whose own leadership effectiveness includes threats of civil war and revolution as practices necessary for regime change towards a more democratic future. Loyal oppositionists are those who support the core values of the existing regime but use constitutional means to hold the political executive publicly accountable – through parliament, the courts, the media, and civil society, generally.

Finally, we should note the role of "followers" as leaders (Ford and Harding 2015). Simplified models of leadership often reflect top-down modes of direction with a small minority of proactive leaders commanding the reactive behavior of those who follow the leadership line. More complex models of leadership can include what we might call "lesser leaders" who hold much less power in an organization but who, at certain times, can exercise leadership leverage – sometimes (as the conscience of the team) by holding firm to traditional practices which have gone out of favor with those at the top, at other times (as the inspirer of innovation) by nudging towards improvements in operating processes, and even

at times (as a frustrated friendly critic) by dissenting from existing leaders in order to establish new organizations or new networks capable of bypassing blockages restraining established leadership routines.

One conclusion emerging from this review of types of leadership is that contemporary democratic systems rely on many networks of leadership which do not neatly map on to hierarchical models where leadership is located mainly near the top of a small number of influential pyramids of power. Leadership effectiveness is complicated because many leaders share some but not all of the power necessary to contribute to the public leadership of modern societies. Across government, few heads of even the most powerful agencies can do their work without the active cooperation of many other leaders from many other institutions. While leadership effectiveness within their own agency might rest often on the power of command, effectiveness across networks of shared powers rests on mutually agreed arrangements which require leaders to deliberate frequently over the nature of their leadership projects. The checks and balances of democratic constitutionalism bring with it the obligation for leaders to "negotiate the network" through which their leadership effectiveness will make its mark. Hence, ambitious public leaders are increasingly deliberative and necessarily talkative as they go about "staging" the surprisingly theatrical components of their networks of leadership (Uhr 2014a).

## Types of Effectiveness

To be effective, a leader has to be convincing to supporters and followers. Thus, a basic level of effectiveness is becoming and remaining a leader, whether that be a sole office or as part of a leadership team. But three important questions then need to be asked about leadership effectiveness: is it productive (generating ends); is it economical (conserving means); and is it ethical (integrity-compliant). The three questions comprise a useful framework for establishing whether instances of leadership are fit for purpose, measured by three standard tests of what effectiveness can mean. Take as an example the leadership of newly appointed chief executive officer of a professional body like an association of accountants or doctors or lawyers. These three core questions get at some of the hard realities of leadership, asking whether the new leader is (i) generating a product; (ii) productively managing resources; and (iii) promoting the integrity of the association.

The answers likely to help the new CEO are like three levels of confirmation for the support shown by followers. Of course, some leaders will cultivate supporters who are generous with their trust and do not look very closely at the available evidence which might well modify or even erode their trust. But in the case of a deserving CEO, the three levels of confirmation will clarify the product being generated (such as the reputation for independence of the professional association), the cost-effectiveness of the production process (economical use of resources), and the wider public integrity of the association (promoting the public interest). Each of these three questions measures a core aspect of effectiveness. Trusting supporters will tend to make their own confirmations of their leader's effectiveness; and distrusting critics will tend to discount the evidence readily favored by the leader's followers. The result is debate over the relevance of the evidence gathered around defining the product, calculating cost-effectiveness, and judging ethical integrity. Effective leaders manage these debates to their own advantage, hoping that their leadership rhetoric can persuade audiences of the beneficial impact coming from their energy and ethics (Uhr 2014a).

Admittedly, many debates framed by leaders have more energy than ethics. Students of leadership should not expect scientific norms of strict impartiality to dominate debates over leadership effectiveness which are usually debates over the public value of products, productivity, and public integrity. Many of these debates are professional debates over the nature of the professional-development activity in question: different subtypes of accountants or doctors or lawyers will value the three items quite differently, depending on their professional perspective about the nature of accountancy or medicine or legal practice.

Some debates, however, become increasingly political as leaders and critics debate the wider public value of leadership activities. The most instructive examples are disputes over the leadership of entities providing public services at the request of, but not under the complete direction of, the executive government. In the discipline of public administration, one prominent class of such entities were civil service agencies where few political leaders had as much operational leadership as the many professional civil servants who managed the bulk of policy implementation (Menzel 2015; Uhr 2014b). Questions about the leadership effectiveness of those in charge of a treasury or a state department or a defense agency open up quite complicated exercises in data-gathering as evaluators move from assessing not only partisan political leaders but also professedly impartial bureaucrats. The end result can be several layers of assessment which blend the effectiveness of party-political and bureaucratically neutral leaders who share the leadership of one large and complex public institution.

## Two Examples

Two real-life examples illustrate some of the challenges to leadership effectiveness. Both affect policy makers and public administrators, although in quite different ways. Neither example comes from the mainstream of public policy or administration yet both establish significant policy implications. The first example relates to the automobile manufacturer Volkswagen (VW) with a graphic picture of conventional models of leadership practice which appear to be highly effective – until exposed by skeptical regulators and distrustful media. The second example relates to a famous, or notorious, whistle-blower Edward Snowden (mentioned earlier in the rankings of "thoughtful" leaders): the former contract employee of the US National Security Agency who fled to Russia in order to release national security information in the hope of persuading communities around the world to oppose US strategies of international security. Both are interesting examples of leadership effectiveness. The VW case illustrates the wily practices of a dominant industry specialist with considerable commercial success based on deceptive publicity about diesel engines reputedly minimizing the environmental risks of emission impacts. VW ranked high as a model of leadership effectiveness – until company leaders finally conceded that their predecessors had deceived the international community about the very real emission risks posed by the suspect diesel engines. The Snowden case illustrates the other end of the spectrum where a disgruntled employee breaks loose, armed with vast amounts of secret information from the US government. He seeks refuge in a foreign country where he can challenge the leadership credentials of the US government's security policies and practices.

A common element in both cases is the media. The VW case shows a very large international firm struggling against distrustful journalists and a number of regulatory bodies responsible for managing aspects of health and safety in the USA and Europe. The Snowden case shows the power that can be exercised by one employee (or former contractor) when they seize confidential information, sometimes from willing colleagues, allegedly proving that the US security strategies are more pernicious than we might believe. One lesson is that leaders have to learn to know their limits: the VW leadership team failed to acknowledge that their successful product which was proving a great commercial success was in breach of integrity standards because it misled the regulators about the deceptively high emissions it generated. The VW case apparently did not generate a "Snowden" episode but something of the reverse, in that those who would have known of the leadership deceit did little to publicize these leadership faults publicly. The Snowden case looks at the problem from the perspective of the leadership impact that a quite junior employee can have. Snowden found no way that he could use the information internally to get any change in security policy or administration, which convinced him that his own leadership strategy was to become a whistle-blower to expose the government's deceptive leadership effectiveness.

Both examples fit the three-level analysis outlined above. The leadership team at VW was

convinced that their trusted diesel engines were market leaders which could be very profitable. This team eventually fell under public pressure calling on them to disclose the full story of product deception. The dilemma for VW leaders was that many senior officials managing the firm knew that their claims for leadership effectiveness could not pass the third test of ethical integrity. For years, senior VW leaders enjoyed considerable public praise for winning the first and second tests of leadership effectiveness: they promoted a valued product which was very profitable. The trouble was that the curious regulators knew that the product was too good to be true, and eventually they discovered the evidence from VW about the deceptively clever "switches" which sent misleading information about clean engine emissions. The collapse of the leadership team showed that their so-called effectiveness was eventually misleading – causing the firm to lose very much income and reputation.

The Snowden case is helpful in showing leaders how careful they must be in managing those employees who no longer want to be followers. Even in cases very much unlike that of VW, leadership teams need to know that not only competitors or external scrutineers but also internal employees can believe that their leaders are far from effective despite apparent successes in the two tests of product and productivity. One important implication is that ethics is not only the final but also the fundamental test of leadership effectiveness: effective leaders have to carry the debate over ethics with their immediate internal supporters and also with interested external publics and accountability agencies.

Note that this debate is over *public* integrity and not simply the local values of their accustomed organizational culture. The VW case probably went through phases where local employees were convinced that the style of leadership effectiveness was "the way we do things around here" which can and does benefit the firm. But the test of integrity is substantially more demanding: it asks leaders to align their style of effectiveness around the best available standards which leaders and indeed their critics can see in the best public interest. The VW case faced its moment of truth when the leadership elite within the firm accepted that the standards being used by skeptical regulators were credibly "in the best public interest." The Snowden case draws on, precisely because the whistle-blower has seized a leadership role which is reinforced by his conviction that his disclosures are, at least in his view, also in the public interest – a standard which is persistently denied by his former US paymasters.

## Three Effectiveness Debates

Students of public leadership have warned us against misplaced precision in judging leaders' performance ('t Hart and Uhr 2008). Some forms of leadership effectiveness might fit neatly into tidy categories of analysis but most will be challenging to classify as leaders debate relationships with those sharing leadership power. One lesson is that students of leadership effectiveness have to be prepared to assess the contribution all those (leaders, supporters, followers, even dissenters) with stakes in the leadership activity have in debating and attempting to redirect each phase in the 3P process. The most effective leaders will be those who manage the sometimes protracted debates so that "the enterprise" can come to appreciate the wider public impact of their enterprise – over and above the narrower private benefits gained by those in "the enterprise."

### Debating the Product

The first level of effectiveness is "having an effect" through promotion of a product. The nature of the product depends on the type of leadership under examination. A head of government commands the power of the political executive and can be expected to promote the agenda of the entity he leads, which is the government. A good example is the promotion of public health through the legislation and policy implementation of "Obamacare" by president Obama, which became a classic case study in debates over the effectiveness of this national leader. The leader's craft in securing legislative support for this national policy innovation helped raise his stocks as a leader by showing his renewed effectiveness.

Opponents however saw the initiative as undermining federalism by imposing new demands on state governments to help manage public health care. Thus, the surprising legislative success by a leader without party control over Congress was seized on by followers as evidence of the leader's effectiveness. But the gridlock of federal policy confusion over health care was also cited by opponents as evidence of the lack of effectiveness of this same leader.

### Debating Productivity

The second level of effectiveness is "managing well" through the economic use of resources. Critics of prevailing leaders of government often contend that ruling administrators increase levels of public debt through faulty budget-making. In response, serving leaders can claim that their government budgets have limited public debt and have increased the rates of growth in the economy. At more difficult periods, the same leaders have to call on opponents to rally together with government to lower debt burdens and increase cost-effectiveness. Here is a classic field for debate over the role of productivity in defining leadership effectiveness. What is often typical in these debates is the power conflict between two arms of government where both the political executive and the legislature can have substantial impacts on the content of annual budgets. Even the third arm of government can become involved in judging whether law and policy are strictly constitutional, thereby adding substantially to the burden on executive leaders when justifying their schemes of leadership.

### Debating Ethical Integrity

The third level of effectiveness is complying with public integrity. Probity here is not simply reactive: avoiding reliance on suspicious self-interest falls short of the standard here required. Probity can mean something proactive: such as, promoting wider respect across the enterprise for the norms and processes of public integrity. A leader with evidence of effectiveness in the two preceding levels still needs to provide credible evidence that their economical promotion of a popular service or product does not breach but actually promotes rules or standards of public integrity. This justification of integrity can take either of two forms: minimally, as a reactive defense of due process with claims that no activity by leaders has been out of line with the commonly regarded procedural safeguards in policy making and program implementation; or more constructively, as a proactive argument that the public interest required reforms to strengthen policy and administration against emerging new challenges to the status quo. Typical examples relate to the imposition of new standards or safeguards in health and environmental policy. Reforming leaders claim that new worlds of uncertainty have required new mechanisms of social control to contain emerging risks, such as health hazards or environmental contaminants. Critics of such reformist leaders counter with claims that the governments have over-regulated, with consequential risks to society from intrusive bureaucracy freed from the traditional constraints against improper processes of public administration. In this third phase of leadership, those with their hands firmly on the levers of executive power face their most demanding challenge as they nudge the debate around wider social norms of public integrity, often seen by enterprise insiders as inappropriately external to the leaders' charter. Much to the regret of many leaders, democratic systems of policy and public administration tend to intrude more and more deeply into the inner worlds of leadership effectiveness. Demands of public accountability weigh heavily on leaders on any enterprise deemed to be serving a public purpose, however modest.

## Conclusion: Recovering Leadership Rhetoric

At the beginning, we gave brief attention to two personal qualities of vision and inspiration. We also noted quite different rankings of top leaders with remarkably different pictures of how vision and inspiration work in leadership settings. The hard truth was that those leaders ranked as "the most powerful" tended to score poorly on the

three Ps model of leadership effectiveness. Putin is the outstanding example of a leader who most certainly has "a product" but it is far from clear that he is a model of "productivity" or an exemplar of "probity." This can be contrasted with the rankings of the great and the thoughtful who tend to be outside of government leadership, either managing their own entities or taking roles as public intellectuals.

What is relevant to our discussion is not that these leaders display leadership that is not powerful but that they display different kinds of power than that displayed by heads of government. The leadership effectiveness of the leaders ranked as top in the greatness or thoughtfulness list are good examples of how vision and inspiration – two topics noted as outside the immediate focus in this entry – can promote styles of leadership effectiveness that measures on to the three Ps model of product, productivity, and probity.

One of the themes of this entry has been negotiated leadership. The model of leadership effectiveness we have highlighted notes the importance of leaders' rhetoric as they construct the enterprise they want with the team they value. Rhetoric might sound at odds with ethics but the three Ps model examined here rests ultimately on shared rhetoric about probity, with leaders and supporters agreeing that what they do and how they do it complies with public integrity – and can be publicly accountable for that compliance. Students of leadership have frequently noted this ethical quality to the rhetoric of leadership (Keegan 1987, pp. 54–59, 140–145; Toye 2013). Time now to have it acknowledged solidly in our models of leadership effectiveness.

# Leadership Failures

Valerie L. Patterson
Florida International University, Miami, FL, USA

## Synonyms

Leadership errors; Leadership mistakes

## Definition

When negative unintended consequences occur as the result of mistakes, errors, ignorance, lack of expertise, flawed communication, and inability to lead. The unintended consequences can have a minor or major impact on the organization being led, the public being served, and the surrounding internal and external environment. In some situations, the failures can lead to death and have a long-term catastrophic impact.

## Introduction

Richards and Engle (1986) offer the following definition of leadership "Leadership is about articulating visions, embodying values, and creating the environment within which things can be accomplished" (p. 206). This definition is useful for examining failures because failure is frequently associated with leaders who have not mastered communication skills, especially in conveying mission, vision, and goals, incongruent or conflicting values between leader and followers, and turbulence and conflict in both the internal and external organizational environment that thwart goal attainment.

Categorizing failure can be useful. Edmonson (2011) suggests that mistakes that lead to failure in organizations fall into three broad categories: those that are preventable, complexity-related mistakes, and those that are intelligent (in that valuable lessons are learned). She asserts that all failures then are not created equal.

Leadership failures reinforce the notion that leaders are not infallible and that they are human. Leaders, followers, and observers of the leadership process should know that failure is inevitable. Mistakes made by leaders can be huge in terms of subsequent impact and thus leave a historical mark. Thompson (2007) identifies this kind of failure as *catastrophic leadership failure*. These examples of leadership failure offer lessons learned that are useful for avoiding future failures if the lessons are heeded.

This entry will interrogate the meaning of leadership failures. Theoretical perspectives that explore failures attributed to leadership will be reviewed. Three examples of leadership failures in the public sector will be presented. Lessons learned from failure, strategies for mitigation, and useful ideas for avoiding mistakes from past examples of leadership failures will also be offered.

## Theoretical Perspectives

Hierarchical structures in government organizations can lead to difficulty in identifying, categorizing, and locating the nexus of leadership failures, even though the nature of hierarchy suggests otherwise. A hierarchical model suggests that the ability to locate the "leader" (and the blame) should be straightforward. But when things go very wrong in the public sector, the ethic of structure and the problem of "many hands" as argued by Thompson (1980) offers insight. Thompson argued because "many different officials contribute in many different ways to discussions and policies in the modern state [it] makes it difficult to ascribe moral responsibility to any official" (p. 905).

Bureaucratic hierarchical structures – which characterize many government organizations – are designed to work in environments where standard operating procedure is routine and where

predictable behavior can be applied. So bureaucracies historically have been modeled in a manner that approaches the complete elimination of personalized relationships and nonrational considerations. One attribute of bureaucracies as argued by Weber (1922) is the clearly defined rules precluding the necessity to issue specific instructions for each specific case. Weber sought to conceptualize an organization that would be free of emotional reactions and other types of irrational behavior.

However, leaders heading twenty-first century bureaucracies and charged with decision-making responsibilities are operating in an environment that is increasingly characterized by chaos and turbulence and their external environments extend beyond cities and states – are far more global than their predecessors – creating an increased potential for unexpected or unpredictable events to occur. These unexpected results frequently fall under the category of negative unintended consequences and may be identified as leadership failures. Merton (1936) discussed five different ways the actions of entities that make large scale decisions can have unintended consequences that can be positive, negative, or neutral – the identified causes are ignorance, error, immediate interest, basic values, and self-defeating prophecy. When leaders lose focus or have not adequately prepared for their leadership failures occur. Some failures are major and have catastrophic effects (for example, human casualties result); astute leaders pay close attention to these kinds of failure and process the lessons learned to avoid repeating them.

Leadership theory has examined traits (in what ways do leaders differ), style (examining the actions of leaders), contingency (the impact of circumstances), leader-member exchange (what occurs in the leader-follower relationship), and transformation (how are followers transformed by leaders). Theories on effective leadership abound. Leaders motivate, guide, direct, create visioning, and inspire followers. Failure can occur when these leaders do not make these things occur.

Leaders are important and in organizations are expected to behave in a manner that fosters high performance in meeting organizational goals. An iconic pop symbol was adept at pushing band members to the point where they exceeded what they felt were their artistic limits; effective and successful leaders motivate and develop their followers in this way. Clearly one of the hallmarks of leadership is for the leader to be expert enough, persuasive enough, and charismatic enough to convince others to follow. Leadership failures occur because expertise and charisma given current complexities are insufficient for meeting today's challenges. Leaders need other attributes like influence as well.

Exploring effective leadership is useful for thinking through leadership failure. Effective leaders are flexible and adaptive as these are skills that are essential for managing in organizations and especially for managing crises (Yukl and Mahsud 2010). Yukl and Mahsud argue that leaders are confronted with different situations that require different styles, thus effective leaders possess proficiency in using a wide range of diagnostic skills. Some situations require decisive action in unusual circumstances, and one example of leadership failure is an inability to respond in a decisive manner. Leaders who have limited knowledge and technical expertise fall in this category.

## Emotional Intelligence

Leadership failures reveal the challenges leaders face when they are required to make decisions that challenge their inability to know all and be all. Emotional intelligence is a necessary element of successful and effective leadership and connotes a leader's ability to be aware of both self and others, especially in handling emotions and relationships. It has been defined in the literature by Mayer and Salovey (1997) as follows "Emotional intelligence is the ability to perceive emotions, to access and generate emotions so as to assist thought, to understand emotions and emotional knowledge, and to reflectively regulate emotions so as to promote emotional and intellectual growth." Successful leaders are adept at combining their cognitive ability with their emotional intelligence to address workplace challenges. This leadership

competency is necessary across all levels of decision-making.

## Catastrophic Leadership Failure (CLF)

As stress level rises, cognitive ability is impacted. Thompson (2007) argues that leaders who fail to continually develop their cognitive abilities *and* their emotional intelligence place themselves and their organizations at risk for catastrophic leadership failure.

When a leader's stress level is elevated beyond a certain point, the ability to maximize the use of both cognitive ability and emotional intelligence to make decisions that are both timely and effective is placed at risk and adversely impacted (Thompson 2007). These kinds of decisions can be recognized as characterized by fear, defensiveness, denial, and over-analysis.

## Other Important Elements

Mittelstaedt (2005) suggests that "the three biggest causes of failures are not believing data, disregarding new phenomena, and not taking responsibility for problems." McCorkle and Witt (2014) argue that counterproductive communication habits on the part of the leader are a harbinger of additional pitfalls that are sure to follow. Zwilling (2016) also asserts that "effective leadership requires effective communication, including verbal, written, and body language." Micromanagement can lead to failures as the growth and expertise of followers may be stifled. Over-management can result in leadership failures because the leader fails to trust in the expertise of followers and does not delegate.

## Noted Examples of Leadership Failures in Government Organizations

One approach for examining leadership failures is to review examples. There are several more recent examples of failed/flawed leadership in government organizations that are useful for considering this topic. Failed leadership in government organizations can have a disastrous impact and cause the further erosion of public trust and confidence. While there are others, three twenty-first century examples that seem particularly useful are – the handling of the 9/11 terrorist attack in New York City in 2001, the Hurricane Katrina disaster in New Orleans in 2005, and the death of Michael Brown in Ferguson, Missouri, in 2014. The examples that follow should not be viewed as a comprehensive exploration and assessment of leadership failures. They are offered as brief summaries that should be explored to provide additional insight and understanding of leadership failures occurring in public organizations.

## September/11/2001

An exploration of leadership failures related to the September 11, 2001, reveals criticism directed to multiple leaders of government agencies, particularly leaders of intelligence agencies in the USA. Reflections and critique point to failure to develop and/or implement a comprehensive strategy for combating terrorism, failure to delegate authority, failure to act on critical information, and failure to develop a coordinated response to acquired vital information at the highest levels of intelligence and defense agencies. Other leadership-centered failures include failure to coordinate human resources and the failure associated with the creation of a massive, cumbersome bureaucracy in the form of the Department of Homeland Security (DHS). DHS combined 22 agencies that are at times dysfunctional because of the unwieldy form of this department.

Reflections from 9/11 for leadership lessons cannot be considered without linking and incorporating the "War on Terror." This war that continues some 15 years later further highlights leadership failures of key decision makers. Multiple American military campaigns, deaths of innocent civilians and military personnel, limited healthcare and mental health treatment afforded to returning US veterans, Abu Ghraib, Guantanamo detention, global anger, global unrest, and subsequent domestic and international

acts of terror are the outcomes and reflect the negative unintended consequences that can occur.

## Hurricane Katrina in New Orleans

Leadership failures related to Hurricane Katrina can be found on the federal, state, and local levels of government. Some argue that the response to Hurricane Katrina reflects an inability on the part of government leaders to learn the lessons from 9/11. Leaders across all levels engaged in behavior that is counter to effective leadership. One failure with a cascading impact was poorly executed decision-making at the highest levels of federal government. The placing of inexperienced people who lacked important qualifications is identified as a leadership failure that occurred. Government leaders failed in their ability to assess the potential magnitude and impact of the storm and were unprepared to make timely decisions and coordinate a response as required by the disaster that resulted. Leaders at the local and state levels demonstrated a superficial and incomplete knowledge of historically marginalized and disadvantaged communities in the city of New Orleans, leaving thousands vulnerable and unable to evacuate. The inability of government leaders to rise above political and partisan interests before, during, and after Hurricane Katrina is also identified in the literature as an example of leadership failure. Leaders at the highest levels used politics and partisanship to center their actions and reactions to the events that unfolded before and after Hurricane Katrina. The literature reveals that failures occur when the wrong people are chosen to lead organizations. In the case of Hurricane Katrina, finger-pointing, blame placing, and political survival were given primacy over finding solutions and alleviating the pain and suffering of residents facing dire circumstances in the aftermath of the storm. One frequently noted leadership failure at the federal level was the appointment of an agency director who lacked expertise in emergency management. This director was not prepared to motivate agency personnel or offer direction in achieving emergency management goals. He failed to demonstrate the most rudimentary capacity to direct and lead the federal response, an essential charge and responsibility of the agency he headed.

## Civil Unrest and the Death of Michael Brown in Ferguson, Missouri

A more recent example of failed leadership across multiple levels is the response of law enforcement agencies, elected leaders, and government officials to protests and civil disobedience in the shooting of Michael Brown in Ferguson, Missouri, in August 2014. The initial obvious circumstances of Brown's death – unarmed with his body left uncovered in the streets for a reported four hours – immediately resulted in community protests. Failed leadership manifested itself in myriad ways, and the constitutional rights of protestors were violated. Similar to the other examples presented in this entry – government officials across multiple levels (this time local, county, and state) failed to communicate and coordinate their response to the unrest; when communication occurred the messages were disjointed and conflicting; police officers used military equipment (like tanks and drones) that they had not be adequately trained to use to dispel protests; excessive force was used against protesters; and active violation of the constitutional rights of protestors by law enforcement occurred.

Brown's death focused attention on the absence of diversity among higher ranking public officials in a town that was predominantly African-American. Brown's death and the resulting civil unrest led to a subsequent Department of Justice (DOJ) investigation that exposed troubling policy and practices that disproportionately impacted poor black people in Ferguson. City leaders were aware of and encouraged law enforcement efforts focused more on maximizing revenue than ensuring safety for the citizens, especially those residing in the black community. The Department of Justice issued a report in March 2015 that detailed "a pattern or practice of unlawful conduct within the Ferguson Police Department" (p.1). In the year 2013 alone, 9,000 warrants for minor violations were issued,

deemed disproportionate for a city the size of Ferguson. The DOJ investigation determined that two-thirds of Ferguson's black population had received warrants. Ferguson's leaders created a culture that encouraged and rewarded the writing of citations and the collection of fines to increase city revenue, a practice that created a dependency on the collected revenue. These warrants were issued for the arrest and incarceration of people who were financially vulnerable and unable to pay the fines, and their incarceration created additional vulnerabilities, poverty, and marginalization.

The DOJ investigation found the police leadership did little to ensure that officers under their supervision acted in accordance with law and policy. The pattern of stops conducted by law enforcement in Ferguson was characterized by many First and Fourth amendment violations.

## Cultural Competency and Leadership Failure

Hierarchical leadership models are limiting in today's organizations. A singular view of leadership that is grounded in the predominant use of authoritarianism and patriarchy can be linked to all of the examples of failures at the highest levels presented in this entry. The ever-changing dimensions of diversity in the twenty-first century and their complex nuances require leaders who are adept at understanding the impact of cultural competence on leadership effectiveness. Leaders who embrace styles that are insulated and parochial are destined for failure. Useful research acknowledges that some leadership characteristics seem universal across multiple global societies – trustworthy, just, honest, and decisive. How these traits are performed across multiple societies may differ however (Hoppe and Eckert 2011). Leaders should start from and ground cultural competence in their responses and interaction with subordinates, peers, clients, the public, communities, and other important stakeholders. To avoid failure, leadership must be inclusive and open to diverse ways of knowing, thinking, and being.

## Lessons Learned

Light (2014) examines what he identifies as a cascade of government failures and ranks them by news interest. Two of the examples presented in this entry are ranked 1st and 3rd based on the news coverage generated. While Light does not specifically identify each as a leadership failure, he does identify leadership as one of the contributing factors to failures in government and argues – "Government's top appointees might have been unqualified to lead; could have made poor decisions before, during, and after the failures appeared; or might have taken their posts after long delays created by the presidential appointments process" (p. 11). He asserts that one of the first steps in reducing failure is to ensure that vision, delivery, and their intersections are considered "at every stage of the policy process" (p. 23). Lessons learned from failure should be embraced and acted on. Failure should force introspection and reflection in leaders. Leaders of public organizations must understand that a universal lesson is if you break something, you should fix it. Across the three examples presented in this entry, it is clear that failure should lead to more collaboration and communication among principals and less finger-pointing and blaming. Public leaders should serve their constituencies and not themselves.

In one exploration of the things that successful leaders do in a crisis, Newlands (2014) found that failure should not be taken personally. This means leaders should take tangible steps to ensure that when similar situations occur different steps are taken. Effective leaders learn from failure. Several experts advocate the use of transformational leadership. Northouse (2016) (while acknowledging and documenting weaknesses) argues that "transformational leadership appears to be a valuable and widely used approach" (p. 190). In terms of effective approaches, Yukl's (1999) research offers evidence that the transformational model of leadership is effective. This argument is supported by research which demonstrates that the transformational approach to leadership "was positively related to follower satisfaction, motivation, and performance (Northouse 2016).

Emotional intelligence is touted as essential to successful leadership. The importance of awareness and honing of a leader's emotional intelligence is a lesson that is learned from the exploration of leadership failures.

Leaders can avoid failure by realizing that leadership is a constant process that involves commitment to learning and relearning (Bennis and Nanus 1985) whether focused on intellectual, social, or emotional intelligence.

## Conclusion

This entry has examined leadership failures and offers a brief overview of examples of failure, important elements of failure that are explored in the literature, lesson learned from failure, strategies for mitigation, and useful ideas for avoiding mistakes from leadership failures of the past.

# Leadership Group Coaching

Katharina Balazs
ESCP Europe Business School, Paris, France

## Synonyms

Executive coaching; Group executive coaching; Leadership coaching

## Definition

Leadership group coaching is a process by which one or several executive coaches provide help to executives in a group setting, enabling these executives to develop their own leadership skills through increased self-knowledge, self-development, and feedback and thus to contribute to the success and sustainability of their organizations.

## Introduction

In this chapter, we will look at the difference between individual, one-to-one executive coaching and group executive coaching and explore the benefits of the latter as compared to the former. Then we will explore the journey of group executive coaching in more detail – the preparation phase, the coaching process, and its follow-up. We will explore both the measurable and the implicit outcomes and impact of both the individual and the group executive coaching process. Finally, we will take a closer look at the role of the coach in the process, the kind of preparation that is required of an effective group coach, and the possible pitfalls that can harm the coaching process.

## Why Executive Leadership Coaching?

The last years have seen a sharp increase in the demand for executive leadership coaching in the business world. Corporate America, for example, is spending more than $1 billion annually on executive coaching (Symonds 2011). While coaching used to be associated with less than optimal performance, with executives being offered coaching as a last resort – and in utmost secrecy – before being definitely considered unsuitable for their organizations or their positions, today having a personal leadership coach has become a privilege accorded to the best performers and highest potentials in the organization. According to the Ridler Report (2013), an internationally reputed research project on coaching, which analyzes strategic trends in the executive coaching field based on extensive data, 83% of those questioned about why executives received coaching said that the first and foremost reason was the coachee receiving significant additional developmental investment because of them being highly valuable for the organization. Only 10% indicated that the reason executives were offered coaching was significant underperformance. Thus, for today's executives, having one's own coach has become a sign of prestige, with every self-respecting executive demanding one.

This brings about the question: why has coaching gone from warning sign to reward? The answers are manifold. For many organizations, what was an effective way of running the business a few years ago is no longer valid today, and competencies and skills that were the cornerstone of an executives' repertoire have become obsolete. This creates relentless pressure for today's leaders, requiring them to concentrate on long-term, strategic thinking, while at the same time producing outstanding results in the short term.

Another reason for the importance that executive coaching has taken on has to do with the change in organizational cultures and leadership styles during these past years (Kets de Vries 2005). Organizational structures have become flatter, more spread out – sometimes globally -boundary-less and often virtual. The old model

of command and control leadership has become ineffective in these kinds of structures, where power has been replaced by influence resulting from unique skills, the right kind of network, and global/cross-cultural knowledge. These new organizational forms put high demands on executives' emotional intelligence (EQ), interpersonal skills, and relationship management. Given the extent to which business education has put the emphasis on hard skills, many of these softer skills are in short supply in today's organizations. Executive coaching can address the lack of these skills and help in developing them.

Last but not least, the ever-growing legal and corporate governance demands are contributing to executives' sense of insecurity and disorientation. This, when they complain of "having nobody to talk to," has become a dire reality to many executives who realize that the higher they are in the organization, the more difficult it becomes to exchange with others about their concerns. Executive coaches are thus becoming the preferred sparring partner, as they have often both extensive business experience and are thus familiar with the issues executives face, but are, at the same time, as outsiders, more "neutral" than colleagues and superiors within the organization.

For the organization, executive coaching can be used as a remedy for many ills: as a way of retaining and developing high potentials, a learning opportunity, and also as a preventive measure against burnout and stress. It provides executives with the opportunity for continuous learning and with ways of self-renewal and coping with tough situations. As a result, and given that organizations and executives have become keenly aware of the value of coaching both on the individual and the organizational levels, the coaching market has become a multibillion-dollar enterprise, with leadership coaching having become a major activity for large consulting firms, as well as small, boutique coaching providers, and also constituting an integral part of most executive education programs of leading business schools.

As a first step, let us start by examining the distinction between individual and group coaching processes.

## What Is Group Executive Coaching and Why Is It Successful?

In today's organizations, we mainly find two kinds of coaching processes: one-on-one coaching and small-group coaching.

One-on-one leadership coaching can be considered as a cocreation process between the coach and the coachee, in which the coach supports the executive to reach a mutually determined goal, which can contain anything from the willingness to delegate more to mastering a successful leadership transition and even to acquire better strategic thinking. This kind of coaching can be very effective when it is conducted over a certain amount of time (often 3–6 months) with one to two sessions a month. On the downside, the outcome is dependent on the chemistry and relationship that develops between coach and coachee, and what is more, the coachee is confronted with only one point of view.

Leadership (small) group coaching, on the other hand, is a very effective alternative to individual coaching, one which is more likely to result in durable changes in leadership behavior. This kind of coaching, as opposed to one-to-one coaching, is most often part of a broader executive development program in business schools. Groups are made up of a small number of (3–6) executives who are either from different companies participating in open enrolment programs or participants of a customized company-specific program. In this later case, the participants either come together from across the whole organization, functionally and/or geographically, or can also be members of the same department, and even the entire top management team, if the goal is to create a better-functioning team.

Group coaching is an intervention approach pioneered by professor Manfred Kets de Vries from INSEAD's Global Leadership Center (IGLC) in 2003. He was the first to successfully develop a clinically oriented psychodynamic group coaching process for leadership development, providing participants with accelerated, experiential learning in leadership skills. Kets de Vries, a psychoanalyst as well as a business school

professor, created a methodology called the clinical orientation, which is solidly grounded in concepts of psychoanalytic psychology, short-term dynamic psychotherapy, cognitive theory, human development, and family systems theory. This approach can be extremely powerful in deciphering and providing solutions to deep-seated leadership and organizational issues that do not lend themselves to traditional organizational change interventions (Van den Poel and Ward 2015).

The advantage of the psychodynamic approach is that it allows and encourages participants to take time to reflect on their own functioning, motivational forces, strengths and development areas, and the underlying reasons for their successes and failures. In today's turbo-charged organizations, where the constant need to act does not leave any time for self-reflection, being able to reflect and talk about oneself, one's personal history and timeline, and explore issues until then left unexplored in a safe, noncompetitive environment creates a sense of meaning participants have often been missing in their quest for the next milestone.

The group members' role is crucial in this process. They listen, reflect, ask questions, and raise challenges to each other, creating a sense of emotional engagement that is very unusual after such a short time spent together. One of the forces of group coaching that comes from this kind of interaction among group members, and which is entirely absent in one-to-one coaching, is the extent to which participants recognize themselves and their own personal challenges in the others. From having had the perception of being the only one with their particular questionings, they undergo a process of sharing and bonding, which, in the end, helps them to increased self-acceptance and appreciation.

The success of the leadership group coaching method is illustrated by the numbers: from being an entrepreneurial start-up venture, the INSEAD Global Leadership Center counts over 100 group coaching interventions a year, working with a global network of 100 executive coaches and providing coaching to over 4000 executives every year. As these outcomes suggest, small-group coaching has unique advantages and is an accelerator of leadership development at the individual, team, and organizational levels, while offering a more cost-effective alternative of tackling major individual and organizational challenges (Van den Poel and Ward 2015).

In the following, we will look at how concretely the group coaching "journey" works, from the preparation phase of the process to the follow-up and its concrete outcome and results.

## The Group Coaching "Leadership Journey"

### Preparation

Psychodynamically oriented group coaching work has a strong action-learning component, so it is important to do some diagnostic work up front to identify key issues executives face. This will allow to set priorities and the focus for the interventions. Thus, the group coaching process starts with participants reflecting on their own leadership styles and patterns. To support this reflection, participants are asked to complete a proprietary – and entirely confidential, with access granted to the coach dedicated to the participants' specific coaching group only – global 360-degree feedback questionnaire.

The questionnaire is adapted to goal of the intervention: when the goal is the exploration of strategic leadership issues, most often the GELM (Global Executive Leadership Mirror) is used, as it covers the entire range of issues executives face. When addressing top teams in companies, a specific team-oriented 360 questionnaire, the LAQ (Leadership Archetype Questionnaire), is used. When assessing the organizational culture of companies, the OCA (Organizational Culture Audit) questionnaire will be the one best suited for the purpose. And sometimes, corporate clients insist on using their own, 360-degree feedback. Experienced group executive coaches are certified in many of these instruments and are skilled in adapting to and using even those they are not familiar with. It is important to point out that the questionnaires do not constitute an assessment of participants' skills, competences, or potential but are uniquely used as a basis for creating a

personalized leadership development approach for each individual executive.

To complete the whole picture, participants are asked not only to fill in the questionnaires themselves but also to select a number of observers who do it for them: superiors, peers, and direct repots, as well as people from outside their professional peer group, for example, partners or adult children. This measurable, quantitative feedback, provided by self as well as outsiders, is combined with qualitative feedback from participants' personal environment, as well as a detailed biography of each participant. All material is then provided to the group coaches, helping them to prepare for the coaching intervention and acquire a certain familiarity with the participants from multiple points of view.

### The Coaching Process

Group coaching workshops typically take 1–2 days, depending on the group size. Groups of four to six work best, facilitated by the professional coach. The workshops are structured to transition participants into an atmosphere conducive to this work, then, when the necessary trust is present, conduct a 1–1.5 h session with each participant, after which participants will be helped to transition back to their daily lives. Based on their feedback instruments and other exercises, participants engage in a discussion of their feedback facilitated by their executive coach and with the other participants present, with the facilitators inviting other participants to share their views as well where appropriate.

In more in-depth versions of this group leadership process, the leadership coaching is spread over two modules of the executive program with one or more full coaching days in each module. Certain programs follow-up with individual one-on-one coaching, on others, the coaching day is preceded by a day of outdoor experiential learning exercises, constituting yet another source of valuable feedback material about the participants (Van den Poel and Ward 2015).

As an important part of the workshops, participants work with the coaches and the rest of the group to elaborate individual leadership action plans, with action items related to business and personal objectives, which are to be implemented during the 3–6 months after the coaching day. At the end of the day, participants commit publicly to their action items and are held accountable by other members of the group for their progress through a process called peer coaching, which entails regular contact and support between group members. The main goal of the after-group period shifts from applying lessons learned about one's own individual leadership style to applying these skills to team and organizational leadership.

### Follow-Up

In order to ensure that the insights and learning points of the coaching create a lasting effect in participants' lives, at least one follow-up of some kind is essential. This can be one or several group conference calls with the coach a few weeks after the coaching day, or one or more follow-up calls with one's peers or with the coach 1–2 months after the program, the goal being to support the participants in implementing their leadership action plan (Kets de Vries 2015).

### Outcome and Impact

Given the nature of coaching, namely, that it targets first and foremost individual human beings' internal processes – which then impact organizations – it is not surprising that the value of coaching for organizations has been hard to measure. Attempts have been made to measure the "ROI" of coaching from both a quantitative and a qualitative point of view: the Global Coaching Report of the International Coaching Federation suggests an analysis of the benefits of coaching based on two performance metrics – one to measure return on investment (thus, its monetary benefits) and the other to measure return on expectations (coaching's nonmonetary benefits) (ICF 2009).

Looking at the impact of coaching from a quantitative, point of view, several sources point to considerable benefits. According to the Global Coaching Report of the ICF mentioned above, when asked if they or their company had experienced any financial changes (gains or losses) as a result of coaching, 40% of clients indicated that a

positive financial change had occurred, while 19% were unsure. The key findings of this study on individual and company ROI are the following:

- Individual ROI: 68% of individuals indicated that they had at least made back their initial investment.
- Company ROI: 86% of those able to provide figures to calculate company ROI indicated that their company had at least made their investment back, with 19% of them indicating an ROI of at least 50 times the initial investment and a further 28% indicating an ROI of 10–49 times the investment.

Another source, a recent global survey by PriceWaterhouseCoopers and the Association Resource Center described in Forbes (Symonds 2011) puts the mean return on investment in coaching seven times the initial investment, with more than 25% of coaching clients reported a ROI of 10–49 times the cost.

In terms of return on expectations – i.e., non-monetary outcomes – the key findings of the ICF study were the following:

The vast majority of clients indicated being very satisfied with their experience. Ninety-six percent of clients indicated that they would repeat the coaching experience given the same circumstances that lead them there in the first place. The main benefits of the coaching process were described as being heightened self-esteem/self-confidence (80%), better relationships (73%), increased communication (72%) and interpersonal skills (71%), higher work performance (70%), better work/life balance (67%), and wellness (63%).

On a personal level, the most observable benefits experienced by executives as a result of their leadership coaching journey can be found both in the short and in the longer terms: the former is most evident when executives work on a very specific behavior at reentry, for example, "better listening" or "delegating more." The latter, longer-term effect kicks in during the first weeks and months after reentry. Coming out of the coaching process with heightened self-awareness, executives will experiment with a new leadership style, which over time will create a deeper level of change in their leadership identity, thus having an effect on followers' perceptions and behavior. This, in turn, will have a long-term influence on a number of aspects of the organization's culture and strategy, with the coaching process thus resulting in a virtuous and self-reinforcing circle of positive change (Kets de Vries 2005).

It becomes clear from these studies that executive coaching can have considerable, even measurable impact. Let us now take a look at how and why group executive coaching differs in impact from one-to-one coaching.

In group coaching situations, there are a number of forces of change that increase the likelihood that participants will go through more lasting development. One of them is the abovementioned effect of the group coaching setting providing participants with a considerable dose of hope, as a consequence of noticing how the other people in the group are making better choices in their lives. Also, as mentioned, being part of a group of people with similar backgrounds and experiences helps the participants recognize that what they are going through is universal and that they are not alone in their confusion. Furthermore, the members of the group will be able to help each other by sharing information and strengths and by providing mutual support to each other, thus boosting their self-confidence. In addition, the group provides participants the opportunity to explore and experiment with new behaviors without too much risk, as it is a comfortable setting to practice behaviors that could turn out to be destructive or unhelpful in real life. By interacting with other people and receiving feedback from the group and the coach, each individual can gain a greater understanding of him- or herself and learn what works and what doesn't when it comes to their leadership style and functioning. The setting and support also help the participants realize that they are responsible for their own lives, actions, and choices. None of these factors are present to the same extent in one-to-one individual coaching.

Having described the coaching process and its outcomes, it is important to say a few words about the person whose role is crucial to the process and its success or failure: the executive coach.

## The Coach

In this final part of our chapter, we will look at the role of the coach in a small-group setting. The way the coach handles not only the group, but also him- or herself can make or break a group coaching experience. There are many traps that group executive coaches need to be aware of in order to help executives get the most effective coaching experience.

The majority of executive coaches subscribe to two main streams of thought. These can be summed up as the *psychodynamic* and the *cognitive-behavioral* approaches. While the first orientation pays a considerable amount of attention to the client's past history (exploring the reasons for present-day problem behavior) as a basis for creating change, the second one disregards the past entirely, to focus on challenges that need to be taken care of in the present and in the future.

Both forms of executive coaching can be successful in accomplishing the same thing: to help executives that struggle with contemporary issues in their lives – to help them function more effectively. The choice of one approach or the other very much depends on the coach's training, style, and personality. Some coaches use only one approach with all their clients, while others tailor their approach based on a particular client's needs, symptoms, and personality, mixing and matching the two approaches for maximum results.

The essence of the two approaches is the following (Kets de Vries 2005): conceptually, coaches who prefer the psychodynamic approach try to help executives acquire increased self-knowledge and a deeper understanding of their relationships with others. To accomplish this task, they pay attention to the fact that a great deal of human behavior is unconscious. Furthermore, they also take into consideration that one's personal history deeply impacts the way they think, feel, and act in the present. Thus their main focus will be to find the hidden feelings and motives that participants have – to resolve unconscious conflicts as shown in present behavior. To discover these links, psychodynamically oriented coaches make a great effort to explore how events that have happened in early life have affected the way participants feel about themselves, how they relate to others, and how they deal with their and others' emotions. Through the examination of these unresolved conflicts (that are results of dysfunctional relationships from the past), they help their clients acquire a greater understanding of the influence of the past on present behavior – they help them to become more conscious of their unconscious thoughts, feelings, and motives. This kind of understanding will help coaches realize which aspects of those problems they may be able to solve or improve. In this journey of self-exploration, the coach will aid their clients to learn how to take greater control over their lives and respond to challenging situations with healthy coping skills.

The underlying concept behind the other prevalent approach to coaching, the cognitive-behavioral approach, is that thoughts and feelings play a fundamental role in human behavior. Coaches who follow this method suggest that change happens when participants overcome their difficulties by identifying and changing dysfunctional patterns of thinking, behavior, and emotional responses and acquire new coping techniques and problem-solving skills. Thus what these coaches do is making a great effort to help their clients recognize maladaptive thought patterns and behaviors and correct them through conscious effort. The ultimate objective is to make clients understand that while they can't control every aspect of the world around them, they can take control of how they interpret and deal with things in their environment. This approach is more focused on the "here and now" compared to the psychodynamic one and does not devote much attention to the reasons of maladaptive behavior.

## The Pitfalls of Group Coaching

Psychodynamically oriented leadership coaches draw heavily on psychotherapeutic frameworks and skills. In leadership coaching, as in psychotherapy, there may be a discussion (depending on how deep the leadership coach and the client are willing to go) of blind spots, defensive reactions, and irrational thoughts. Thus, whatever depth the

leadership coach and the client is prepared to go to, it is important to be prepared for emergencies in the coaching process, and coaches need to recognize the danger signs that can derail it.

For these reasons, effective and constructive leadership coaching is built on a solid base of psychological understanding and practice. Particularly in the case of group interventions, it is essential that the leadership coach has had some clinical training; otherwise, he or she will not be able to decipher dysfunctional group dynamics and individual pathology. Ideally, aspiring leadership coaches undergo clinical training to prepare them for the kind of deep-seated psychological problems that can derail the leadership coaching process. This kind of training starts with the coach becoming aware of his or her own psychological issues, which, left unexplored, will infiltrate and contaminate the coaching process. Only those leadership coaches, who have had some training in psychological techniques and methods, in combination with intensive experience of life in organizations, are equipped to be most effective in the domain of group executive coaching. Coaches who are lacking training and experience in these two fundamental areas are likely to do more harm than good. Because the leadership coaching process often awakens deep-seated psychological problems, raising issues that need much more than a simple coaching intervention, leadership coaches who do not have solid psychological training are woefully unequipped. A leadership coach's inability to recognize such problems, or the tendency to downplay them, can have detrimental results for individual and organization.

## Conclusion

As we have seen in this chapter, while individual, one-to-one coaching can be very effective, group executive coaching brings some distinct advantages to the individual coachee, the group, and the organization, with both measurable and implicit benefits. As the constant changes in organizational practices and processes put increasing and new types of pressures on leaders, executive coaching – and in particular group executive coaching – has shown to significantly contribute to executives managing the growing pressures. Looking at the way the practice of coaching has expanded from last-resort solution to a global industry in a matter of a few years, it seems fair to say that group executive coaching as an effective executive development tool is here to stay.

## Definition

Leadership is the act of engaging others to pursue activities toward a specific goal. Organizational leadership involves engagement that supports goals that enhance the state of the organization.

## Introduction

Leadership is not one approach and studying leadership is not an exact science. Definitions and explanations have varied over time. More importantly, organizational leadership style needs to vary to accommodate individual skills, organizational mission, and environmental factors.

Dwight D. Eisenhower, who was the Supreme Commander of the European Allied Forces during World War II and the 34th President of the United States, said that "Leadership is the art of getting someone else to do something you want done because he wants to do it . . ." In Eisenhower's view, leadership is essentially about motivation and interaction with others (Eisenhower 1954). Many years before, Max Weber studied leadership in which he noted that the authority of leaders comes from three sources: charisma (force of personality), traditional authority (organizational structure), and legal-rational authority (rules and regulation). From Weber's perspective, leadership is about situation (Weber 1978). Putting these two views together, leadership within an organization encompasses two elements: the leadership situation and interaction with others.

## Leadership Situation

Beginning with the situation perspective identified by Weber, Dartey-Baah reviews three leadership types, two of which fall into the situational category. Transactional leadership involves a transaction-based reward system, passive management so that employees have space to carry out functions and active management only when there is a deviation. This leadership approach functions best in a stable environment (Dartey-Baah 2015). Aviolo et al. add transactional leadership which involves exchange of rewards for performance (Avolio et al. 2009). Kellis and Ran conclude that as public service evolves into a collection of different organization types providing service, the traditional transactional leadership style loses its power (Kellis and Ran 2013).

Dartey-Baah's second situational leadership type is resilient leadership. Resilient leadership involves first-rate performance against goals. This performance responds to a situation in which market and technology are changing and success is achieved through innovation. Resilient leadership requires emotional intelligence from the leader who needs to keep the work force focused on organizational goals during turbulent times. While Dartey-Baah notes that situational leadership types generally focus on ensuring compliance with established procedures, because of the unsettled environment of the resilient leader, deviation from established procedures is a possibility (Dartey-Baah 2015).

## Leader Interaction with Others

As Aviola et al. note, the perspective on leadership has changed over time. Leadership is now described in dynamic terms such as shared, relational, and strategic. The leadership literature now focuses on holistic and positive forms of leadership with an emphasis on causality between leadership, impacts, and outcomes. The follower has become more important in the system. Researchers see leadership as complex, distributed, and shared with alternate leadership approaches such as E-leadership (i.e., leadership using technology to manage dispersed individuals and groups) becoming more prominent (Avolio et al. 2009).

Consistent with the movement to more interactive, contextual leadership, Althaus uses a metaphor approach in talking about the effects of leadership on organizations. She identifies three useful metaphors (i.e., mandarin, executive, and Sherpa) concerning those who exercise leadership in influencing those who govern. She suggests that the Sherpa is the most effective metaphor for the public sector, although the executive

metaphor is most prevalent in modern times. Below is her explanation of each metaphor.

- Mandarins are elite and lead from position, often a birthright position. They are small in number and connect with those in power through family, class, culture, and the same schools. Mandarins are advisors to top officials and do not necessarily hold official positions. They are small in number and often do not interact directly with bureaucrats but rather provide their advice directly to the top elected or politically appointed official.
- Executives are top bureaucratic officials who assist rather than advise top elected or appointed officials. Executives tend to be goal-oriented, dominated by the execution process, encouraged by performance incentives, and focused on the interests of the elected official.
- Sherpas lead through team work and act as the representative of the leader in the facilitation of the team. They build on the work the organization has already completed and take the position that the leader cannot lead without the help of the follower. In addition to their focus on teamwork, Sherpas emphasize experience, goal creation, and environment. They obtain their power from their superior skill and knowledge; however, to maintain power, they must continually demonstrate this skill and knowledge. Sherpas have a common goal with the political official, blend into the background, and see their role as subservient to the political official (Althaus 2016).

Dartey-Baah also addresses leader interaction with others when he discusses transformational leadership. This leadership type encompasses both a holistic and an individualistic attainment of group goals. The leader communicates through inspiration and works to advance the leadership abilities of employees. The purpose of transformational leadership is to share organizational goal responsibility with employees (Dartey-Baah 2015). Aviolo et al. add that transformational leaders go beyond self-interest to inspire performance beyond normal expectations. The transformative leader often is charismatic, visionary, inspiring, and ideologically motivated (Avolio et al. 2009). Kellis and Ran note that relational leadership ideas include idealized influence, inspirational motivation, intellectual stimulation, and individual consideration (Kellis and Ran 2013). In this context, Ljungholm concludes that transformational leaders use networks and pay attention to external challenges while crowdsourcing solutions with employees and other interested parties (Ljungholm 2014).

Additional authors address interaction between leaders and others. Mary Parker Follett first identified shared leadership as a situation in which team members lead each other (Follett 1924). In discussing complexity leadership, Aviolo et al. suggest that in addition to follower behavior, the leader must look at the entire organizational context to determine which leadership approach (i.e., adaptive, enabling, and administrative) is best (Avolio et al. 2009). Arena and Bien point out that complexity leadership also involves unleashing organizational capacity and the need to change from a focus on human capital to social capital. This requires adaptation and innovation in response to the pressure and opportunities (Arena and Uhl-Bien 2016).

Levay defines the charismatic leader as one who has power because the followers see the leader as extraordinary, especially gifted, and inspired. She adds that charismatic leaders arise in change environments and such leaders can both support and resist change (Levay 2010). Wright et al. suggest that charismatic leaders articulate a strategic vision, often take personal risks, and engage in unconventional behaviors to motivate followers (Wright et al. 2012). Zehir et al. note a positive connection between charismatic leadership, ethical climate, and organizational citizenship behavior. When a charismatic leader models ethical behavior, organizational members are motivated to follow ethical policies and establish helpful relationships (Zehir et al. 2014).

Greenleaf first identified the concept of servant leadership (Greenleaf 1991), and Spears notes that servant leadership includes the following characteristics: listening, empathy, healing, awareness, persuasion, conceptualization, foresight,

stewardship, commitment, and guiding community (Spears 2004). These are all values that motivate others to participate in the leader's goals. Lord and Brown note that leaders connect their self-concept to followers and make their values relevant to the situation (Lord and Brown 2001). Milakovich and Gordon discuss relational leadership in which leaders work together with others to develop a common collective meaning about the work. They note this approach makes everyone accountable for outcomes and encourages customer service (Milakovich and Gordon 2013).

Ethical leadership uses elements of charismatic and servant leadership to cultivate the relationship between the leader and those being led. Cooper and Wright note that ethical leaders avoid the easy way out and focus on honor and style (Cooper 1992). Hassan indicates that ethical leadership involves an ethical role model, fair treatment of others, and management promotion of ethical norms. He identifies benefits that include development of a sense of ownership and provision of a sense of autonomy for employees. Hassan notes that ethical leadership provides a safe environment for employees, and he adds that performance improves and employees exercise voice when employees function in an environment of ethical leadership. Still ethical leadership does have potential drawbacks. Hassan identifies two potential negative consequences: higher risks perceived by minorities for exercising voice and a bias by supervisors against subordinates that exercise voice (Hassan 2015). Aviolo et al. add that ethical leaders promote norms to other stakeholders through their personal actions and interpersonal relationships (Avolio et al. 2009).

Leadership involving interaction with others is the area that continues to draw researcher interest, and many additional types of interaction-based leadership are being explored – too many to cover in a short article. However, a few examples give some sense of the work being done in this area. Doig and Hargrove note that entrepreneurial leaders have unusual drive and use rewards and sanctions to build coalitions that achieve large goals (Doig and Hargrove 1987). Aviolo et al. suggest multicultural leaders working in environments with multiple cultural contexts require cross-cultural knowledge and sensitivity. They note that cognitive leadership involves an emphasis on leaders understanding how followers think and process information. They also highlight authentic leadership which involves transparent and ethical leader behavior (Avolio et al. 2009), while Schneider adds that interorganizational relationships are more important than organizational hierarchy (Schneider 2002).

## Political Leadership

Stansfield analyzes public administration leadership from the aspect of the political leader, e.g., ministers in Great Britain and political appointees in the USA. She notes that political leaders have three areas of concern: arenas, achievements, and activities. With respect to arenas, political leaders deal with higher-level political officials, bureaucrats within their departments, and the public. With respect to achievements, these leaders typically have driving ambitions to support the goals of the elected official and can be easily frustrated when high change ambitions are stifled by limited opportunities to achieve that change. While political leaders recognize and take advantage of opportunities, they are also aware of personal risks such as being fired by the elected official or losing the current position because the elected official loses the election (Stansfield 2016).

With respect to activities, political leaders lead, communicate clearly what they want, manage connections through the development of strategic partnerships, and work within cross perspectives and multiple arenas. Political leaders are accustomed to dealing with contentious issues. They balance a focus on support for the leader of the party while paying attention to the needs of the bureaucracy that they lead. Successful political leaders persist, build alliances, maintain connections with elected officials, and keep close ties with their constituencies (Stansfield 2016).

Allen addresses the connection between political leaders and career or subject matter experts when he discusses meta-leadership. He notes that people, departments, and organizations need to

address major onetime events by disregarding traditional boundaries to develop trust, networks, collaboration, and cooperation. He stresses the importance of the political leader understanding himself, his emotions, the events, and the challenge correctly. He highlights the need for the political leader to support staff (Allen 2012).

## Bureaucratic Leadership

An important part of leadership in government research has been the interaction of the leadership style with public service motivation (PSM). Wright et al. note that transformational leadership enhances PSM and the result shapes positive organizational outcomes. The effect is indirect by shaping the values and perceptions of followers through the clarification of organizational goals. Wright et al. add that public service transformational leaders serve as role models, point followers toward goals, and challenge old organization assumptions. These activities strengthen goal clarity, improve follower motivation, and increase the employee's positive perception of the agency mission (Wright et al. 2012).

Althaus notes that public administration is a balance between strict accountability and the public interest against expedient political requirements. The bureaucratic leader becomes a trusted policy guide for and a hauler of administrative issues to the political leader. Althaus adds that in this environment no one single leadership model works (Althaus 2016).

Stansfield notes that civil servants need to allow political leaders space and scope to shape agendas, develop relationships, and operate from a political perspective (Stansfield 2016). Consistent with Stansfield's perspective, Kellis and Ran suggest that public administrators are reluctant to choose strong leadership in deference to the role of the elected official in policy making. They highlight the need for the public administrators to be authentic, following an internal moral compass and behaving consistent with that compass. There is a tension between leadership discretion and accountability to the will of the people. The work of the public administrator crosses multiple partnerships, departments, levels of government, and networks. In this context, new public leadership theory focuses on organizational stakeholder involvement rather than decision-making centered in one person (Kellis and Ran 2013).

Ingraham notes that the public service environment is complicated by unanticipated needs, constrained resources, and a focus on performance (Ingraham 2005). Riccuci indicates that executive bureaucrats require both political and managerial acumen, the ability to deal with difficult situations and technical expertise (Riccucci 1995). Smith suggests that women tend to be selected for public leadership positions when times are tough and the risks are high (Smith 2015).

## Conclusion

Leadership approaches in organizations have varied over time. However, the trend is clear. Older leadership methods tend to be focused on structure, while newer leadership methods focus on adaptiveness. Older leadership perspectives tend to focus on process, and newer leadership perspectives focus on people. Older leadership techniques tend to provide rewards and punishments, while newer leaderships techniques share information and encourage employee involvement.

The older leadership tactics still work in stable environments. However, most organizations no longer have stable environments. The environment for public sector organizations is particularly rife with change. Elections bring cyclic change. Restricted budgets, which currently affect most public organizations, cause change. The demands for transparency raised by the public, the involvement of the public in voicing policy concerns using new social networking tools, and long-term mistrust of government all push change in the public sector. This change will force public sector leaders to use the newest leadership techniques.

# Leadership in the Public Sector of Trinidad

Simone Francois-Whittier
Department of Political Science, University of the West Indies, St. Augustine, Trinidad and Tobago

L

## Synonyms

Chief administrator; Under secretary

## Definition

The most senior civil servant of a government ministry charged with running the ministry on a day-to-day basis.

Permanent secretaries are the non-political, usually career civil service heads, leaders (and "accounting officers"), or chief executives of government ministries who have security of tenure and are expected to hold their positions for a number of years, i.e., permanently, at a ministry as distinct from the changing political heads of these ministries; in Trinidad and Tobago's instance, the political posts are called ministers and junior/deputy ministers.

The permanent secretary (PS) is the most senior civil servant and accounting officer, in a government ministry. Each permanent secretary supports the government minister at the head of the ministry, providing a second rung of

leadership, and is also accountable to parliament for the ministry's actions and performance.

## Introduction

The part of the national economy composed of government ministries, departments, and government-run enterprises and agencies that provide goods and services to the population is known as the public sector. Such goods and services include health care, education, security, public roads, transportation systems, as well as the economic management of the resources of the state.

In Trinidad and Tobago, the President of the Republic acts on the advice of the prime minister and appoints ministers under the provisions of subsection (3) of Section 76 of the Laws of Trinidad and Tobago. Every ministry is led by a minister, and in some cases, ministries have a deputy or junior minister or parliamentary secretary. These ministers have cabinet responsibility for the ministry that they are appointed to by the president.

The current structure of the public sector of Trinidad and Tobago has multiple levels of leadership. The Civil Service Act Chapter 23:01 of the Laws of Trinidad and Tobago states,

> *3. (1) The several public offices in the public service from time to time set out in the First Schedule shall be deemed to constitute the Civil Service of Trinidad and Tobago which is hereby established for the purposes of this Act.*
>
> *(2) A public officer who holds a public office in the public service that by subsection (1) is deemed to be an office in the Civil Service shall be referred to as a civil servant.*

This act goes on to outline certain senior public officers in its Second Schedule. The permanent secretary is named in this schedule, this office is present in each ministry, and its holder is the most senior civil servant and is responsible for the day-to-day running of the ministry.

The permanent secretary's post forms the second level of leadership in each ministry and is charged with leading the ministry in a functional sense. Persons holding this office often ascend to the position based on a system of seniority-based promotion. Leadership in government ministries often demonstrates a functional perspective of leadership where leadership is determined by the organizational context (Katz and Kahn 1978) and at the service of organizational effectiveness (Zaccaro and Klimoski 2001; Hackman and Walton 1986). In such a system, the hierarchical context of leadership would determine the degree of responsibility, influence, control, and power that any position holds. In this context the permanent secretary would hold the second highest position of leadership in the ministry's hierarchy.

## Role and Function of the Permanent Secretary

The permanent secretary is expected to direct the operations and activities of a ministry. The permanent secretary provides the leadership necessary for the effective functioning and supervising of its departments, divisions, finances, and human resources. The permanent secretary also provides policy advice to the minister, formulates and implements policies and programs, and gives decision-making support to the minister. The permanent secretary is involved in overseeing the ministry's financial management, procurement, strategic planning, and strategic functions. The permanent secretary is also responsible for the ministry's public relations and recruitment activities and ensures that appropriate human resource management policies are implemented.

A permanent secretary is expected to use their initiative, discretion, and independent judgment in keeping with existing legislation and policies in order to achieve identified performance goals in keeping with the government's policy framework. The permanent secretary is the accounting officer and procurement officer of the ministry and is responsible for the development and review of the annual budgetary proposals and administers disbursements in accordance with existing financial regulations. The permanent secretary is also expected to manage a cadre of professional, technical, and administrative personnel and negotiate

and communicate effectively with both internal and external clients.

The permanent secretary is required to report to the parliament and attend parliamentary proceedings adding another dimension to the role and function of the office.

The permanent secretary reports to the minister on the operations and accomplishments of the ministry and ensures that the minister is provided with the required notes for cabinet, speeches, briefing documents, as well as responses to parliamentary questions. The permanent secretary also represents the minister and government in local and international fora.

## The Law and the Permanent Secretary

The permanent secretary's role and function is not outlined in one piece of national legislation; instead a number of divergent pieces of legislation outline the parameters within which the permanent secretary must function, and these are the:

1. Civil Service Act Chapter 23:01 of the Laws of Trinidad and Tobago
2. The Exchequer and Audit Act Chapter 69:01
3. The Financial Regulations, made under Section 45(1) of the Exchequer and Audit Act Chapter 69:01
4. The Integrity in Public Life Act 2000
5. The Public Procurement and Disposal of Public Property Act 2015

The **Civil Service Act Chap. 23:01** outlines the permanent secretary's role with respect to recruitment, staff allocation, reporting, record keeping, fiscal responsibility, performance management, payment of allowances, staffing arrangements, personnel management, property management, and staff discipline.

The **Exchequer and Audit Act Chap. 69:01** outlines the role of the permanent secretary regarding financial oversight and his/her role as the accounting officer with regard to the inspection of the official books and records. Under this act, the permanent secretary has additional reporting responsibilities with regard to the reporting of undue delays in revenue collection. Section 4(b) of the financial regulations indicates that, as accounting officer, the permanent secretary is responsible for ensuring that the public funds entrusted to him/her are properly *safeguarded and are applied only to the purposes intended by Parliament* and that *the financial business of the State for which he is responsible is properly conducted*.

The **Financial Regulations** made under Section 45(1) of the Exchequer and Audit Act Chap. 69:01 go on to outline in great detail the responsibilities and liabilities of the accounting officer. The accounting officer is responsible for ensuring that the prescribed system of accounting is established and maintained, supervising the receipt of public funds and the appropriate allocation of same, the securing of public money and the appropriate management of this money, and the strict supervision of subordinate officers who collect and spend public money. The Permanent Secretary is required to prepare and transmit to the Auditor General an account of the money expended by his/her Ministry.

The **Public Procurement and Disposal of Public Property Act 2015** outlines how public property should be retained and disposed of in accordance with the principles of good governance such as *accountability, transparency, integrity and value for money.* It outlines how procuring entities, the public bodies engaged in procurement proceedings, should conduct business. Consequently, the act's provisions outline how permanent secretaries are expected to execute public procurement on behalf of the state. It also outlines how stores and equipment of a public body should be disposed of, thereby outlining the role of the permanent secretary as the accounting officer.

The **Integrity in Public Life Act 2000** requires permanent secretaries who are identified as "persons in public life" to file declarations of their income, assets, and liabilities with the Integrity Commission. This commission was established to prevent corruption on the part of persons in public life through its provisions for public disclosure, regulation of the conduct of persons who carry out functions on behalf of the public, and the

preservation and promotion of the integrity of public institutions and officials. These persons, including permanent secretaries, are expected to file a declaration of income, assets, and liabilities in excess of 10,000 Trinidad and Tobago dollars with the commission and to advise the commission of any changes in their registrable interests. Any breach of the provisions of the act would result in the commission taking such action as it deems appropriate, or, in the instance that an offence has been committed, referring the matter to the Director of Public Prosecutions.

Section 24 of the Integrity in Public Life Act 2000 requires permanent secretaries (and other persons in public life) to perform their functions and administer public resources in an *effective and efficient manner*. This section of the act goes on to stipulate that such officials are to:

(a) *Be fair and impartial in exercising his public duty*
(b) *Afford no undue preferential treatment to any group or individual*
(c) *Arrange his private interests whether pecuniary or otherwise in such a manner as to maintain public confidence and trust in his integrity*
(d) *A person to whom this part applies shall not*:
(e) *Use his office for the improper advancement of his own or his family's personal or financial interests or the interest of any person*
(f) *Engage in any transaction, acquire any position or have any commercial or other interest that is incompatible with his office, function and duty or the discharge thereof*
(g) *Use public property or services for activities not related to his official work*
(h) *Directly or indirectly use his office for private gain*

This act goes on further to outline the perimeters within which the permanent secretaries can operate with regard to the receipt of gifts, confidentiality, a prohibition on the use of "insider information" and influence, as well as conflict of interests. This act prohibits these officials from breeching the confidentiality of their offices, using their positions to disclose sensitive information to which they have become privy, as well as the use of their respective offices to influence or coerce persons in order to further their own personal interests. The act also sets a limit on the value and nature of the gifts that these officials are allowed to receive and under what circumstances.

The foregoing pieces of legislation outline the very wide gamut of the permanent secretaries' responsibilities which range from that of the financial responsibilities attached to the post to the high standards of personal conduct and integrity expected of the officer to their responsibilities for the maintenance of government property. These laws have as an underlying theme the requirement of high standards of professional and personal conduct resulting in good governance.

There is however one other aspect of the permanent secretaries' role that must be examined, that of their interaction with the political directorate, i.e., the elected/selected politicians who are given the responsibility of being the minister of each ministry. At times the relationships between the respective permanent secretaries and the respective ministers often involve conflicts of a financial and policy-related nature and lead to inefficiencies in service delivery and a lack of effective governance.

## Conflict Between the Permanent Secretary and the Political Directorate

In the public sector of Trinidad and Tobago, there is ample room for conflict between the permanent secretary and the executive/political directorate due to the absence of specific rules and regulations to govern the very delicate relationship between the two offices. The term "political directorate" refers to the executive inclusive of cabinet ministers as well as other elected or selected politicians.

According to Svara (1999, 678), *The complementarity of politics and administration holds that the relationship between elected officials and administrators is characterized by interdependency, extensive interaction, distinct but overlapping roles, and political supremacy and administrative subordination coexisting with reciprocity of influence in both policy making and administration*.

Such *extensive interaction* and *interdependency* as well as *overlapping roles* often

lead to conflict. These "political" office holders are not bound by the same terms, conditions, laws, and regulations as their respective permanent secretaries; indeed conflicts often occur due to the perceived inflexibility of the permanent secretaries and their reluctance in some instances to unquestioningly go along with and implement executive's plans (Larson and Coe 1999).

Indeed it is widely acknowledged, though not accepted, that the elected/selected minister, as the political leader and representative of the executive, has responsibility for policy direction of the ministry that he/she has been charged with based on the general policies of the government of the day (Agere 1999). Alternately, the permanent secretary, in his/her capacity as the "leader" of the ministry, has responsibility for the day-to-day running/administration of the ministry. The interaction of the offices of the minister and permanent secretary is often not that clear-cut, and lines become blurred, with ministers requiring the cooperation of permanent secretaries in order to have the human and capital resources allocated and disbursed to have certain initiatives executed and the permanent secretary relying on the minister to have certain policy decisions taken to cabinet for executive approval. The two offices by necessity are required to have a symbiotic relationship; if cooperation and symbiosis do not take place between the two offices, the work of the Ministry will be impeded and the permanent secretary's role of ensuring the effective and efficient performance of the ministry would not be carried out.

The permanent secretary is expected to support, guide, and advise the minister on all aspects of the work of the respective ministry, and in so doing he/she plays a very important leadership role. The permanent secretary cannot coerce or force a minister to take his/her advice or to pursue any particular course of action. The Exchequer and Audit Act Chap. 69.01 makes provision for instances where there is disagreement between the permanent secretary/accounting officer and the minister, in Section 10 of the act. In such an instance the permanent secretary is expected to place his/her objections in writing to the minister and following the minister's adherence of his decision, accept the decision, and act only on the written instructions of the minister; copies of the objections are to be forwarded to the treasury and auditor general.

However, there are other instances of conflict upon which the laws and regulations remain silent, such as policy direction, politically motivated/partisan changes in non-legislated processes and procedures, political interference in the administration, and daily running of the ministry (Singh and Singh 2011; Hodder 2009; Farazmand 2001). If the permanent secretary is unfamiliar or unsure of his/her role and function, it is possible for an overzealous minister to assume the role of "administrative leader" and become the "de facto permanent secretary" of the ministry and commandeer its operations. There is little or no legislative or regulatory redress for such an infraction, and often such an occurrence can only be stopped by directly appealing to the head of the public service and possibly the prime minister for an intervention (Larson and Coe 1999).

## Conclusion

The permanent secretary carries out a very important leadership role in the public sector of Trinidad and Tobago. The holder of this office is expected to direct the operations and activities of a ministry, while adhering to the various laws and regulations which govern the operations of the office and the agencies within the public sector. Attached to this office is a great deal of responsibility; indeed, the holders of said office are accountable to the executive and legislature while not being elected officials themselves. Further to which, the permanent secretary is expected to guard the public interest against unscrupulous politicians and administrative inefficiency and wastage.

While there are various laws which govern the work of the permanent secretary, it is extremely important for a permanent secretary to be intimately acquainted with and to understand the length and breadth of his/her duties and functions in order to carry out the areas of the work for

which there are no rules or legislation. A permanent secretary who is thoroughly acquainted with their duties as well as the laws/regulations that govern the same would be well placed to guard against conflicts with the political directorate and be able to avoid any attempts at political interference or influence and successfully don the mantle of leadership.

# Leadership in the Remote, Freelance, and Virtual Workforce Era

Francesca Flood
Hope Verdad, LLC, Lake Frederick, VA, USA

## Synonyms

Freelance – self-employed

## Definitions

Esprit de corps – team cohesion and loyalty
Virtual workforce – off-site staff

## Introduction

Within the next decade, companies anticipate that more than one third of their full-time, permanent workforce will work remotely (Inavero 2018). Complimenting on-site staff with remote expertise can provide huge benefits to companies including cost savings, speed, and flexibility (Younger and Kearns 2017). Recruiting talent has become increasingly difficult requiring more agile work models. To address this phenomenon, companies are embracing a remote, freelance, and virtual workforce. A virtual team can be defined as "a group of individuals who work across time, space, and organizational boundaries, and interact primarily through electronic communications" (Experteer 2018, paragraph 1). To access needed skills, organizations are searching beyond their local market, hiring team members across states and countries. Adopting a remote workforce

model has eased hiring for many organizations and increased access to talent (Inavero 2018). Those who refuse to adopt this new model risk losing their current employees as well as potentially overlooking future talent.

Leading a distributed workforce requires resources, formal policies, and new ideas to create teams who will be relied on to achieve goals and objectives. Performance management, training, communication, and relationship building take on a different level of complexity when employees are not on-site and dispersed across multiple time zones and varied cultures (Hickman and Pendall 2018), all of which challenge the ability of managers to adequately motivate, coach, and develop employees within a virtual environment. This increasing trend will require new leadership skills in an era when staff no longer work in the office next door.

## Background

More than three decades ago, a sense that the demands and style of workforce were shifting began to develop. A new entrepreneurial style of leadership was emerging to accommodate this new employee mindset (Kanter 1986). Just as the new workforces of the 1960s, 1970s, and 1980s demanded radical change, so too will the workers of the twenty-first century. New employee characteristics and attitudes are shifting not only in location but in hours, job sharing, and evaluation (Kennelly 2015). Multiple, converging factors are influencing the shift in workplace staffing and leadership roles. Major advances in technology, shortage of talent, and new generational expectations are at the forefront. In many cases, companies offer employees a remote work environment out of necessity. Global companies in the technology and other sectors employ highly skilled employees regardless of their geographic residence (Predictive Advantage 2014).

Though most organizations are using a remote workforce and have technological systems in place to support them, many do not have policies in place for off-site workers. Organizations who have implemented policies believe they have become more lenient and inclusive (Inavero 2018). Still, for those who grew up in a traditional management style, it may be difficult to alter long-held beliefs. The era of managing while walking around and using visual cuing to check on employee well-being is changing. Leaders will no longer be able to discern the dedicated and hardworking employees simply by their on-site hours or visible presence (Ware and Grantham 2010). As the new millennial leaders take the helm, some previous generation management may resist, desiring to keep things status quo or preventing any deviation from established protocols (Flood and Klausner 2018). The changing workforce landscape will present many opportunities as well as challenges.

## Challenges to Consider

As more organizations implement a virtual and remote workforce model, the need to address unforeseen modifications in structure, procedures, technology, management, and other operational aspects increases. With off-site staff, leaders will need to explicitly communicate the values and culture of the organization to ensure understanding and acceptance (Ware and Grantham 2010). Despite the challenges associated with remote work environments, increasingly, staff has come to expect to work off-site not as a privilege or perk but as a normal part of their job (Predictive Advantage 2014).

When organizations migrate to a remote work environment, myriad factors must be considered. Such factors include recruiting, pay structure, performance measurement, how bonds and connections between workers will be developed to form a team, operational protocols, and training. Moreover, organizational culture and the recognition and understanding of cultural diversity are key areas of focus. Transitioning from a command orientation and bureaucratic hierarchical culture requires not only training but commitment (Flood and Klausner 2018).

Successful remote workers will be self-directed, motivated, resourceful, and able to

identify their own career paths. Unlike employees who relied on management's detailed direction, leaders will need to recognize and cultivate talent that can solve problems, network with their peers, and direct their own projects (Hickman and Pendall 2018). An essential role of leadership will be to build personal relationships as this may be the only connection workers have with the organization and how they form their impression of it.

Though some managers may assume that remote and on-site employees can be managed the same way, there is a great difference between the two. Without physical proximity to fellow workers and the commensurate social element associated with an on-site workplace, the remote employee may feel isolated. Without visual cues, body language, and face-to-face communications developed with day-to-day contact, there are less team cohesion, trust, camaraderie, and satisfaction with the team (Experteer 2018). Without a sense of belonging, it is difficult for remote workers to understand the role they play and build a shared sense of purpose.

When conflicts arise in an on-site environment, management can resolve such disagreements between parties by bringing them together in discussion. In a virtual workplace, leaders may lack the skills and tools to manage such conflicts (Younger and Kearns 2017). Without sufficient training to work with remote staff, conversations become less effective, project management and deadlines falter, and speed of decision-making suffers (Experteer 2018). Moreover, an inherent risk of overreliance on electronic communication may develop. Rather than utilizing mediums that facilitate visual communications such as video conferencing, communication might be relegated to emails and texting. When used as part of an overall communication strategy, these mechanisms are useful. When overused or used exclusively, communication and hence relationships suffer. Management can deliver hard messages hiding behind email, and staff may become blunt and use inappropriate language or exaggerate (Warrell 2012). Technology is a powerful and driving force. Yet technology is not without its own challenges. In addition to functionality issues, lacking eye contact or physical contact, technology can facilitate inappropriate behavior often seen on social media.

New definition and clarity must be assigned to old nomenclature, as words will take on new meanings. With the advent of a remote workforce, terms such as timeliness, completeness, consistency, and open-door policy may have a new perspective. For staff who are working several time zones ahead, a response due by the end of day may not be addressed until the following morning. Given the amount of emails, text messages, and calls received daily, most appreciate brief responses. However, understanding what elements constitute completion in remote engagement needs to be clarified. Are there deadlines, next steps, or specific follow-up actions that precede completion? Consistency in performance translates to reliability letting members know they can count on their virtual team. Having an open-door policy in a virtual environment must transcend the physical realm allowing remote staff members access to leadership in a time zone that may not coincide with management's office hours (Predictive Advantage 2018).

Not everyone is cut out to work remotely. Many lack self-discipline/self-direction, do not have an environment conducive to working away from the office, require more immediate feedback, or need to be in physical proximity to others. Working remotely is a physical and psychological separation. The lines between home and personal life can become blurred, leading to endemic burnout among remote workers unless they learn how to turn work off. Employees who are denied the opportunity for remote work could harbor resentment toward those who do perceiving inequity (Ware and Grantham 2010).

Before an organization implements a remote workforce model, team members must understand why the program is being launched, the desired business objectives for doing so, and the role they will play in achieving them. Blending an on-site workforce with a remote team can create challenges that cause suspicion and resistance from employees. Without trust and collaboration in an organization, overall performance suffers (Younger and Kearns 2017). The proliferation of the virtual team has had a significant impact on managers, who must reconsider traditional

management strategies on how to meet the unique challenges, communicate, and collaborate (Predictive Advantage 2014).

## Leadership Response

Emerging leaders who will manage the remote workforce of today and into the future will be markedly different from the leadership of the twentieth century (Hickman and Pendall 2018). A new workforce with flexible work hours that cater to their lifestyle and wide geographic mobility will demand it. The top-down decision model will give way to autonomous and agile workers capable of self-management and motivation as well as resourcefulness (Flood and Klausner 2018). At the same time, when problems do arise, management is available to help remedy the situation (Hickman and Pendall 2018).

Managing staff from a distance is vastly different than managing face-to-face. Beyond technical and business skills, leadership must acquire specialized aptitudes for coaching, adaptability, career guidance, communicating, interpersonal relationships, and developing cultural sensitivity (Predictive Advantage 2014). While outcomes and performance are key metrics to determine the effectiveness of staff, another essential characteristic to successful remote management is mutual trust between staff and leadership (Younger and Kearns 2017). Relationships at the office are born from comradery, collaboration, and personal interaction. From these, trust develops creating a sense of cohesion and confidence in each other. Lacking physical interaction, management must develop a trust that virtual teams can effectively communicate, self-manage their time, possess motivation, and have resourcefulness to deliver results (Predictive Advantage 2014).

When teams are in physical proximity, they socialize, share personal narratives, and develop bonds of friendship. An esprit de corps grows beyond the boundaries of work, tasks, and the physical office. This human connectedness, where family photos are shared, socials are planned, and staff vent about work, becomes part of the organization's subculture and an integral part of employees' lives (Kennelly 2015). Working alone can be lonely, and remote employees need to feel a part of work's social connectedness. Technology can be used to see faces, hear voices, build teams, brainstorm, and share socially. Team events, whether in person or virtual, need to occur to provide a sense of belonging. Such events offer remote and on-site staff an opportunity to experience a different side of their teammates through body language, sense of humor, and personal stories. Moreover, such events provide an opportunity to recognize remote staff in front of their peers for job performance (Workfront 2019).

Migrating to a remote work platform is not simply a matter of allowing existing employees to work off-site. It will require astute recruiting and ensuring not only the right technical talent but personalities suited to working off-site. Organizations are using personality assessments as a tool for managers to recruit the right people (Predictive Advantage 2014). Moreover, managers can select on-site employees who have demonstrated the skills and abilities for self-direction. With a global workforce, leaders will need to navigate varying personalities from multicultural backgrounds and create an ethos of collaboration, cultivating a team from disparate individual contributors.

Implementing a remote workforce will require an overhaul of formal training programs for all levels of the organization from top leadership to down. There will be a need to raise awareness of the new work environment and its implications (Ware and Grantham 2010). Protocols and measurement matrices will be required to measure performance, thus requiring closer collaboration between human resources, procurement, legal, and information (Dessain 2014). Expectations which are specific, measurable, action-oriented, realistic, and time-bound must be communicated. Human resources must now embrace a new paradigm of a virtual workforce that is hyper-connected through technology (Kennelly 2015).

A micromanagement style will no longer work for a remote workforce that thrives on autonomy. Without seeing individuals face-to-face, new communication etiquette must be developed. Unlike situations where a manager can pop into an office in physical proximity to clarify, correct, or update objectives, remote employees require better

upfront communication and regular updates. Learning how to build trust throughout the organization will become an essential part of organizational culture (Ware and Grantham 2010).

More than diverse personalities, a global staff presents myriad cultures, race, ethnicities, and religions, perhaps more diverse than many staff have been exposed to. Establishing a workforce that recruits from the world requires cultural awareness, and sensitivity training is essential (Experteer 2018). While a remote workforce will present its challenges, it also presents an opportunity for employee loyalty and retention. Instead of losing a valued employee when personal circumstances create a need for relocation, remote work helps retain these valued employees plus their institutional knowledge. The costly expenses to recruit, hire, and train a replacement are reduced or eliminated (Ware and Grantham 2010).

## Conclusion

Virtual collaboration technology, skill shortages, the sharing economy, as well as millennials' expectation for a more flexible employment model will drive the remote workforce phenomenon (Dessain 2014). Each generation of leadership will need to embrace the new paradigm of doing business. It is a new workforce and new workplace. Remote working is expected to increase substantially with the generational shift of the workforce, continued technological advancements, and expanded globalization. Preparing for and addressing these challenges enables the organization to inculcate an inclusive remote workforce culture. The right leadership will build trust with constant contact, encourage open dialogue, and cultivate collaboration (Kennelly 2015). As organizations move toward a remote workforce, the more virtual they become, the more essential the leadership skills.

# Leadership on Immigrant Integration

Jamie Longazel
Department of Political Science, John Jay College of Criminal Justice, City University of New York, New York, NY, USA

## Synonyms

Acclimation; Immigrant incorporation

## Definition

When individuals, organizations, or governments take initiative to foster immigrants becoming part of the community or society within which they have recently settled, without requiring newcomers to relinquish their own culture.

## Introduction

The term *integration* describes more than one group coming together and becoming part of a whole. *Immigrant integration*, then, involves immigrants becoming a part of the community or society within which they have recently settled. Note how this is distinct from *assimilation*, which many people often mistakenly use interchangeably with integration. Assimilation refers to groups shedding their previous culture in favor of the new one; with integration, the original culture is retained.

## The "5 Ws" of Leadership on Immigrant Integration

Of the "5 Ws" – who, what, where, when, and why – *who* is probably the most important with regard to leadership on immigrant integration. Who takes the lead? Or, who *should* take the lead? We can obviously put the latter question up for debate, but there is a long tradition in immigrant communities and advocacy circles of asserting that *immigrants themselves* ought to be at the helm. "Nothing about us without us," the saying goes. This seems simple enough: No one can speak to a group's needs and desires better than the actual members of that group. Yet, power relations are such that this often becomes the exception rather than the rule in policymaking.

One reason for this is that immigrants are typically underrepresented in legislative bodies. According to a recent report from the Pew Research Center (2015), people born outside of the United States comprise only 1% (six members) of the US Congress, despite accounting for 13% of the nation's total population. However, this has not stopped immigrant communities from putting pressure on lawmakers or from working to foster integration on their own. Some of the most notable examples of leadership on immigrant integration come from the bottom-up rather than top-down. Nonprofit, grassroots, and faith-based organizations – many created and led by immigrants – often provide essential services. Such groups also engage in meaningful advocacy and provide newcomers with a sense of community, including space to embrace their native culture.

Which leads to the *what* question: What is leadership on immigrant integration? What does it look like? In terms of policy, we might say there are two types of efforts that generally facilitate integration: those that provide *access* – measures that allow immigrants to acquire the basic services and resources they need – and *protections* – efforts to protect immigrants from a variety of abuses, which would otherwise inhibit the integration process. In the United States, policies focused on increasing access to services include but are not limited to: agreements to accept the Mexican *matricula consular* ID card – and other countries' equivalents – as valid forms of identification; governmental efforts to provide translation and interpretation services; and various programs that, cognizant of culture, language, and other potential barriers, increase access to housing, employment, education, healthcare, and the like.

While many of these policies are immigrant-specific, others that are not still have wide applicability and can thus be beneficial to immigrant populations (Mitnik and Halpren-Finnerty 2010). Labor-related policies are a good example of protective efforts. Policies that protect against wage theft, improve working conditions, and increase wages offer important benefits to working class people generally, but, considering that immigrants are often exploited for their labor and are often victimized by wage theft, these polices are especially valuable for facilitating the integration process.

Under this category we can also include policies that protect undocumented immigrants who are crime victims. Because of the threat of deportation, many undocumented immigrants – as many as 70% according to a recent report (Theodore 2013) – are hesitant about turning to law enforcement when they are the victims of a crime. This problem is especially pronounced in domestic violence cases (e.g., Orloff et al. 2003–2005). And because in the USA so many immigrants live in "mixed-status families" (i.e., some family members have authorization to be in the country, others do not), the problem affects more people than many realize.

As an example of a policy that would combat this problem – and, indeed, an example of policy leadership – the Massachusetts legislature recently introduced legislation called the Safe Communities Act (SCA). Among other things, the SCA would not allow local police officers to arrest a person strictly because of their immigration status. As the Massachusetts Immigrant and Refugee Advocacy Coalition (n.d.) puts it, "the Safe Communities Act protects the civil rights, safety and well-being of all residents by drawing a clear line between immigration enforcement and public safety."

*Where* is leadership on immigrant integration happening? Integration efforts typically take place at the local level. Indeed, US law distinguishes between *immigration* policy – which involves issues of citizenship and border control and is within the purview of the federal government – and *immigrant* policy – which involves the dissemination of services and is a local matter. In recent years, many cities have taken on a leadership role by making integration a priority and declaring themselves "immigrant friendly." (Note that this is distinct from the "sanctuary city" designation, which is often over-used as a scare-tactic in political rhetoric but generally refers to cities that refuse to cooperate with federal immigration officials, thus making their jurisdictions "safe" for undocumented immigrants.)

For example, Dayton, Ohio approved the "Welcome Dayton – Immigrant Friendly City" resolution in 2011, which articulated an action plan around immigrant integration in a variety of realms (e.g., business, local government, social services). Efforts such as these, some of which do a good job of involving immigrants in the process, have inspired other jurisdictions to adopt similar practices. In fact, representatives from various "welcoming cities" have taken on a leadership role by working together to share information and best practices on their immigrant integration efforts. Dayton is among a host of cities that have affiliated with "Welcoming America," a nonprofit organization devoted to aiding integration on a broader level by bringing such communities together.

Even though the local level is often where the action is, US states as well as countries have also exhibited leadership on immigrant integration. One recent trend in the USA involves state governments taking steps to accommodate immigrant professionals who have received certificates or degrees from outside the USA. A 2015 bill in the state of Georgia, for instance, sought to accommodate nurses trained in their home countries in such ways. At the national level, and in sharp contrast to the United States, Canada's official governmental policy declares support for multiculturalism. According to sociologist Irene Bloemraad (2006), this has important implications for how immigrants differently integrate into these two countries. Her research found that Canada does a much better job with citizenship acquisition and that these inclusive policies increase political participation among citizens born outside of Canada.

It makes sense to take the final two "Ws" – *when* and *why* – together: *When* – or, under what conditions – do leaders on immigrant integration tend to emerge? And *why* is leadership on immigrant integration important? Notably, many of the integration efforts described above have emerged in response to a corresponding resurgence of nativism, accompanied by exclusionary policies and rhetoric at the national, state, and local-levels. The SCA in Massachusetts – like many other state-level pro-immigrant initiatives passed in the USA since 2017 – was a direct response to the Trump administration's efforts to ramp up deportations and ban Muslims from entering the USA. Immigrant-friendly initiatives like Welcome Dayton similarly came at a time when exclusionary state- and local-level measures were proliferating.

It perhaps goes without saying that exclusionary policies have substantially hindered immigrant integration. In some cases, this has been the stated intent. Some exclusionary policies, such as California's Proposition 187, passed by ballot initiative in 1994, attempt to deny undocumented immigrants access to education and social service benefits. Others aim to instill fear within immigrant populations, thereby not-so-subtly encouraging them to relocate to others locales or to return to their countries of origin. "Self-deportation" was the name given to the strategy underlying policies of this sort.

The most well-known of these in the USA is probably Arizona's SB 1070. Colloquially referred to as the "show me your papers" bill, this law allowed police to stop and question anyone whom they had "reasonable suspicion" was in the country without authorization. Hazleton, Pennsylvania's 2006 Illegal Immigration Relief Act (IIRA) – which sought to punish landlords and businesses for renting to or hiring undocumented immigrants and to make English the city's official language – is a prominent local-level example. This ordinance, though ruled unconstitutional and never enforced, was passed with the explicit intent of "[eliminating] illegal aliens from the city of Hazleton" (Longazel 2016, p. 2).

Policies like these speak directly to why leadership on immigrant integration is so important. Although the claim is usually that these are simply efforts to uphold the rule of law or to root out crime, empirical evidence as well as the actual experience of immigrants, particularly Latinx immigrants, in these communities tells a very different story. A large body of social science research shows that immigrants *do not* commit more crime; in fact, they may actually help reduce it. Moreover, researchers have found that in places where exclusionary legislation was introduced, there were corresponding increases in harassment, discrimination, and hate crimes, as well as corresponding hardships like psychological distress (for a review, see Longazel 2013). These effects, importantly, have been widely experienced within the Latinx community regardless of legal or immigration status. That is, they are felt by authorized immigrants as well as Latinx folks who were born in the USA. Reports have shown that fear among immigrant populations in response to SB 1070 was felt as far away as Texas (Sáenz et al. 2012). In Hazleton, US citizens who lived in that city for decades were being threatened and told to "go back to their countries" in the wake of the passage of the IIRA (Longazel 2016).

Clearly, then, leadership on immigrant integration is important in that it contests policies that stymy integration and harm immigrant communities. However, the importance of leadership on immigrant integration becomes even more apparent when we consider it in relation to the alternative of taking *no action*. Given the continued dominance of assimilationist thinking, many municipalities have chosen to stay away from the contentious debates associated with this issue, presumably with the assumption that immigrants will find their way on their own. The roots of assimilationism in the social sciences date back to the Chicago School of Sociology, which, in the 1920s and 1930s, asked questions about "what kind" of immigrants will assimilate into the dominant culture. Are some ethnic groups "better suited" to the task than others? Are there certain variables that "predict" whether one is capable of conforming? More recently, however, immigration scholars have been arguing that a lack of action – or, more

relevant here, a lack of *leadership* – leads to institutional deficiencies that inhibit immigrant integration, regardless of who comprises a given immigrant population.

## Conclusion

In a word, fostering immigrant integration requires that communities act *proactively* and with meaningful input from immigrants themselves. Beyond satisfying day-to-day necessities, policies that are "intentionally created" and "thoughtfully implemented," Linda Williams (2015, p. 433) notes, create a climate characterized by "welcomeness," which features increased levels of trust, respect, support, and community engagement. At this point we have a good sense of what works to foster immigrant integration; what is therefore most needed are leaders who can help make it a reality.

# Leadership Style in Entrepreneurship

Aaron J. Young
Pepperdine University, Malibu, CA, USA

## Synonyms

Entrepreneurs; Entrepreneurship; Entrepreneurship framework; Innovation; Leadership paradox; Organizational effectiveness; Small business; Transformation

## Definitions

- *Entrepreneur.* Business leaders whose organization delivers products and/or services to a defined customer base
- *Entrepreneurship.* Practice of creating or extracting value for a business in response to identified opportunities
- *Small business.* A new, existing, or mature organization with employees ranging from 20 to 150 persons with growing year-over-year revenues

- *Leadership paradox.* The choices leaders are compelled to make based on a resource model that encourages trade-offs whereas the situation values one or more choices to be valid options for the organization and, therefore, presents the challenge of how leaders can accommodate for multiple alternatives
- *Entrepreneurship framework.* A set of guiding concepts that provides basis for structuring related activities into a holistic understanding of the entrepreneurship
- *Innovation.* Creation, development, implementation, deployment of new product, processes, and/or services to improve on available internal or external product, processes, and/or services
- *Transformation.* Changing existing organizational structures to meet the strategic needs relating to people, processes, and systems
- *Organizational effectiveness.* Intentional organizational behaviors directed at producing as expected results and outcomes

## Introduction

Entrepreneurship has in many ways led to an expansive growth in recent years. The democratization of resources and information has provided entrepreneurs several advantages. Entrepreneurs have more access to new tools to manage their business, which helps reduce overhead, administration time, and money. For some, the increased funding has meant investments in capital expenditures. Others are able to think outside the box and come up with novel solutions and in doing so generate more business. The continual maturation of ecosystems can help advance many businesses.

As expected, entrepreneurs are in higher demand to help identify and solve novel problems. While entrepreneurial activities vary, the individuals connected to such activities seemingly consider each opportunity to act in a given time period as a condition for their modus operandi. Furthermore, entrepreneurs who face critical impact events, like a global pandemic, often recognize their skill sets will be tested. Herein lies a challenge many entrepreneurs are facing. The choice between alternative solutions to continue the business during critical impact can cause distress for the entrepreneur and their teams. While many entrepreneurs would choose between alternatives, there are other entrepreneurs who may rethink how they approach choosing altogether (Smith et al. 2016). This paradox for a leader is to figure out how to accommodate for the selection of all alternatives to address core challenges to the business.

How an entrepreneur approaches leading through these choice points in their organization can in many ways challenge the effectiveness of the business in the future. Each entrepreneur faces the tension between leading through a vision to overcome challenges with the need to empower their people to drive results. Resilient organizations tend to have safeguards to protect against dynamics that cause instability. Thus, an entrepreneur's perspective in addressing the needs of their organization during tumult can create an understanding that may fortify future success. To bridge some of an entrepreneur's basic understanding of the organizational characteristics and behaviors with models and frameworks that present a breakdown of key focal areas can provide insights into an approach to reconcile broad challenges to the business.

## Leadership Paradox in Context of Critical Impacts

An examination of critical impact events may provide context by which entrepreneurs may view their current situation and standing of their business. The entrepreneur's objective to generate value by creating and/or extracting newness related to market needs highlights the multifaceted aspects in reviewing impacts to the business. As an example, the volatility induced by a global pandemic creates the opportunity for reflection in ways many entrepreneurs may not have considered. It is clear the many entrepreneurs have responsibilities that extend beyond their control, for example, extending lines of finance to continue their operations. While financial solvency may be a consideration for some entrepreneurs,

it may not be the only pressing consideration. In the normal context of evaluating business performance as a function of economic outcomes may not be expansive enough to describe organizational objectives against the backdrop of large-scale disruptions. It stands to reason that many entrepreneurs evaluate how and to what extent organizational resiliency exists in their organizations today.

Under normal circumstances entrepreneurs are able to make judgments and decide how to handle business performance and growth within normalized operating conditions. However, the challenge of returning to normal is that many assumptions related to how we work have been challenged and especially by the disruption caused by a global pandemic. The rise of telework arrangements and decrease in travel are symptomatic responses to the health and safety conditions required for current business operations. While some industries have adapted better than others, all entrepreneurs are seeking the right solution for their business in order to adapt and pivot to new ways of working. Of course, not all businesses have been able to adjust due to the physical nature in dependencies on human interaction relating to their business. It is likely, however, that entrepreneurs across industries are thinking how to prevent their business from eroding to the point of failure. From this perspective the question of what needs to be changed is prevalent across entrepreneurs and with leadership as a particular focal point.

The degree of difficulty and challenges an entrepreneur faces likely varies depending on the nature and complexity of the business. Some entrepreneurs face the uphill battle of trying to manage inventory and moving physical products with supply and shipping lines disrupted related to the global pandemic. Other entrepreneurs face the challenge of providing product demonstrations in a virtual setting. Still other entrepreneurs face the challenge of connecting with their customers when physical customer service is not possible. This type of disconnect to the customers can be fatal to a business. An organization's touch points to the customer are generally connected through a series of processes, which include the people responsible for driving output and outcomes related to these processes. It stands to reason one of the most important activities an entrepreneur faces during critical impact events, like a global pandemic, then is leadership. How leaders care for individuals they are responsible for creates the internal organizational dialogue many organizational leaders must reconcile.

Entrepreneurs face the ongoing challenge to balance the resources of the firm with conditions in the market. Many times, this may mean the daily evaluation and trade-offs between time, investments, and people. Unlike more established organizations, entrepreneurial firms tend to lack formal structures that help maintain stability in managing resources. However, many entrepreneurs recognize the paradox in their decisions. Each time a decision to resource one part of the business is made, other parts of the business are left to solve for their own priorities. Entrepreneurs find themselves in a paradox of leading organizations knowing that tensions may exist relating to how alternatives are weighed up. Entrepreneurs may ask themselves if the current priority is to manage for today's business problem or address some fundamental future state that requires deeper analysis and considerations. They may also need to review their business model and the constraints that keep them true to their core business. The impact to the way business is conducted may be a limiting factor in the entrepreneur's ability to discern real choices to the business. Furthermore, there is a tension between the obligations to principal stakeholders and the broader ecosystem the business participates in. In other words, the driving impetus for the business may require attention on various fronts.

The notion of driving convergence within the organization tends to be fleeting when the volume and intensity of competing priorities demand attention. For the entrepreneur, this problem manifests itself in various parts of the business as well as downstream embedded in discrete processes. Subsequent leadership involvement may become an exercise in reconciling the tensions between alternatives of a current and a future state. It stands to reason then that events such as a global pandemic intensify and increase the time pressure related to leadership activities. However, an

entrepreneur may choose a practical approach to mitigating the tensions on the business and systems by organizing components of the system against a logical framework or architecture.

## Perspective on Influencing Factors to Entrepreneurship Framework

A framework applied to entrepreneurship should contextualize general components in so much as to capture key activities and work streams. While many frameworks for entrepreneurship seem to exist, the use of a consolidated representation framework provides sufficient themes for review. Here it is understood that the context by which the entrepreneur has framed the business determines the size, complexity, and involvement required for the business to run. A fixture of the business must require a defined resource model along with processes to support the business and maintain organizational effectiveness. Ultimately, the entrepreneur must solve for some novel problem and/or condition. Each entrepreneur will invariably apply their own perspective to how they approach the problems and/or conditions they are trying to solve for. To synthesize all the tension relating to each of these components within a general entrepreneurship framework is too expansive for current scope and analysis; but samples of diametrically opposed issues around the framework components allow for a better understanding of the trade-off considerations to converge resource management as well as disconnect hyper-focused issues that may do well to be rearranged to explore other connections.

As the size of an organization often matters in so much as to explain magnitude and impact, the context by which an entrepreneurial firm is evaluated can span across various segments. Today, entrepreneurs connote a sense of small, nimble start-up like organizations set out to solve complex technology problems affecting the other like-minded technology providers. Technology was not decidedly the hallmark of a value creating entrepreneur. Prior to this image, an entrepreneur could be envisioned as a proactive businessperson looking to solve any problem big or small impacting their community or address neglected product and services offerings by larger, more established firms. Furthermore, an entrepreneur may have been working on a product or service for decades before becoming more commercially successful through new approaches to the business. As it happens, time horizons may not depict an accurate current state of entrepreneurship nor validate a successful venture unless the organization is contextualized in a way that provides a better understanding of the problems and solutions an entrepreneur and team are providing value for.

For some entrepreneurs, the notion of planning well is in direct conflict with the spontaneous nature of creation and innovation. The perception of adding structure around concepts and ideas may perpetuate the notion that entrepreneurism is a reactionary activity occurring at the whims of a mastermind entrepreneur. However, successful small firms rely on well-planned strategies to help execute the entrepreneur's vision (Hannon and Atherton 1998). Said more specifically, the entrepreneur's focus on being aware of externalities, pursuit in converting known and unknown opportunities to business results, and determining how to build momentum through successive outcomes underscores the necessary posture in competitive markets.

While many entrepreneurs may engage in strategic planning activities throughout the organization in an attempt to solidify management competence, the maturity of effective planning tends to vary across industries and between individual entrepreneurs. An argument arises that entrepreneurs who tend to focus heavily on planning activities miss out on acting decisively to business opportunities (Hannon and Atherton 1998). The criticism may be better articulated as the trade-off between overemphasizing planning activities compared to the focus of transitioning plans to action. This is not to diminish business insights and intelligence as an irrelevant artifact linked to strategic planning, but rather the need to make the information as actionable to the business as possible. Entrepreneurs must balance their business against the context in which the business may be most optimally positioned to thrive using

planning as a backdrop to help guide their understanding and decisions for the business and the organization.

Business objectives require resourcing to translate plans into activities. Resourcing for many organizations is often a laborious process. In cases where the business resource models require raw materials, plant, power, and equipment, or large capital outlays, the organization may require additional layers of complexity related to the resourcing process. For those organizations whereby people represent the largest challenge in proper resourcing, the ability to define the right resource model can become challenging. A resourcing plan may include broad alignment to an organization's strategy, connecting several layers down to the activity and task level within an organization. To find the right level of detail may require the entrepreneur to have flexibility in their thinking. One way to approach resourcing is to break down activities into the most logical organizational structure and assign responsibilities to individuals with a collection of tasks. Another option is to supply an organization according to the priorities of the business demand. As entrepreneurs think about the trade-offs between the number of resources and the performance of the firm, inevitably an entrepreneur's own leadership may influence the resourcing model. In other words, how the entrepreneur chooses to lead their organization may contribute to enhancements in the overall abilities of the firm.

An entrepreneur, who contributes to building dynamic capabilities through resourcing activities, can reinforce an internal operating model focused on carrying out the organization's strategic plan. The challenge many entrepreneurs face is how to create a reliable routine that enables business processing (Worley et al. 2016). Typically, processes become static over time, thereby entrenching ways of doing business as part of its cultural norms. In fact, when challenging situations arise like the impact of a global pandemic, an organization's ability to change course tends to highlight neglected areas of the business. However, entrepreneurs who are active in challenging their own approach to managing the business can better enable the formation of dynamic capabilities to address unforeseen events. Dynamic capabilities allow for organizations to repeatably and reliably create value in unpredictable environments. By favoring dynamic capabilities, entrepreneurs are able to view resourcing as an activity that directly supports the strategic intent of the organization.

Another challenge entrepreneurs may face in cultivating dynamic capabilities is in the ways their teams are able to connect, especially when physical distance is an operating norm (Flood 2019). Some organizations are not well-equipped to foster team collaboration across multiple locations. This may be a result of a business that is heavily dependent on physical locations. Another reason an organization may not be prepared to support employees in multiplied physical locations may be related to the ability of the organization to operate across digital touch points to get work done. For a variety of reasons, the notion of having remote work as a norm may not be at practical. Furthermore, the effectiveness of collaboration can be limited by the familiarity team members have with one another. Separation may cause additional challenges when team members are expected to integrate new members to the organization but cannot meet in person. When the entrepreneur is challenged by the additional resource model constraints, as is the case when there are obstacles to effective collaboration, thoughtful leadership tends to underscore the ability of the organization to continue to deliver value for their clients and/or customers.

To codify routines into processes in order to meet business objectives, effective entrepreneurial organizations tend to bridge people and their responsible tasks in a way that helps drive value to the business. An entrepreneur may choose a collection of processes that are uniquely suited for the business as to avoid implementing any industry standard processes. Opposite to this an entrepreneur may choose to only implement industry standard processes with little to no variation to account for their business. More practically, most entrepreneurs will fall somewhere in the middle to these scenarios. The notion of having a baseline of standard processes means the level of sameness

can be applied to tasks that are not considered differentiators or value creators for the business. Therefore, the limited number of unique processes to the business can be managed in a way that supports entrepreneurship, in so far to say that process building is an activity that supports individuals to create and/or extract value for the business.

At the center of an organization's core competency lies a set of unique processes that enables the business to generate and extract value for clients and/or customers. Processes that involved manual and/or physical tasks may be considered finite in its set of unique applications. By comparison processes transacted digitally tend to generate more unique process combinations. Any mixture then would contribute to uniqueness itself. It stands to reason the speed and scale value can be created, derived, and/or extracted for entrepreneurs rely on the contribution of digital processes to the total value generated by the business. Today, business ecosystems thrive under the knowledge economy conditions. The knowledge economy contributes to the ability of organizations to host any number of digital processes and apply them to their business. Entrepreneurs are able to further differentiate their offerings through a digital marketing mix.

As the processes continue to enable businesses, a concern for entrepreneurs becomes how to prioritize current and future needs. It can be tempting to create a process for as many operational and management tasks possible. Digital processes allow for nuances that do not exist with more discrete functions. Entrepreneurs are faced with the decision to prioritize a crowded inventory of processes. Furthermore, assessing the benefits realization attached to additional process may not be immediately evident. An entrepreneur, who can keep in mind the core processes related to true value creation, is positioned to lead their organization through challenging conditions while still serving their core clients and/or customers.

Part of an entrepreneurship frame of references lies in navigating challenges from market conditions' effect on to the internal operations ability to transform concepts and ideas to unique solutions and offerings. As entrepreneurs connect their vision and strategy to execution, often a preceding consideration is to be informed by relative business intelligence to inform the foundational activities. Beyond understanding the competitive landscape, entrepreneurs may seek additional information to provide them an advantage in the marketplace. In some instances, this can mean a better understanding of a customer's journey and attempting to align their products and/or services to specific milestones in that journey. Other examples for entrepreneurs may be to attempt to gain advantage in areas of technical detail they can exploit, an opportunity not yet covered by competitors. Another advantage an entrepreneur can attempt to leverage is by partnering with other similar businesses to create a joint effort to address a market need. The creation of business intelligence then becomes an internal activity that informs entrepreneurs of what may be possible to address their strategic needs. Furthermore, the transformation of business intelligence initiates an innovation process addressing what people, process, and systems may be directed to bring new concepts to fruition.

Embedded processes targeted to support innovation require a desire by leadership to develop additional momentum in fostering a transparent culture open to new ideas. For many organizations, an initial step is to focus on high collaboration activities across the organization. The thought is to generate a collective creativity (Hill et al. 2013) that permeates the organization and influences the way people approach solving problems in the organization. Entrepreneurs are able to help their organizations envision ways to solve problems that are beneficial to the commercial outcomes of the business. While innovation encompasses a wide-ranging set of activities, in general, innovation is an assumed part of the operating model for entrepreneurs.

Innovation as an operating model can act more like cultural norms for an entrepreneurial organization than process enablers. As many entrepreneurial operations grow and mature, the tendency to have a well-developed management system can be overlooked in favor of loosely connected processes. At times this may simply mean the

entrepreneur does not value systems the same way they might value flexibility. While this is not to indicate systems cannot be flexible, it is an example of how perceptions can influence decisions. As a result, some entrepreneurs may value hiring like-minded individuals to help run the business. However, studies have shown diversity can support the creative processes that support innovation. Diversity of perspectives, thoughts, and backgrounds can lead to increased flexibility and novel problem-solving. Entrepreneurs are challenged in balancing the various needs and tensions in order to facilitate growth for their business.

For successful entrepreneurs who grapple with the various internal and external forces impacting their business on a daily basis, finding the right area of the business to invest their time can be challenging. To complicate matters the level of impact to the business can be difficult to discern based on time and competing priorities. An organization may find the best course of action is to reprioritize activities to reduce overall strain on resources and only focus on value-generating activities. Conversely, externalities have similar consequences if not accounted for by the organization. Again, for the entrepreneur from each operational response come the understanding and need to balance initiatives against a quantified cost. Perhaps most difficult of all is the distraction imposed on the entrepreneur seeking out truly value-generating activities for the business.

To pursue new opportunities can be part of the thrill of being an entrepreneur. An entrepreneur may believe that their greatest strength is to apply unyielding passion to solving problems in areas they feel they can most impact. The pursuit of determining how to create or extract value in the business keeps an entrepreneur in an ongoing cycle in feeding their passions. However, entrepreneurs may find themselves in a position of creating problems when none existed to begin with. It is possible that the entrepreneur can end up being required to demonstrate self-restraint in the pursuit of entrepreneurship. The goal would likely be an issue of focusing one's efforts rather than dissuade or dampen the entrepreneur's passion. The impact of being too narrow focused on what evokes interest then may become problematic in maintaining business objectives.

A tension likely exists for the entrepreneur wherein passion is mitigated by a need for structure. Structure can activate a different type of excitement for the entrepreneur. While pursing the role as creator, the entrepreneur may inadvertently put the business in a position whereby it has lost some forward performance momentum. The entrepreneur, who has worked tirelessly to move the organization's agenda forward, may desire a more stable basis to grow the business and by extension their own success. The degree of structure the entrepreneur chooses to focus on may depend on the situation and critical impacts to the business. Also, depending on the skill sets within the organization, the entrepreneur may lean on others to help better control business activities. As activities begin to have better management control, the entrepreneur may shift to a more disciplined mindset. Inevitably, the entrepreneur may switch back to pursuing fundamental needs to generate value. The entrepreneur operates in a cyclical state of tension, which in normal times of business is acceptable and can be managed by those directly impacted by the nature of the entrepreneur.

Critical impacts to a business create new mitigating factors and strains in the entrepreneur's frameworks. The lens by which entrepreneurship highlights the context and concepts of the business, core processes, resources, and the entrepreneur's own tension as important components in reviewing how critical impacts affect the ability to generate value. Furthermore, the actions taken within the organization to respond to critical impacts are amplified by the trade-offs in attempting to achieve a vision and the compromises needed to adjust for the times. Such mitigating factors to success may then warrant consideration cultural dimensions. Therefore, a reasonable expectation for the organization might be to engage in change management strategies throughout events around critical impacts.

## Transformational and Courageous Leadership

The increased frequency of change management strategies within an organization affected by a critical impact event likely will involve a holistic thinking approach and vision to give structure and direction for what comes next. As an entrepreneur connects disparate thoughts to relate their business with possible opportunities, the vision forward eventually materializes. Certainly, when innovative concepts arise that the organization feels can generate new value and the business case made, the entrepreneur and their leaders in the organization embark to execute on these strategies. In doing so, the entrepreneur is set to lead ongoing transformation to the business and organization.

In order to transform the business, entrepreneurs must recognize the organizational shifts necessary and their own contributions in leading these initiatives. While the shifts that require responses to new activities in the organization coincide predominately with the individual needs of the business going forward, the setting for transformation likely will have similarities for other entrepreneurs as well (Bass and Avolio 1994). Similarities around fostering creative insights to innovate, drive and energy, and an awareness for team needs are common priorities leaders in entrepreneurial organizations maintain. As transformation activities intensify, entrepreneurs can expect additional work to focus on keeping team performance high.

Team performance, as a process, can be thought of as a prioritization exercise in gaining alignment throughout a transformation within an organization. To activate team performance when there are a number of changes, entrepreneurs must refocus their framework and thinking on how they might approach changes to their organization (Dionne et al. 2004). As concepts solidify and changes to the operating model align to business performance, if entrepreneurs fail to address how their teams will respond to the changes, the risk of managing the transformation likely increases, and a more dramatic event may lead to business failure. As a response, an entrepreneur might then lean more into leading their organization to ensure the manifestation of their vision across the organization. An entrepreneur would need to enforce a vision that helps their people understand a new landscape. Furthermore, the entrepreneur's vision would require effort to create cohesion within the organization. There needs to be a clear motivation that inspires the organization to accept the new conditions for the business. An entrepreneur may elect to utilize exciting imagery to create inspiration. This can begin with strategic planning sessions to expand the organization's understanding of what the business can be in the future. The entrepreneur guides the visioning and translation into strategy by outlining a new notion of a paradigm they can all achieve together. The consensus that gets built can create the impetus for additional thinking of how to actualize the strategy through well-considered processes that enable further value. Choice points become evident as leadership considers the resourcing needs to support new concepts.

Creating buy-in requires additional grounding for the new ideas to take hold within the organization. Transformational leadership relies on idealized influence in order to further the cohesion within a team (Dionne et al. 2004). Entrepreneurs would do well to understand how their influence helps to model the behaviors and actions within their organizations. During strategic planning, leadership may recognize that what is being attempted will require a shift in how they operate. Discussions may arise wherein it becomes evident that the organization needs to modify how individuals approach supporting the strategy. Training sessions and core competencies may need to be planned out and workshopped throughout the organization. This process may lead to additional consideration for how teams organize themselves and if special resources would be necessary. As activities cascade from the top, the entrepreneur and their leadership team will be looked role modeling behaviors, thus enhancing the cohesion of the transformation. Over time these efforts likely permeate throughout the organization and become fixed as part of the new normal operating model.

While the organization works through sizable changes and the efforts to bring together the various work streams, leaders would do well to recognize additional, more tailor needs to particular individuals. There can be plenty of reasons why the need for specialized actions would be necessary. However, as an entrepreneur faces the possibility of their vision deteriorating before any real momentum is gained, it behooves the entrepreneur to think through targeted communication to connect the past, present critical impacts, and future state. For some, the notion of connecting to the new vision is unclear. This opportunity to address concerns over the plan and changes in process may help the entrepreneur to think through other downstream obstacles or questions directed toward the business. The benefit for all concerned is the validation in confirming alignment as an active part of the transformation process. Teams may require additional follow-up as they encounter niche problems that only affect their part of the business. Another example is the time required to flesh out how innovative ideas become operationalized. These incidents may require more communication and feedback loops than perhaps anticipated and demand ongoing monitoring to ensure forward progress throughout the organization.

The best laid plans can fall short of the objectives without rigor around the transformation process. As much as an entrepreneur's passion empowers the organization to move forward, the opposing tension of adding discipline throughout the organization can counterbalance backsliding effects. To consider the various ideas and initiatives that are required in generating transformation, an entrepreneur likely will need to reconcile what and how their business operations can bridge the current and future state. Each decision needs to be considered, but not all decisions should be considered true choice points. By prioritizing activities that generate value for the business, an organization can embed these activities as core processes moving forward. However, again the tension between forward progress and preventing a breakdown in the business becomes a focus for the entrepreneur to balance. A balance can be struck as opposing elements are worked through with decision-makers and stakeholders within the organization. At times this can clarify roles between parts of the business that overlap in the new structure. There may be times wherein making decisions about how to proceed with translating requirements to meet objectives needs to be iterated on. Ultimately, however, in order to progress through the transformation, the entrepreneur must recognize, be accountable for, and direct abstract concepts to become plans and acted upon to become activities for the business to thrive past a critical impact juncture.

By creating accountability measures, organizational effectiveness should become more pronounced as a staple activity. Individuals involved in transformation activities would have undoubtedly felt the effects of the entrepreneur's effort to manifest their vision (Hill et al. 2012). It would also stand to reason what and how teams reacted to changes would be noticeable. However, as a transformational leader, the entrepreneur would do well to consider how effective the organization can be to eliminate wasted efforts related to such a large effort. The baseline would serve as an indicator for continuous improvement (Lawler 1995). By establishing a clear line of sight connection from the transformation outcomes to the business and strategy, the corresponding organizational design and management can be reinforced through each organizational update.

To coincide with activities that highlight progress made during transformation, the organization should consider sets of standard tasks, or a playbook, to implement. By establishing a standard template by which can be deployed to service-specific outcomes, the results can be standardized and reported for tracking. The traceability of activities helps establish focus even when an entrepreneur has not completely figured out the details for a particular change initiative. The benefit to the business can then be measured and evaluated for future usage. Thus, even a limited, but thoughtful, set of plays may provide enough oversight without becoming overbearing. Some examples of plays include creating feedback processes, focusing on agility initiatives, operationalizing short-term and long-term strategic plans, and integrating winning processes that

have shown to contribute to new value for the business (Worley and Lawler 2010).

Conversely, as the entrepreneur strives to be effective in their transformation effort, the narrow focus may cause some areas of the business to be overlooked. With business pressures likely to be front of mind for an entrepreneur, the desire to force organizational effectiveness in order to optimize time and resources may reduce attention to fringe or moderately measured areas of the business. Small activities are likely to be candidates to be overlooked as it is likely they do not represent key drivers to the business. However, the same logic may allow some entrepreneurs to overlook seemingly minor details in the transformation process. New methodologies in the business are likely to have minor details that are either not well understood by all stakeholders or may unknowingly be a cause for concern for certain individuals. The organization must have a comprehensive understanding of the entire system to avoid risks to the transformation process (Howarth and Rafferty 2009). However, an entrepreneur can instill a perspective with their leadership team to support complementary behaviors such as searching for complete understanding of internal systems.

The complexity around the transforming of a business can create strain in the organization that even with a well-detailed plan may likely require leadership intervention. Entrepreneurs may recognize that with all the changes occurring throughout their organization, the ability to operate without additional problems may be challenging. The operations of the business are often spread and cascaded through various lines of the organization. As activities span further away from the entrepreneur's immediate control, instances where the entrepreneur's understanding, assumptions, and expectations of transformation activities can be questioned. To verify understanding, challenge assumptions, and level set expectations, the entrepreneur can adopt a courageous leadership approach in an effort to counteract their own zealous pursuit of transformation. During the transformation process, an organization will be stepping out of their comfort zone and can benefit from ensuring the kind of dialogue needed to support the change is happening throughout the organization (Beer 2020). The entrepreneur should endorse and hold their leaders responsible for engaging the right people at the right time with the right topics. This means leaders should be engaging in honest dialogue with individuals whose work is most affected by the changes, to ensure that individuals closest to the problems that are being worked on have contributed to the solution. Furthermore, if gaps exist in the transformation plans, leaders must find ways to reconcile their own thoughts and agendas with certain realities. Leaders may find that changes may require more in-depth, systematic updates but that the lessons learned through discovery may provide a better strategic execution option.

Being courageous means being open to a different view of the problem and solution without becoming accusatory. By adopting practices that help facilitate courageous leadership style, the organization is signaling the importance of the collective over individualism. Entrepreneurs are able to empower their leaders to confront difficult issues and hold them accountable to resolve conflict. Thus, the way leaders can then inspire trust with their teams can be driven from a place of personal and shared understanding. By allowing individuals to participate fully in the transformation process, entrepreneurs can be more assured that the commitments and activities flowing through the organization can represent reliable milestones toward progress.

## Conclusion

The perspectives shared as a review of current models and frameworks that are being applied critical impact events, such as a global pandemic, reveal additional research may be necessary to provide additional structure to the themes discussed. The growing crossover literature in the fields of entrepreneurship, transformational leadership, and organizational effectiveness may contribute to specific topics that may add insight into how work streams can utilize findings for their benefit. With uncertainty bound to provide opportunities to researchers interested in trying to

help entrepreneurs make sense of critical impact events, the rise in studies focused on geographical and demographic segmentations. Furthermore, the subject around contemporary social and environmental topics presents a potentially much larger lens to include for study. By examining the current environment using the same cascading review approach, future bodies of work may find greater synergies in this area and evolve an understanding of critical impacts to entrepreneurship and leadership activities.

## Introduction

During the 2019–2020 academic year, four faculty members taught 27 classes between them in the areas of education, healthcare administration, and management. The students enrolled in these graduate courses would go on to become first-time managers, middle managers, or were changing their career focus to enter a new career phase. The total number of students was 540 and they hailed from eight international countries and the United States. The students were outstanding in their course work, but their main deficit was knowledge about themselves and their leadership style.

Bolman (2020) indicated a vital element of leadership is the ability to see what is coming. Since the future is inherently uncertain, that means one needs to study what is happening, see where current forces demanding attention in the world are, and make appropriate choices. It is even more imperative that first-time leaders understand their managerial skillset and organizational fit.

The researchers used the Leadership Orientations Self-Assessment test on Lee Bolman's website to provide a baseline for the students about their leadership style. The test asks a series of questions that allow the students to determine which of the four different conceptions of organizations and of the task of leadership they fit into. Bolman and Deal (2008) present the four frames – Structural, Human Resource, Political, and Symbolic – as a means for students to self-assess. Originally published in 1981, Bolman and Deal has become a cornerstone in public service and administration for considering different types of organizations and now the kinds of leaders that are best aligned to be effective in these organizations. This simple breakdown of four frames or types of organizations, namely, structural, human resources, political, and symbolic, help business leaders and managers continually rethink and reframe their organizations.

More specifically, the structural frame represents traditional factory-design organizations and social architectures that promote clear missions, roles, and goals that can include tasks for implementing technology and improving the overall work environment. The human resources frame demonstrates a more personal, family, and relationship-style of organizations that considers the needs and skills of employees and empower them for continued development. The political frame exemplifies the kinds of organizations that promote advocacy and political ideologies with keen attention toward power, politics, competition, and even conflict. The symbolic frame illustrates organizations of inspiration that produces a collective culture through stories and metaphors, and recognition of heroes, champions, and images of success and ceremony.

The journal authors repeat the definitions of the Four Frames below for expediency.

| | |
|---|---|
| **Structural** | This Frame focuses on the obvious "how" of change. It is mainly a task-orientated Frame. It concentrates on strategy; setting measurable goals; clarifying tasks, responsibilities, and reporting lines; agreeing metrics and deadlines; and creating systems and procedures. |
| **Human Resource** | The HR Frame places more emphasis on people's needs. It chiefly focuses on giving employees the power and opportunity to perform their jobs well, while at the same time, addressing their needs for human contact, personal growth, and job satisfaction. |
| **Political** | The Political Frame addresses the problem of individuals and interest groups having sometimes conflicting (often hidden) agendas, especially at times when budgets are limited, and the organization must make difficult choices. In this Frame you will see coalition-building, conflict resolution work, and power-base building to support the leader's initiatives. |
| **Symbolic** | The Symbolic Frame addresses people's needs for a sense of purpose and meaning in their work. It focuses on inspiring people by making the organization's direction feel significant and distinctive. It includes creating a motivating vision and recognizing superb performance through company celebrations. |

## The Four Authors

The writers are in various stages of their professional careers, so they used themselves as a benchmark to better advise students who seek their counsel. A thumbnail sketch of their careers follows.

Joanne Howard, 30 years of nonprofit and educational management with 20 years of teaching experience. Dr. Howard scored the highest in the Human Resources Frame.

Diane Howard, 30 years of senior positions in healthcare operations; association

management; insurance marketing; and 16 years of teaching experience. Dr. Howard scored high in the areas of Political and Human Resources Frames.

Leodis Scott, midcareer university faculty member with military experience. Dr. Scott scored highest in the areas of Structural and Symbolic Frames.

Angela Freeman is a doctoral student with program management experience with a master's in public health. She scored high in the Structural Frame area.

## Reflections on Past Experiences and Key Lessons

The authors are in different generations: Howard and Howard are Baby Boomers, Scott is in Generation X, and Freeman is a Millennial. The authors were born and raised in New Jersey, Illinois, and Michigan, respectively. The characteristics they share are growing up in stable families with high achieving parents; they are African American; and each suffered the loss of a parent at a young age. The similarities bear mentioning as they each indicated it had a bearing on their desire to control their personal and professional lives. They understood at an early age that life is fleeting; opportunities present themselves, and there is an urgency to take advantage of them; and, most importantly, that sacrifices had been made for them and there *must* be a return on this investment. The return is passing wisdom and lessons learned to another generation.

Berman (2010) indicated in *Making a Difference* that to successfully lead nonprofit enterprises is a management challenge, and the following attributes of leadership play an essential role: integrity, independence, mature confidence, corporate manners, a sense of context, courage, and commitment.

Salamon (2003) reflects on the changing context on nonprofit leadership, and by extension, for profit management, that challenges and opportunities are presented daily. All organizations, regardless of their tax status, must content with fiscal challenges, competition, effectiveness, and technology. The opportunities should also be front of mind and new, mid-career, and senior managers must exhibit leadership prowess in dealing with social and demographic shifts. The nonprofit and private sector organizations that have had the agility to pivot to embrace current social issues (LGBTQ rights, Black Lives Matter, the new push for Voting Rights, for example) will be the better for it and road tested for changes to come.

## What They Learned from Their Students

The students the faculty taught during the 2019–2020 school year are divided into large categories to protect the participating students and the respective universities where the faculty currently teach:

| Gender | |
|---|---|
| Male | 221 |
| Female | 298 |
| Non-conforming | 21 |

The students were from China, Korea, India, Nigeria, Russia, Saudi Arabia, Taiwan, Turkey, Ukraine, Viet Nam, and the United States. The age range was 23–36 years of age. Surprisingly, the students had many similarities: they were all ambitious, had capitalistic tendencies, loved hip hop music, loved to travel, and were overly dependent on social media to keep themselves informed. The internet provided an interesting way to break down barriers during classes, and the faculty witnessed substantial social cohesion among the classmates at their respective schools.

The key elements that helped to unite the students were current events, food, information-sharing about campus social events, and other sources of entertainment. Anecdotally, the authors found the students to be far more collaborative than the authors found themselves to be when they were in graduate school. This younger generation is disrupting the way learning occurs in higher

education; and they are more vocal about how they want to learn, be taught by, share classroom and campus space with, and what they want their future world to be, and, they want immediate action. Organizations that are slow to adapt to the needs of this younger generation do so at their own peril. There are ways that multiple generations can acclimate their leadership styles to coalesce around organizational values.

## Intergenerational Learning

The Leadership Competency Model is divided into the three domains of people, execution, and transformation (Calhoun et al. 2008). The competencies advanced by high-achieving professionals and organizations relate to 26 behavioral and technical competencies as individuals progress through their careers from entry-level to mid-level and advanced stages of lifelong development (Calhoun et al. 2008). In the early phase of a career, the People domain of the leadership competency grid is critical because the professional needs to have interpersonal understanding of their motivations and aspirations. The emerging leader must take responsibility to understand their impact on others and to improve their capabilities, as well as the capabilities of others (Calhoun et al. 2008). The individual needs to focus on advancing the interpersonal understanding of who and what they are and want to become (Fig. 1).

In the People domain, the organizational leader has optimal human resources to recruit and retain good staff. The leader and staff could hear and understand the thoughts, feelings, and concerns of others. Professionalism is the ethics and values that a leader displays and infuses the organization. The leader is also someone who is good at relationship building and exudes self-confidence. The leader invests in the development of themselves and staff and seeks out talent to develop the breadth and depth of the organization. The organization also functions as a team with members complementing each other in how work is accomplished.

In the Execution domain, the leader takes the vision and strategy of the organization to drive organizational performance (Calhoun et al. 2008). The competencies include accountability, change leadership, collaboration, impact and influence, and initiative as behavioral skills to develop in this domain. In addition, technical skills in information technology management, performance measurement, process management and organizational design, and project management are critical to professional development in this domain.

As the professional develops and broadens their scope of responsibility, a higher order of leadership is required in the Transformation domain, which includes visioning, energizing, and stimulating change processes (Calhoun et al. 2008). The Transformation domain includes the behavioral skills of achievement orientation, community orientation, innovative thinking, and strategic orientation. The technical skills of financial and analytical thinking are contained in this domain (Calhoun et al. 2008).

Transformational Learning addresses the external environment in which the three model programs operate. It addresses the broader community that includes economics, social supports, and education. There is an organizational advocate, whose leadership style is coalition and building. The advocate clarifies what they want and what they can get; they assess the distribution of power and interests; they build linkages to other stakeholders; and they use persuasion first, then use negotiation and coercion only if necessary (Bolman and Deal 1997). In the context of student learning, the student must interface with the external environment as they apply their skills to the world of work.

With multiple generations in the workforce, it is incumbent that senior and junior managers engage throughout various organizations for significant exchange of ideas to flourish for the mutual benefit of private sector, nonprofit sector, and governmental organizations.

## Conclusion

Newly minted graduates of management-oriented professional schools with limited managerial experience have a vested interest in determining

**Leadership Styles: Choose Early, Fig. 1** NCHL competency model

their leadership styles. With the advent of a global pandemic and the contraction in many industries, there is a need for new thinking and ideas to infuse the workplace. Dalio (2017) and Butler (2019) list lessons learned in their professional and personal lives that can serve as a benchmark for younger generations. Mistakes recorded are ones that individuals choose not to replicate.

The primary step for first-time managers is to determine their leadership style and to be cognizant of their mistakes and successes. The road to transformative leadership is long and continuous. Execution for results and people with strong interpersonal skills are critical to the strategic management. It is incumbent upon senior managers to provide an environment for information-sharing to enhance the competencies of junior managers. It is also important for junior managers to work with senior managers to advance their innovative thinking to work for continuous improvement.

What we present here is the opportunity for potential leaders to consider their personal characteristics in alignment with the best suited type of organization. NCHL Competency Model features the intersectionality of people, execution, and

transformation domains. The combination of characteristics listed within each domain will differ depending on the type of organization potential leaders choose to enter. Our research notes that in the domain of execution, a structural organization would mostly benefit, whereas in the people domain, a human resources organization would appear most effective.

However, in the transformation, our research suggests that these related characteristics would best be suited for both political and symbolic types of organizations. This point further supports the importance of transformational leadership that transcends beyond execution and people but bring about a higher degree of analytical and innovative thinking.

Finally, in our advocation for leaders to consider taking the Bolman Leadership Orientations Self-Assessment Test, we are not suggesting that misalignment of leadership style and type of organization is immediately problematic. Rather, we contend that knowing what your dominant characteristics are will allow leaders to connect and relate to others in the organization that display those significant characteristics that may be different than yours. In this way, learning about your leadership style and the organization type will lead to more effective teams, organizations, and management overall.

## Definitions

Leadership has become a central concern within the public sector in the last decades of the twentieth century (OECD 2002). Various causes have driven top civil servants to different roles, compared to the Weberian hierarchical model of public administration, prevalent in the early and mid-twentieth century. Although these factors cannot be generalized throughout all countries, certain conditions became common trends affecting governance: globalization, ICT, diversified and fragmented societies, decentralization of government, turning public management far more complex than before. In a short definition, leadership can be conceptualized in such terms: "*Administrative leadership is a composite of providing technical performance, internal direction to followers, external organization direction – all with a public service orientation.*"(Villoria and Iglesias 2011). Therefore, public leaders are expected to: obtain results, understand the context within which they operate, develop new and innovative working patterns, and inspire to get convergence of efforts. Within a world of rapid change, they are expected to facilitate adaptation in order to make the public sector give effective and efficient responses to society's demands. A wider

definition of public leadership can also include middle managers and operational supervisors.

## Introduction

Brazil is a federation, and therefore, the Brazilian public administration comprises the Federal Government, state (26) and municipal governments (5570), and the Federal District. Public officials were distributed in 2016 such as:

| | Number of public officials | Number of public official per 1000 inhabitants |
|---|---|---|
| Federal Government | 1,081,600 | 5.2 |
| State governments and the Federal District | 3,120,000 | 15 |
| Municipalities | 4,992,000 | 24 |

Source: Dapp.fgv.br/estado brasileiro

A Weberian civil service started to be created under President Getúlio Vargas, 1937; but it took several decades till the idea of an impersonal and meritocratic bureaucracy took ground and became widespread. Patronage was very common during the democratic period (1945–1964). Under the military regime (1964–1985), Government concentrated mostly on developing the country infrastructure, which was implemented through state-owned enterprises (SOEs). A new perspective aroused with democratization and was reflected in the 1988 Constitution. The "Citizen Constitution" intended to be a tool to overturn Brazil's resilient social inequalities through the creation of a welfare state.

At the same time, legislators intended to finally strengthen the institution of an independent and professional bureaucracy, selected exclusively by meritocratic criteria in public selection processes (Levy and Coelho 2018). In parallel, the 1988 Constitution maintained the possibility of hiring on "confidence" grounds; these are the "*cargos comissionados*" (commissioned posts) for managerial or advisory purposes. The commissioned posts can be held either by public officials, in strict sense, or by individuals who do not belong to the civil service. To a certain extent, "*cargos comissionados*" are equivalent to political appointees. But because of their number and managerial content, they widely surpass the concept of political appointees, by comparison with countries within the Westminster model. Undoubtedly, those individuals occupying *commissioned posts* are the top officials of the Brazilian public administration and therefore are supposedly the *public leaders*. Because of the multifaceted nature of these *commissioned posts* – ranging from political advice to highly technical expertise or strategic management capacity – it becomes difficult to draw a line differentiating professionals from politically appointed officials. Politicization can become very *intense.*

## Coalition Presidentialism and *Commissioned Posts*

The top level of the Brazilian public administration (in all levels of government) and its performance is highly impacted by the features of the relation between the Executive and Legislative, named as "coalition presidentialism." According to Pereira and Pessoa (2015), *"the political management of Brazilian presidentialism includes the size of the coalition, its ideological dispersion, the distance to the average ideology of Congress and the proportionality in the distribution of ministries."* The larger the coalition – in terms of number of parties – and the wider the ideological dispersion of its components, the harder it is for the Executive to manage the coalition and obtain majorities in Congress. In order to do so, the ruling party must share ministries and/or *commissioned posts* with their partners in the coalition. Designating individuals appointed by the coalition partners to these various posts is a way to co-opt these parties; another reason to appoint on politically allegiance grounds is the need of the ruling party to control its coalition partners when or where power has been delegated.

In the Federal Government, around 3% of positions were *cargos comissionados* in 2016, allowing the President full discretion over their hiring.

The number is greater if posts in the SOEs are also taken into consideration. According to Alessio (2017), in 2016, there were:

Positions appointed by the president with full discretion

| | |
|---|---|
| DAS system (senior and middle managers and advisors leading ministries and foundations) | 19,441 |
| IFES (federal universities and three foundations) | 8,261 |
| Regulatory agencies | 3,242 |
| All positions (includes positions within SOEs) | 99,122 |

Source: Alessio (2017)

The landscape is quite uneven. From 1999 till 2014, the number of outsiders who occupied DAS positions has decreased from 44% to 30%. Actually, more positions were designated to federal civil servants, including at higher echelons. Around 24% of federal civil servants and 51% of outsiders were affiliated to political parties under Lula (2003–2010). The presence of outsiders occupying these positions differs from ministry to ministry: Finance and Foreign Affairs had over 90% of these positions occupied by civil servants, while Cities Ministry had only 25%. In addition, a special category of *commissioned posts* has been created: the *commissioned functions* (*funções comissionadas*) which are only meant to be occupied by civil servants.

Coalition partners have shown more interest in positions with high tendency to regulate and/or manage significant budgets. Most of all, they showed their interest – especially under Lula and Roussef, whose coalitions were larger and ideologically more heterogeneous – in strategic posts of large SOEs, such as PETROBRAS.

Some perverse consequences derived from this patronage system. In the case of ministries and public organizations in general, *a high turnover* – 30% per year, in average – (Lopes 2015) of top level managers, with dreadful impacts in the implementation of public policies.

In SOEs, very high levels of *corruption* were carried out. The "Mensalão" crisis (2005) and *Carwash Operation* (2014) were able to reveal diversion of billions of dollars, leading several businessmen and high rank politicians – including President Lula – to prison.

## Strategies Developed to Improve Leadership and Overcome Patronage

In contrast with little attention given to performance when designating top managers at Federal and state governments, hiring new and competent public officials has been very intense after 2003. Competitive salaries at the Federal level attracted talented youngsters from all over the country. The number of undergraduate courses on Public Management rose from 10 in 1995 to 200 in 2010 producing capable candidates for the public sector (Fadul et al. 2014).

On the other hand, many steps were taken in order to protect *commissioned posts* from political seizure: under Roussef, 75% of lower level posts (DAS1, 2, 3) were reserved to civil servants, as well as 50% of DAS4. The total number of DAS positions that could be fulfilled by outsiders decreased further more under President Temer (2016–2018) to 15,234.

Alessio (2017) points to some additional conditions to designate some of these posts:

- In the case of universities, officials must be elected by the academic community, having the President the final word, for instance, on the chancellor's choice.
- In case of regulatory agencies, top officials have to be examined by the Senate.

Only in the 30 federal research institutes managerial capacity is taken into account, when selecting their leaders through search committees are responsible for selecting the top level managers is in 30 scientific institutes.

At state level, some important initiatives have been taken in order to build a performing top management. In São Paulo (Alessio 2012) and Minas Gerais (Ávila et al. 2013), for instance, middle managers in Health and Education sectors started to be hired after getting a certificate on managerial competences.

Minas also started hiring strategic managers for complex projects, through headhunters. Goiás introduced selective (blind) processes to hire their middle managers.

A significant investment has been made in training, especially for middle managers at Federal and state level (The situation in Municipalities is not being considered because the difference between them – size, performance, resources – is very big; there is also scarce research on local realities.). ENAP, the National School of Public Administration, coordinates and integrates over 200 schools of government.

## New Developments Coming from Civil Society

Poor public services have been at the heart of huge demonstrations all over the country in 2013. Low levels of productivity in the public sector started to raise civil society's attention. A series of innovative initiatives have emerged in the last years; among them, the following can be mentioned:

- Brazilian Movement for Competitiveness (MBC), sponsored by businessmen, is linked to advocacy in favor of Good Governance, giving also support to governments to increase its efficient use of financial resources and stir results based management.
- Vetor Brasil selects leaders for top-level posts and hires trainees for temporary work.
- The Council for Public Leadership (CLP) is also sponsored by a group of businessmen; it works on the side of advocacy and training of active top level officials, developing leadership competences and creating a national network of public leaders.
- Lemann Foundation, a family foundation, committed to the advancement of Public Education in Brazil, is lately supporting the cause of hiring public leaders through selective processes and tying their work to the achievement of results.

These initiatives certainly change the traditional context for the public sector: new stakeholders, other than political parties, start to have wider influence on its performance.

## Conclusions

The corruption scandals have produced an enormous impact on society and their political views. Political parties and politicians are trying to give new answers in Parliament and in Government.

Seven state governors, recently elected, have signed an article published in "Folha de São Paulo" entitled "*We have to attract the best, managers are crucial for the public sector*. . .."

> It is time to modernize the way we select our leaders. This means we have to combine confidence and the necessary competences. Therefore, although confidence and politics are fundamental to choose our leaders, we have to guarantee that a professional pre-selection takes place. (Hartung et al. 2018.

At the Federal Government, recent elections have produced a significant political shift to more liberal conceptions. "New politics," claimed by the winning coalition, are intended to decrease direct political parties influence on the Executive through *commissioned posts.* A more technical profile of ministers is being sought and a handful of ex-military are replacing posts traditionally occupied by politicians.

The spirit of the 1988 Constitution has produced significant advancements in building a professional and qualified civil service. Legislators believed that the mere existence of a civil service would allow public services to improve and would create a shield to protect government from patronage. But fragmentation of the party system has led the Executive to negotiate posts, with no programmatic commitments. The Legislative has not acted as principal, asking for the Executive's accountability for results. These are low incentives for a performing public sector. It is very soon to evaluate recent developments. Society's outcries and organization may reverse an appalling historical curse.

# Leadership, Conflict, and Knowledge Sharing in the Public University

José Luis Ballesteros-Rodríguez, Nieves L. Díaz-Díaz, Inmaculada Aguiar-Díaz and Petra De Saá-Pérez
Departamento Economía Financiera y Contabilidad, Universidad de Las Palmas de Gran Canaria, Las Palmas de Gran Canaria, Spain

## Synonyms

Disagreement and conflict at public universities; Leadership at public universities; Public universities knowledge management

## Definitions

Task-oriented leadership refers to those leader behaviors that facilitate the understanding of task requirements, operating procedures, and the acquisition of task information. Relationship-oriented leadership refers to those behaviors regarding concern and respect for followers, looking out for their welfare. Task conflict is a perception of disagreement that involves differences in viewpoints, ideas, and opinions about the task being performed. Relationship conflict is a perception of interpersonal incompatibility among individuals, related to disagreements about values and personal issues. Knowledge sharing refers to deliberate interpersonal interaction processes, such as discussions, exchanging ideas, or joint problem-solving, where knowledge is exchanged.

## Introduction

Knowledge management practices within public universities are becoming an important issue because they can help to increase universities productivity, in particular, scientific production. However, research carried out at public universities largely depends on effective collaboration for knowledge sharing among academics. In this regard, the success processes related to the Nonaka's SECI model of knowledge occur at the research group level, because researchers must know and trust each other to exchange their knowledge (Nistor et al. 2015).

In academic institutions, researchers obtain much of their knowledge through interactive face-to-face communications, rather than from written documents (Tan 2016). Thus, knowledge sharing among researcher could lead to better performance. However, people may have reasons for not making their knowledge available to others, treating their knowledge as a valuable and sensitive asset that must be carefully handled (He et al. 2014). For this reason, it is critical to understand the underlying effects of the collaboration among researchers and their willingness to share knowledge with others. In this sense, knowledge sharing can be fostered if leaders show

certain behaviors related to knowledge management activities, convincing their group members that the exchange of ideas is beneficial for everyone (Tian et al. 2009). Besides, leaders can also help by reducing hoarding behavior, which generates high levels of conflict and trying to inspire group members to share knowledge (Bai et al. 2016).

## The Influence of Leadership on Knowledge Sharing

In the university context, research is motivated by the individual objectives of academics, who may choose whether or not to share knowledge, but also with whom. For that reason, the knowledge-sharing process becomes challenging and cannot be arbitrary manage (He et al. 2014). In this way, it is necessary to emphasize the role of university laboratories' leaders, who should promote a culture that fosters knowledge sharing, by convincing their group members that an open debate could be beneficial in terms of publications and citations (Tian et al. 2009). Leaders can help to eliminate hoarding behavior and try to inspire group members to share. Thus, knowledge sharing can be fostered if leaders have certain behaviors directly related to knowledge management activities. Examples of these behaviors could be: monitoring the environment for relevant new knowledge to share it within the group, challenging group members to try new approaches to problems, and pairing experienced individuals with less experienced members (Lee et al. 2010).

From a behavioral perspective, leadership styles can be divided into two categories: task- or relationship-oriented. A task-oriented leader deals with task accomplishment and facilitates the understanding of task requirements, operating procedures, and the acquisition of task information. A relationship-oriented leader facilitates behavioral interactions, cognitive structures, and attitudes that must be developed before members can work effectively as a team. This kind of leader shows concern and respect for his/her followers, looks out for their welfare, and expresses appreciation and support (Bass 1990).

## The Influence of Conflict Types on Knowledge Sharing

In universities, academics collect and offer knowledge at different times and in different contexts. Sharing knowledge means that researchers have to invest time and effort in encouraging the flow of knowledge among their group members, who have different types of specialized expertise. This process enhances group conflict when members discuss their different points of view using arguments and counterarguments (Jiang et al. 2016). In this sense, task conflict is a perception of disagreement among group members about the content of their decisions, and it involves differences in viewpoints, ideas, and opinions about the task being performed. Relationship conflict is a perception of interpersonal incompatibility among individuals, related to disagreements about values and personal issues (Jehn et al. 2008). Both types of conflict can be seen in group members' moods, which may be expressed as negativity, irritability, and resentment on a personal level. However, although conflict has generally been viewed as unfavorable, a particular type of conflict could be beneficial because, in certain circumstances, task conflict can increase effectiveness. Groups that experience task conflict tend to make better decisions because this conflict encourages greater cognitive understanding of the issue being considered and the acceptance of group decisions, and it prevents groupthink. However, if the level of task conflict becomes so intense that information processing is blocked, this positive effect is reduced. Thus, if task conflict is not well managed, it can also be destructive to knowledge sharing (Bai et al. 2016; Jiang et al. 2016).

Although it is clear that knowledge-sharing processes have a cognitive nature, it must also be recognized that they have an essential relationship component. For knowledge sharing to exist, there must be emotional ties linking the group members because a positive attitude towards knowledge sharing requires the presence of social relationships based on trust. Thus, relationship conflict can be an obstacle because it hinders open communication and fosters hostility and suspicion

about others' ideas and arguments, drastically reducing the group's information processing ability (Lu et al. 2011).

## How Can Leadership Influence the Conflict to Encourage Knowledge Sharing?

The research group's performance is closely related to the leader's behavior because some members may be linked to the research group for a relatively short time, focus mainly on scientific issues, and not have much of an opportunity to get to know each other (Nistor et al. 2015). In this context, conflict is inherent to the interactions that occur within a group. But this conflict does not appear spontaneously or unjustifiably, and the way the leader manages conflict will have a substantial impact on the group's performance.

Leaders must help members to minimize the likelihood of reaching dysfunctional conflicts, seeking the right group environment that can stimulate creative chaos. This aim can be achieved through different leadership styles or behaviors. Leaders with task-oriented behavior often serve as examples for team members, reducing the negative consequences of task conflict by focusing on goal achievement and establishing well-defined patterns of communication (Bai et al. 2016). Moreover, team members who perceive a greater task-oriented leadership style experience positive emotions toward their colleagues more frequently, thus reducing relationship conflict. By contrast, a leader's relationship-oriented behavior will help to maintain or control an appropriate level of conflict by establishing good interpersonal relationships within the team to prevent both task and relationship conflicts.

## Conclusion

Knowledge sharing has become an element of interest for all kinds of organizations that try to build on knowledge to achieve a competitive advantage. This interest is even higher in public organizations such as universities because their purpose is the creation and transfer of knowledge to society. In this regard, leaders' behaviors (task- or relationship-oriented) is a critical issue to consider because they have a direct, positive, and significant effect on knowledge sharing, as well as an indirect impact by reducing the negative impact of high levels of task and relationship conflict. Therefore, leaders can play a pivotal role in knowledge-sharing activities within research groups in public universities because they can create an environment of positive interactions among group members in order to facilitate knowledge-sharing activities, which, in turn, contribute to the creation of new knowledge (Rotolo and Messeni-Petruzzelli 2013). Knowledge sharing can be encouraged by fostering social interactions and stimulating interpersonal relationships that minimize conflict and improve proper behaviors among group members (Bai et al. 2016).

## Lessons for Public University Managers

In the public sector, and in particular in public universities, it is necessary to shed light on understanding the knowledge management process. Managers in private companies have different tools and mechanisms to promote knowledge management practices in their organizations that may not be available to those who have similar positions in public organizations. Thus, the proper management of knowledge sharing in research groups can benefit management processes in universities as knowledge creation and dissemination centers. It should be noted that knowledge sharing has positive connotations for academics, which tend to view it as a valuable and pleasant experience. In other words, researchers believe that engaging in knowledge-sharing activities can be advantageous because it also has intrinsic rewards. This enjoyment is closely linked to the researcher's mood, which can be significantly undermined by the existence of high levels of conflict within the group.

Public universities should create a proper context where individuals feel motivated to engage in sharing knowledge. People in charge of public universities should consider the need to improve

the leadership skills of academic's leaders because these they can help to create better conditions for knowledge sharing among academics. Besides, it should be noted that, within the academic context, a person who is considered "an expert" could lead a research group without having the appropriate leadership expertise, skills, and knowledge. Therefore, public university decision-makers should actively improve the leadership skills of these academics. This recommendation is reinforced by the fact that the issues addressed in this entry affect issues that are not related to the recruitment, compensation, or career planning fields, which usually are beyond the reach of research group leaders in public universities. In this sense, this entry highlights the need to focus on the aspects of human resources management that could be within the sphere of influence of academic research group leaders. Thus, through an adequate training program, public universities could help research leaders to manage their human resources better and promote higher levels of knowledge sharing, without having to modify incentive and reward systems. In universities and other public organizations, training programs could improve group leaders' interpersonal skills, so that they can be in a better position to prevent unpleasant situations within the group that can hinder knowledge sharing. Also, the content of training programs could help leaders to directly impact knowledge sharing because it might help them to find a proper strategy to foster knowledge sharing. Training can help them to identify and assess knowledge-sharing barriers and opportunities and develop an appropriate way to cope with the former and achieve the latter. Training programs could also improve the necessary communication skills to better transmit the importance of knowledge-sharing activities for the benefit of the whole group.

In conclusion, knowledge management can significantly contribute to effectiveness in public organizations. In this regard, this entry broadens the literature on knowledge management in public universities by addressing how the leader's role directly influences knowledge sharing. It also extends the literature by showing how leaders of public organizations, such as universities, can indirectly contribute to knowledge sharing, by reducing the harmful effects of task and relationship conflicts. In this way, this entry provides managers of public universities with interesting notions about leadership roles they have to foster to take advantage of knowledge as a strategic resource.

## Synonyms

Ethical decision-making; Leadership style; Moral managers; Problem solving; Transformational leadership

## Introduction

The leadership, ethics, and decision-making nexus is complex; yet many scholars posit a direct relationship between ethical behaviors influenced by leaders and enhanced organizational performance (Brown and Treviño 2006; Detert et al. 2007; Ehrhart 2004; LePine et al. 2008). Furthermore, given the aggregate number of issues encompassed within the term "ethics," there are few management decisions free of any ethical component. Decision-making is embedded in the concept of leadership, as those who have the authority and the ability to make informed, well-reasoned, and timely decisions are often viewed as leaders. Early research in the field of organizational behavior established an understanding of decision-making processes as essential to an understanding of the behavior of organizations (Cyert and March 1963; March and Simon 1958). Despite such a clear overlap, leadership, ethics, and decision-making are often discussed in isolation from one another or through paradigms that propose relatively new concepts rather than integrate existing ones. However, through an analysis of well-established paradigms in each of these areas, as well as the leading thought on ethical leadership and ethical decision-making, a clear depiction of the interdependency among leadership, ethics, and decision-making begins to emerge.

More specifically, decision-making is a dynamic mechanism through which ethical leaders influence ethical behavioral outcomes of group members. To understand how this relationship functions, it is important to distinguish between the two widely established components of ethical leadership: moral person and moral manager. A leader who is moral person and self-identifies as a moral person or possesses a moral identity is more likely to integrate ethics into their decision-making processes and, thus, produce ethical outcomes. A moral person is someone seen as possessing trustworthiness, integrity, and honesty. As a moral manager, a leader will inform the decision-making of group members by role-modeling behavior as a moral person, communicating relevant information, as well as strategically using rewards and punishments to develop group members' capacity for ethical decision-making on their own (Treviño et al. 2006). This chapter will present and discuss the research on how leaders can establish themselves as moral people and moral managers.

## Theoretical Frameworks: Ethical Leadership and Ethical Decision-Making

Decision-making is embedded in the intersection between ethics and leadership. Based on leading research in the area, Brown and his colleagues define ethical leadership as "the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcements, and decision-making" (Brown et al. 2005, p. 120).

### Moral Versus Amoral and Immoral Management

Immoral managers make decisions that are discordant with the ethical standards of an organization or society, in general. They actively choose options or adopt behaviors they know to be unethical in order to pursue some other aim. An

L

immoral manager's motives are often selfish and unsupported by any moral philosophy. At the extreme, they do not consider stakeholder interests, unless these interests benefit the manager, when making decisions, and show little regard for those who stand between them and their interests.

It is important to note that moral management stands in contrast to not only immoral management, but amoral management. Amoral managers that simply fail to recognize the moral components of decision-making in organizations can do so intentionally or unintentionally. Perhaps not as nefarious as immoral managers, amoral management can be just as damning ethically to an organization.

Intentionally amoral managers believe that business decisions can be isolated from ethics and intentionally exclude any ethical considerations from factoring into their judgments. Unintentionally amoral managers lack the moral awareness and ethical perception needed to realize the ethical components of decisions. Regardless of intentionality, amoral managers fail to provide the ethical guidance their organizations need.

### Ethical Decision-Making Models

Ethical decision-making models provide a framework for understanding the specific ways in which leader qualities and behavior affect certain behavioral outcomes among organizational members. Closely aligned with traditional decision-making process models, Rest (1986) outlined a process for ethical decision-making based upon four steps: moral awareness, moral judgment, moral intention, and moral action or behavior. The initial moral awareness step, similar to problem identification in the rational decision-making model, recognizes the moral aspect, dilemma, or component of a situation. The moral judgment step, encompassing the establishment and evaluation of criteria and alternatives, involves deciding whether potential actions are ethical. Intention, or the selection of a moral alternative over others, establishes the goal of moral action. Finally, behavior, or implementation, describes engagement in ethical actions. Throughout this process, variables related to the individual, organizational, or situational context and moral intensity of the issue moderate and mediate outcomes. This framework is useful for understanding both how a leader makes ethical decisions and influences those of others.

Moral intensity plays a moderating role throughout the decision-making process. When the magnitude of consequences is great, social consensus is strong, probability of effect is high, temporal immediacy and geographical proximity exist, effect is concentrated, decision-makers self-identify with those affected by the decision, and resultant moral intensity is shown to lead to greater moral awareness, better moral judgment, moral intent, and moral action (Brown and Treviño 2006).

## Leaders as Moral Persons and Ethical Decision-Making

Leaders are seen as moral persons when they demonstrate certain traits, behaviors, and decision-making patterns. Critical traits include integrity, trustworthiness, and honesty. The corresponding behaviors generally reveal a concern for other people, openness, and a personal morality (Treviño et al. 2000). While it is important that these traits and behaviors be recognized as ethical from an external perspective, a leader that self-identifies as a moral person – otherwise known as having a *moral identity* – will more successfully make ethical decisions and influence others to behave in ethical ways (Mayer et al. 2012). Indeed, studies reveal moral identity to be a robust indicator of organizational ethical outcomes (Mayer et al. 2012).

### Moral Person and Awareness

The literature establishes several mechanisms through which a leader's moral person influences the decision-making process. In the initial stage, a person that self-identifies as ethical will have greater moral awareness, or the ability to recognize the ethical component of an issue or decision. According to Lapsley and Lasky, a person who has a moral identity is "one for whom moral schemas are chronically available, readily primed,

and easily activated for information processing" (2001, p. 347). Thus, leaders who are moral persons will naturally consider relevant ethical issues when making a decision or at a minimum recognize where a moral dimension might need further consideration.

Moral awareness assumes an above-average familiarity with a broad range of ethical issues. However, there are leaders considered to be moral persons that simply have never been exposed to certain issues or had cause to consider them. Moral persons aiming to be ethical leaders can employ certain strategies, such as stakeholder engagement or participative decision-making, to counteract deficiencies in moral awareness.

### Moral Person and Judgment

The judgment stage of the decision-making process is influenced by the cognitive thought processes of a moral person, or moral judgment. Kohlberg's (1969) theory of cognitive moral development proposes three levels of development to differentiate the reasoning processes used when making moral judgments. A moral person can be said to have advanced to the final or postconventional, autonomous, principled level within Kohlberg's moral development schema. Within each level, two stages exist to further differentiate development. Once reaching the final level, a moral person can reside at stage 5 – social-contract orientation – or stage 6, universal-ethical-principle orientation. Both stages are characterized by an emphasis on the universality of individual rights and ethical principles. Thus, a moral person would likely seek and weight criteria based on the moral philosophy to which he or she prescribes. An ethical consequentialist – someone who evaluates the ethics of a decision based on the outcomes of that decision rather than the actions employed to produce said outcomes – would include effects of a decision within the list of criteria analyzed. On the other hand, an ethical formalist – someone who determines the ethics of a situation based on the actions taken or means rather than effects or ends – would only identify criteria related to a specific behavior rather than the outcomes of such behavior. Werhane (1999) suggests that moral imagination is needed to generate decision alternatives that recognize and address the norms, relationships, and social roles interfused within the situation. Once alternatives are developed, a moral person may evaluate them based on which best promotes the fair treatment of people (principle of justice), best protects an individual's moral and legal rights (principle of rights), or produces the greatest good for the greatest number of people (has the greatest utility principle of utilitarianism).

### Moral Person and Intention

The personal morality of a leader influences the way in which alternatives are selected at the intention stage of the decision-making process. Theoretically, a person with greater moral awareness would be less likely to use subconscious decision-making biases that lead to unintended, unethical outcomes. Because they prioritize moral values over others (Rest 1986), their selections are less likely to be based on mental schemas responsible for biased decision-making. Mental schemas are often unintended yet still self-serving. However, even individuals with high morality have unconscious biases or use decision-making heuristics, or shortcuts. Specifically, four sources of unconscious influence have been suggested as particularly common, including implicit forms of prejudice, self-serving biases, conflicts of interest, and fundamental attribution errors. The fundamental attribution error is the tendency to overclaim credit when things go right and blame others when things go wrong. Other dangerous biases may include anchoring adjustment, availability heuristic, escalation of commitment, hindsight, correlation and causality bias, overconfidence, framing, satisficing, familiarity (greater willingness to harm strangers), and discounting (minimizing or ignoring decisions that do not have immediate consequences). Recognizing the existence of these biases or heuristics, a moral person can seek to consciously avoid them when identifying and selecting a moral alternative.

Several studies establish a direct causal link between moral identity and ethical leadership, explaining that a strong perception of oneself as moral functions as a self-regulatory mechanism motivating moral action (Aquino et al. 2009;

Mayer et al. 2012). Leaders whose main source of motivation is the desire to reinforce an ethical self-concept, either in their own eyes or through those of others, will demonstrate moral intent.

### Moral Person and Moral Action or Behavior

The issue of moral agency arises at the behavior or implementation stage of the decision-making process, as leaders that are moral persons likely have the capacity to act with reference to right and wrong. In other words, they are likely to have the resources, legitimacy, and knowledge to transform a moral intent into a moral action. To illustrate, two members of an organization witness the CEO alter financial reports to make it appear as if he'd been more effective during his tenure. Both members share similar levels of organizational commitment and recognize the unethical action as harmful to the general welfare of the organization and want to protect the organization by reporting the CEO. While one member is a low-level accountant with limited job security and power within the firm, the other is the Chief Financial Officer, who reports directly to the Board of Directors. In this scenario, both employees share similar levels of moral awareness, moral judgment, and moral intent but, differ in their ability to realize their intent through action. Even if the accountant was able to report the CEO's actions to the Board, he may choose to believe the CEO, with whom he likely have a relationship, over a low-level, expendable employee. Alternatively, the CFO may have stronger moral agency to take moral action in that she has the credibility and access to convince the Board of the CEO's transgression.

## Leaders as Moral Managers and the Influence on the Decision-Making of Others

Being a moral person is essential to being an ethical leader, but this quality alone does not enable a leader to consistently influence the decision-making of others. In addition to demonstrating personal morality, ethical leaders are moral managers. As a corollary to moral person, the concept of moral management captures the components of ethical leadership that relate to a leader's interaction with group members and the organization.

While it is important for leaders to contribute to the design, development, and implementation of formal policies, structures, and systems intended to guide ethical decision-making, these actions alone do not constitute moral management. Trevino and Brown (2004) note that one of the largest myths surrounding business ethics says that ethics can be managed solely through formal ethics codes and programs. While leaders should ensure the existence of standards, training, advice lines, and reporting mechanisms, these elements will only increase the likelihood that observed misconduct will be curtailed or reported (Treviño and Brown 2004). In other words, leaders aiming to affect ethical outcomes must not only create a formal framework that informs, places incentives, and constrains decision-making but also must manage morally by using their power and position to ensure employees are informed, socialized, and empowered to behave in a way that reinforces the said framework. Thus, leaders that can be defined as moral managers role model ethical behavior, communicate consistently about values and ethics, and use reward and control systems to influence ethical behavioral outcomes. Additionally, they are likely to employ participative leadership and decision-making styles.

### Leadership Styles

Leadership style is a variable developed to describe the way leaders interact with their group members when making decisions and attempting to influence the behavioral direction of the group. While many descriptive versions of leader style have been proposed, most of them can be grouped into three distinct categories. The categories are described along three continua; autocratic versus participative, transactional versus transformational, and task versus socio-emotional. Most applicable to the analysis of moral management in decision-making is the autocratic–participative continuum.

### Leader's Decision-Making Style

Moral managers may employ a stakeholder engagement strategy to inform each stage of the decision-making process. In this manner, a leader's decision-making style can moderate the impact of personal morality on ethical outcomes. The literature plots styles in relation to two axes: (1) level of group engagement in decision-making presets (problem identification or awareness, alternative generation, and evaluation or judgment) and (2) level of group involvement in actual alternative selection and implementation. Leaders with autocratic styles demand limited input from group members, while participative styles encompass various levels of participation on both axes. While autocratic styles can be seen as a means of output control, they rely too heavily on one person's ability to recognize the full breadth of moral components in decisions, to weigh criteria and alternatives fairly, and to make selections absent of the influence of bias.

Participative decision-making styles can counteract an individual's own moral limitations. By engaging others, a leader can draw on collective insight and various perspectives to identify important moral components of decisions. Group and/or stakeholder input can limit a leader's personal biases in the weighing of criteria and evaluation of alternatives. Collaboratively selecting an option, in effect, employs several ethics tests. The test of making something public, or disclosure rule, tests whether a decision can withstand public disclosure or scrutiny. The test of ventilation exposes an intention to stakeholders with a diversity of viewpoints to determine how well it takes into consideration different perspectives. Thus, the logical conclusion is that the wider the variety of stakeholders engaged, the more likely ethical missteps can be flagged and better alternatives developed.

### Leader's Influence Approach

There are many models that present typologies of the way in which leaders attempt to influence the behavior and decision-making of their work members. For example, French and Raven (1959) present an often used typology of the five bases of power. Etzioni (1975) argues that organizations and their leaders influence behavior in three fundamental ways which he calls coercive power, remunerative power, and normative power. Another approach is presented by Walton (1985) who suggests that organizations have an array of influence strategies ranging from control to commitment strategies. Finally, leaders can adopt and seek to influence by employing a style that falls on the transactional–transformational leadership spectrum.

Transactional leaders use exchange, rewards, and coercion to direct the behavior of group members. They rely on coercive, reward, and legitimate basis of power. They follow the tenets of a control strategy of human resource management. They use Etzioni's coercive and remunerative forms of control.

Transformational leaders use French and Raven's expert and referent power bases, follow a commitment strategy, and use Etzioni's normative control.

The ways in which leaders influence ethical behavioral outputs can be explored further through the control mechanisms used by organizations (Katz and Kahn 1966). Within control mechanisms, there are four general processes through which leaders can reduce human variability in decision-making: centralization, formalization, output control, and enculturation.

### Centralization

The use of centralization as a behavioral and decision-making control strategy requires that all decisions made by group members are ultimately approved by the group's leader. On the decision-making continuum ranging from autocratic to participative, this is clearly on the autocratic end. While this may ensure that all decisions originating from this work group conform to the organization's ethical standards, it relies heavily on the assumption that the leader is an ethical person who knows and conforms to these standards.

While this strategy may accomplish the goal of conformity to standards, it is a slow process in which the work group will not be able to react to changing demands and respond to crises. Additionally, group members are unlikely to be prepared for ethical leadership if the group's leader moves on.

### Formalization: Developing Reward and Control Systems

Formalization is the development and enforcement of a set of rules, policies, behavioral guidelines, and procedures designed to control the behavior and decision-making of organizational members. Systems designed to control the way work outcomes are performed are called process controls. Outcome controls are an alternative type of control systems designed to control work outcomes directly. These systems use outcome measures such as goals, quotas, and objectives. An important role of top leadership is to develop these systems in a way that is clear, is relevant, is easy to understand, and is not in conflict with other important organizational objectives and performance requirements.

Another important element of a process control system is the means used to enforce behavioral standards. These are generally either rewards of sanctions for compliance or noncompliance to the standards. The standards can be established as a set of stand-alone codes, as in a published code of ethics, as part of a disciplinary system, or integrated into the performance appraisal system of an organization. Likewise, the rewards and sanctions can be applied directly to compliance or noncompliance or tied to the performance appraisal process, as in merit pay systems. While rewards can be used as part of the control structures, sanctions usually depend on coercive power to enforce rules, that is, formal negative sanctions and punishment for rule violations. When sanctions are publicized, there is possibility of vicarious reinforcement in the form of social learning, when organizational members learn about the consequences of certain important violations.

Process control systems become a central component of an organization's structure. Some organizations have formal structures, called mechanistic structures, while others have rather loose structures with fewer process or behavioral control, or organic structures. In the ethical decision-making literature, there has been a lot written about establishing and applying consequences to violations of ethical standards (James 2000). In some cases these have been proven to be very effective in reducing ethical misconduct and breaches. Code of conduct, code of ethics, whistle-blowing policies and support, transparency measures, hotlines, trainings, formal sanctions, and communication policies are just some of the approaches used by organizations (Lindsay et al. 1996).

While formalization as an approach can be effective if correctly applied, leaders have reported some problems with this approach. Organizations find that they cannot establish rules for every contingency, and some decisions are so embroiled in uncertainty and the need to act quickly that they have to give decision-making more autonomy and fewer constraints. When decision-makers are given more autonomy, organizations have to rely on individual group members' ethical decision-making ability. Leaders find that they cannot monitor all behaviors and decisions made by their work group members leaving open the likelihood that many violations go unchecked. Another issue facing leaders performing in mechanistic structures is that they cannot develop rewards and sanctions for all rules. Some of these issues can be taken care of through increasing the internalization by work group members of important ethical standards, the development of a system of social sanctions to replace leader monitoring and formal sanction, and the use of systems of output control. These are discussed in the next sections.

### Output Control: Infusing Ethical Standards into Goals

When organizations operate in dynamic environments, it is difficult to respond to the changing needs and demands of their stakeholders with mechanistic structures, characterized by a myriad of complex rules and procedures. To be more effective at adapting to these changes, firms adopt more organic organizational structures, characterized by flatter structures and fewer set procedures. Leaders must develop ways to control work group member behavior without relying on process or behavioral control methods. They turn to output of outcome-based methods. Control is achieved through processes such as goal setting, developing quotas, and maybe performance evaluation metrics.

Outcome control procedures hold group members accountable for the results of their work and not the means used to achieve them. Total outcome measures, say to workers, get results by any means possible. When decision-makers are free to achieve results by whatever means available, they can react more quickly to changing stakeholder demands, but it leaves organizations wide open to ethical breaches. Other issues with a goal-based approach are that all work performance cannot be assessed in terms of outcomes, some outcomes cannot be accurately measured, and the achievement of many goals cannot be attributed to a single individual.

There are a couple of ways to deal with this ethical dilemma. The first is to move from a total goal focus to a goal focus with constraints. In fact, this is what most organizations do as few organizations give employees total autonomy without consideration of laws or other standards. The task facing leaders is which ethical standards to enforce within the goal-based system. The second solution is to couple a goal-based approach with an approach that works to internalize ethical standards into the decision-making and motivational processes of work group members. These enculturation methods are discussed in the next section.

## Enculturation and Role Modeling

One of the most effective ways to increase the likelihood of the use of ethical standards in organizational decision-making is by developing a strong organizational culture or, more specifically, a strong ethical culture (Mayer 2014). A strong culture is defined as having a defined direction, or course, which drives the organization, pervasiveness, or how widely the cultural elements are shared among members, and strength, or the degree of influence the culture has on organizational members (Kilmann et al. 1986). Cultural control mechanisms include social norms, shared values, shared mental models, consensual schema, and social identities. Ethical cultures use all of these mechanisms at various times and to different degrees. There are a number of things leaders can do to establish strong ethical cultures. These include role modeling, communication, reinforcing the social identity of group members, enacting more participative leadership styles, and developing more transparent decision-making processes.

### Role-Modeling Ethical Behavior

One of the most significant pathways through which to influence member behavior is through role modeling – or the demonstration of certain behaviors with the aim of emulation. Social learning theory (Bandura 1986) posits the ability to learn appropriate behaviors through observing the behavior of others. "Group members exposed to similar cues in an environment regarding norms for appropriate behavior tend to behave in a fairly homogeneous manner" (Mayer et al. 2012, p. 152). Thus, it is important to dissect the ways in which a leader's behavior can influence group members at each stage of the decision-making process.

A leader that consistently recognizes and integrates moral issues into decision-making demonstrates a level of moral awareness that group members can emulate or seek to develop. Theoretically, group members that consistently witness leaders addressing ethical issues will develop greater moral awareness, enhancing their ability to recognize the moral components of issues at the initial stages of the decision-making process.

Determining and communicating is considered a single process considers ethical is one of the most significant challenges to creating an ethical organization. Yet, group members need this criteria to develop ethical alternatives. Through their own actions and decisions, moral managers demonstrate what the leadership views as ethical, clarifying any ambiguity employees may have or sense.

Beyond basic clarification, role modeling also sets expectations for group member behavior. For instance, leaders with high moral identity internalization define success by the way results were achieved, as well as what was achieved (Mayer et al. 2012). Group members observing this behavior will likely prioritize alternatives that align with this philosophy in the judgment and intention stages of the decision-making process.

Finally, a leader can demonstrate how to translate moral intent into moral action. A leader

generally operates within the same organizational systems and structures as group members. Thus, group members can learn how to implement a moral decision within these confines or through these systems. For instance, one leader may address employee misconduct in small group meetings, while another may arrange one-to-one discussions, thus highlighting the most appropriate forum for raising issues regarding ethical misconduct among employees.

The extent to which role-modeling ethical behavior will influence the decision-making of group members depends upon two factors. First, a moral manager must demonstrate cross-situational behavioral consistency to ensure that any particular decision is not viewed as idiosyncratic; rather that it is based on a world view that reflects a set of ethical principles. Second, group members are more likely to emulate and internalize leader behavior when a leader's power stems from innate characteristics such as expertise, legitimacy, and identification, rather than actions as with coercion and reward.

### Reinforcing Social Identity

The social identity of individuals is a very important component of their self-concepts which drives a large portion of their decisions (Ashford and Mael 1989). Social identities can be centered on sources such as professions, social groups, location of origin, or work organizations. One driver of social identity is a closeness of values between the source entity and the individual. Individuals take on the social identity of their work organization when, among other variables, the organization's espoused social values and the individual's social values are aligned. When employees make decisions and behave in ways consistent with these values, leaders can recognize the importance of these actions and validate these values as part of the individual's self-concept.

### Participative Decision-Making

When leaders move along the continuum from autocratic toward participative, they open up a number of human resource development strategies for increasing their organizations' capacity for ethical decision-making.

Group decisions are decision process in which leaders meet with their work groups to make a decision or to solve a problem. These process can range from a process in which leaders present the problem, decision criteria, and alternatives they are considering and ask for consultation, through processes where leaders present the problem and engage the groups to develop criteria and alternative solutions, but leaders make the final choice, all the way to full group participation with the groups empowered to complete all steps of the problem-solving process and the leader taking on a process facilitator role.

Leaders can be instrumental in establishing decision-making or problem-solving constructs, prototypes, or models that ensure important stakeholders are considered in establishing criteria, ensure criteria set also includes the company's ethical standards, develop search processes that are likely to discover or create innovative solution alternatives, and ensure alternatives are evaluated by the criteria set established by the group. Effective leaders also use group decisions to teaching group members skills like stakeholder interest analysis, means–ends analysis, moral awareness, and moral imagination.

## The Leadership, Ethics, and Decision-Making Nexus in Practice

The constellation of moving parts that result in leaders embodying and promoting ethics in their organization is complex. For this reason, many organizations have implemented ethics programs to provide the guidance and oversight needed for ethical behavioral outputs. Those leading these initiatives, generally termed ethics officers, are the formal manifestations of ethical leadership. Ethics officers have the arduous task of setting the organizational standards for moral personhood and moral management. At the same time, they are often responsible for ensuring the appropriate situational or organizational factors are in place to guide organizational members in their ethical decision-making. These factors include written standards of conduct, mechanisms to seek ethics guidance, integration of ethical conduct into

performance evaluations and incentive systems, and proper channels for reporting misconduct or whistle-blowing.

As discussed above, individual factors, such as values and consistency of individual values with organizationally espoused values, moderate the role of ethics in an employee's decision-making. Thus, ethics programs would not be complete without training programs aimed at cultivating greater moral awareness, moral intensity, moral judgment, and moral behavior in the individual. The placement of ethics officers in organizational hierarchy and the ability to "manage ethics upward" are two important determinants of the effectiveness of ethics officers.

As part of its ethics program, Texas Instruments has created a wallet-size "Ethics Quick Test" card for employees to carry. The test includes the following questions:

1. Is the action legal?
2. Does it comply with our values?
3. If you do it, will you feel bad?
4. How will it look in the newspaper?
5. If you know it's wrong, don't do it.
6. If you're not sure, ask.
7. Keep asking until you get an answer.

*Texas Instruments*, "*Ethics Quick Test*" (*Texas Instruments Ethics Office*), *wallet card*. (Source: Carroll and Buchholtz 2014, p. 347)

## Conclusions

Leaders shape organizations through the decisions they make. Therefore, an organization aiming to be ethical will need ethical leaders who make ethical decisions. Furthermore, leaders influence the way others make decisions. A moral person is a precondition to develop a moral manager. Moral managers influence organizational members to behave in ethical ways to bring forth ethical organizational outcomes. Ethical outcomes have been found to enhance organizational performance.

Ethical decision-making models posit that ethical leaders need to both demonstrate and promote ethical decision-making through increasing awareness, role-modeling ethical judgment, and integrating values that demonstrate intention. Ethical behavior as both process and outcome also needs to be validated to influence ethical behavior in employees.

As moral managers, organizational leaders influence the decision-making of others through informing, incentivizing, and empowering others to follow formal policies. The accomplishment of these leadership tasks is affected by leadership styles and decision-making styles and by leaders' influence approach. They are also modified by the specific control mechanisms used by organizations such as the degree of centralization and formalization of reward and control systems.

One of the most effective ways to elicit ethical behavior is enculturation through role modeling of ethical behavior. Especially relevant is leaders' ability to role model the translation of intent into action. Ethical leadership is most effective when leaders are consistent across situations in modeling ethical decision-making and when their leadership behavior stems from "moral person" traits. A key element of enculturation is to reinforce employees' social identities through noting the compatibility of employees' personal values and organizational values. Participative leadership also is the most effective leadership style in influencing ethical behavior in decision-making.

Many organizations implement formal ethics programs and structures to provide the guidance, oversight, and accountability for promoting ethical behavior. These help organizations set ethical standards and put in place the appropriate structure (organizational and situational factors) that enable organization members to follow the organization's ethical standards. Thus, both ethics programs and accountability structures are necessary conditions to promote leadership in ethical decision-making.

# Leading Climate Change at the Local Government Level

Haris Alibašić
Public Administration Program, College of Education and Professional Studies, University of West Florida, Pensacola, FL, USA

## Synonyms

Climate change; Climate resilience; Preparedness; Sustainability

## Definition

The climate change actions at the local government level have increased in recent years with the progressive rise in threats from extreme weather events and the lack of action by the

national governments around the globe. The activities undertaken by local governments to counter the irreversible effects of climate change include climate action planning, climate mitigation, climate adaptation, climate preparedness, and resilience planning.

## Introduction

Cities are leading the global efforts and taking a proactive role in addressing the threats of climate change. Most of the climate change activities are undertaken in response to the threats from extreme weather events causing significant damage and disruptions to the service delivery, the infrastructure, and the resources. Notable climate change threats include intense rain events, floods, sea level rise, droughts, and heat waves, with the immediate impact to the urban areas. A spectrum of environmental, economic, and social issues and predicaments in communities expose the external and internal vulnerabilities faced by the local governments, further exacerbated by the climate change and extreme weather.

Climate leadership at local levels of government is well documented (C40 Cities 2017; Ryan 2015). Most of the climate actions are aimed at reducing the GHG emissions, mitigating the impact of climate change, or adapting to new climate realities. In the United States, cities from Fort Collins, CO, to cities of Satellite Beach, Sarasota, Pensacola, and Broward and Miami-Dade counties in Florida, and Portland, OR, Chicago, IL, New York, NY, Los Angeles and San Francisco, CA to Grand Rapids and Ann Arbor in Michigan are preparing for and working toward incorporating a long-term climate resilience planning into the decision-making process. In Pensacola, the city council named the Climate Mitigation and Adaptation Task Force to make the climate action recommendations for the city and the region (Baucum 2017).

As an example of an active leadership at the community level, authors of the Grand Rapids Climate Resiliency Report reviewed the climate change trends, with the long-term regional assessments, making policy recommendations for policy- and decision-makers in the city and the region (WMEAC 2013). WMEAC (2013) defined the climate resiliency as "the ability of a community to simultaneously balance ecological, economic, and social systems to maintain or increase the quality of life in an uncertain, dynamic climate future" (p.viii). The application of the cities' climate action plans and strategies is part of the ongoing efforts and insights into the complexity of climate change and the corresponding economic, environmental, governance, and social conditions of the community.

In defiance to the US administration's decision to withdraw from the world climate treaties, and in showing leadership, 391 US mayors signed the commitments on behalf of their cities to reduce GHG emissions in-line with the Paris climate accord requirements (Climate Mayors 2017). Moreover, over 250 mayors committed to the 100% renewable energy targets (USCM 2017). These efforts by city governments to mitigate the air pollutants in communities and to promote climate resilience and preparedness are necessary to prepare for the next weather-induced, record-breaking natural disaster occurring frequently. Elected and appointed officials in cities are expected to prepare for the future extreme weather events and climate change-related impacts.

## The Realities of Climate Change

A significant body of research provides for undisputable evidence of human-caused disruptions to the earth climate systems, leading to potentially devastating consequences for life on earth. The threats of climate change include the increasing global temperature, the sea level rise, and extreme weather patterns across the globe, with the severe effects on economic aspects of life from agriculture and forestry to fisheries, biodiversity, energy and water use, transportation and logistics, species diversity and ocean management (Fletcher 2013; IPCC 2014; Karl et al. 2009; Mach et al. 2016; Malcolm et al. 2006; Mayhew 2001; Pecl et al. 2017; Segan et al. 2015; Stott et al. 2016; Urban 2015; Visser et al. 2014).

## Scientific Consensus and Climate Change Denial

Despite scientific consensus on the root causes of the changing climate, a defiant minority with significant financial backing from traditional energy industries are efficiently interrupting the effort to counter the effects of climate change. The slow nature of the global community action to address the threats of climate change is coupled with the outright hostility of the current United States and some state administrations to the issue of climate change. In addition to the US administration's decision to withdraw from the multinational climate accord signed in Paris by all but two countries in the world, some state hostilities toward climate science are exemplified by the directives from the governor's office to the state staff disallowing them to use the phrases related to climate change. In Florida, for example, Korten (2015) reported how the state officials were banned from using the climate change in official state documents and communication. While the brunt of the climate change impact will be localized to communities and cities impacted by the extreme events, the new political realities in the United States will dictate cities to rely on their resources, with significant cost burden carried by the local governments.

## Cities and Vulnerabilities to Climate Change

Researchers have effectively demonstrated the cities' vulnerabilities to climate change. The pressing needs and demands to address the threats to the health of the environment with an increase in greenhouse gas emissions and symptoms related to increased pollution and the cost of traditional energy sources are well documented (Burch 2010; Hallegatte et al. 2011). Hallegatte et al. (2011) posited the cities to be most vulnerable to climate change and the implementation of climate action strategies to be the most effective on a local scale. Moreover, Fitzgerald et al. (2012) suggested: "emissions of greenhouse gases leading to climate change, represent the most important current environmental challenge" (p. 371). Furthermore, Silva et al. (2013) linked the increase in mortality rates to industrial and other pollution from fossil fuels from human activities and further linked it to the impact of the climate change. Finally, beyond addressing environmental concerns, Fitzgerald (2010) noted the connection between cities' strategies to climate change and job creation and economic development.

Residents in cities living in poverty are more vulnerable to natural disasters and the effects of climate change, and environmental shocks are threatening their livelihoods and undermining food and job security. Thus, improving the environmental management of the local natural resources can inadvertently increase the resilience of vulnerable residents to environmental risks and improve their livelihoods. Poverty and the local environmental risks are linked to multiple factors including livelihood, health, resilience to environmental threats, and the economic development. Poverty levels and the environmental health are linked in dynamically specific approaches through a geographic location, scale, and the economic, social, and cultural characteristics of the individuals and households within cities. By addressing climate issues, communities ensure a sustainable path to poverty reduction and human development. With the degradation of the environment, poverty is expected to increase as the healthy environment and natural resources contribute to the economic growth and level of employment through various industry sectors. As climate change increase so do the risks to various industries, including agricultural, forestry, fishing, manufacturing, and transportation among many other sectors and industries.

## Climate Mitigation, Adaptation, Preparedness, and Resilience

The efforts to address threats of climate change in cities are multilayered and vary from region to region. However, most of the differences are

based on the type of government, the available budget, community demands, number of employees, pressures, and threats from extreme weather. The commonalities among various approaches by cities in addressing climate change are reflected through greenhouse gas emission reduction, climate change mitigation, adaptation, preparedness, climate resilience, energy efficiency and conservation, energy management, community resiliency, and renewable energy use and production. As observed by Alibašić (2014), climate science is instrumental to cities' planning for mitigation of the effects and adaptation to the impacts of climate change (p. 27).

Climate mitigation strategies include efforts to reduce reliance on traditional sources of energy, including waste-to-energy and renewable energy production, reduction of waste and the use of nonrenewable resources, and repurpose and reuse of the resources, leading to decreases of pollutants into the atmosphere. Climate adaptation efforts require local governments to prepare for and execute policies and programs, with a process and design change in mind for cities to adapt to inevitable changes occurring in the environment. Both the climate mitigation and climate adaptation strategies indicate the requirements for various approaches and policies cities need to undertake to mitigate and adapt to the impact of climate change.

The community-wide preparedness and resilience take into consideration emergency preparedness, sustainable energy planning, climate change data, historical weather patterns, and health and safety issues and incorporates them into the city-wide long-term sustainability and strategic plans. Such communities realize the need for energy reduction, transfer of power production and consumption to renewable energy sources, easy access to public transit infrastructure, uninterrupted water delivery, access to local and organic foods, and reduction of waste by the reuse of resources in order to withstand stresses and recover from shocks with essential functions intact. All of these efforts must be measured, tracked, and progressively reported to provide for transparency, good governance, and accountability and to promote resiliency within the city (Alibašić 2017).

## Conclusion

Chief features of climate change actions at the local governments' level are the cities' ability to prepare their respective communities to be more agile and adaptive to extreme weather events and disasters. Cities' resilience efforts are flexible, with a firm leadership commitment and steady comprehension of the new realities on the ground. The comprehensive nature of climate action efforts in cities is the use of a dynamic approach to resiliency planning, continually adapting to changing economic, environmental, and social conditions as a result of new realities. Local governments' climate preparedness is exemplified through a constant review and revisions of the existing plans, layering and preparing to adapt and mitigate new occurrences.

The local climate action leadership is exemplified through the ability to plan for and concentrate efforts toward protecting all residents, particularly those living in poverty or vulnerable situations, by ensuring environmental stability and protecting the economy from the harmful effects of disasters.The critical component of the climate mitigation, adaptation, preparedness, readiness, and resilience planning in cities is the ability of elected and appointed officials and administrators to integrate the relevant climate science data into the short-term and long-term plans and strategies, and to connect them directly to the budgetary and fiscal plans. Climate-resilient cities are better equipped to respond to shocks and events caused by the global climatic changes.

# Leading Governmental Reform

David Arellano-Gault
Centro de Investigación y Docencia Económicas, Mexico City, Mexico

## Synonyms

Managing administrative reforms; Strategy of governmental reform

## Introduction

Governmental reform is usually seen as a rational process of change and improved governance. In practice, however, reforms are extremely intricate, costly, and risky processes. Rarely do they achieve all their objectives, while reformers' proposals are full of promises and rhetoric. In many respects, reforms are political projects wrapped in arguments and administrative techniques that create high social expectations of improvement of the governments that propose them. Reforms are usually legitimized through concepts such as progress, development, efficiency, savings, modernization, or transformation. And they regularly affect or attempt to affect the behavior of tens of organizations and thousands of people, both inside and outside government itself. Their complexity is such that they usually require a long time to be legitimized and implemented and more still for their impact to be evaluated – which usually extends beyond the term of a particular administration. The extent to which a proposed reform achieves all its objectives and does so in the way that was intended is ultimately a vague question and, some would suggest, immaterial in the long run (Brunsson and Olsen 2007). What is important is to demonstrate will, raise hopes, and achieve certain changes that may, in any case, serve as the basis for a further-reaching transformation. What is clear is that contemporary governments can hardly be legitimized if they do not propose major changes and reforms.

## The Challenge of Leading Governmental Reforms

Etymologically, the term "reform" comes from the Latin. It is composed of the root *formae* meaning "image" or "form" and the prefix *re-*, which is a reiteration. Inherent in the term, then, is the idea of putting back into shape or conditioning so that something, whatever it may be, functions according to an original, prefigured objective.

In this respect, a reform is an act of conditioning, but by adding the adjective *governmental*, the idea of conditioning acquires an importance that includes any change planned *ex profeso* that affects or involves not only the government in question but possibly its relations with the legislative and judicial branches, various laws and mandates, and, of course, the behavior of hundreds of people in the various organizations involved (both public and private). Reforms are therefore multidimensional, and the ability to adopt them calls not only for political and managerial skills but also for leadership and innovation. From this perspective, it is conceivable that a governmental reform involves not only ideas and projects but also efforts to affect dozens of different, heterogeneous organizations, comprising the political and administrative system of a country or region (Bobbio et al. 1998). It should therefore be stressed that the design of a reform is just the beginning of a long process that will require the *guidance* and *leadership* of certain people, for a long time and with enormous costs, restrictions, contingencies, and uncertainties to face. In other words, the process of implementation is often such a challenge that it defies the aspirations and assumptions through which the reformers themselves legitimized their proposals. Reformers generally wish to recover or build frameworks of formal power and rationality in the action of multiple actors and organizations, yet they must achieve this in a real world of multiple rationalities and different, disparate agendas (Peters and Pierre Withford 2012), usually in conjunction with extraordinary pressure of time. Thus, implementing a governmental reform involves bringing about significant changes in the behavior of many people in the quest for new and renewed effects of the action of the government apparatus. These effects and behaviors are expected to come close to fulfilling an aspiration for change and improvement within a highly dynamic political and organizational environment. From a managerial perspective, administering and directing a reform involve a capacity for leadership over very different structures and processes of various formally established authorities and organizations as well as their administrative apparatuses and policies and processes. This all takes place within a logic of great uncertainty, constant contingencies, and increasing restrictions as the end of the

administration that proposed the reform approaches.

Leading a governmental reform is only partly a matter of great ideas that appeal through their promises. It is more than worrying about a public policy design vision. It is, above all, a political and managerial act of creating new opportunities through the breaking of inertia and balances within a framework of restrictions and multiple interests – rather like what Moore (1995) defines as public value in a more specific management context. It is a form of leadership that can aspire to little control and acts in a context of high uncertainty, which, however, seeks to achieve the results expected by the rhetorical promises of the reform itself.

Directing governmental reforms requires political and managerial capacities in concert. A reform may be a rhetorical proposal for change, but it is also a proposal with a far-reaching political impact, in response to various triggers. A classic example is stimuli that are external or exogenous to government such as international crises that are usually accompanied by solutions proposed by multilateral agencies. Another trigger process may be a need for legitimacy due to a gap or a real or imagined distance from a better past (Lasswell 1951). In this respect, reforms can be seen as projects regarded as indispensable, although based on very different values and expectations that are usually very high and even impractical though no less necessary according to the various social actors demanding them. The third trigger occurs when there is a large asymmetry between what actually happens and what should formally happen with implications regarding effectiveness and efficiency in the performance of organizational actions. When it is clear that government and administrative objectives are not being achieved, it is tempting to consider modifying the rules, structures, processes, and recruitment mechanisms or even changing/adapting the objectives themselves in order to be able to condition elements that will help reduce situations of inefficiency, ineffectiveness, poor quality, or responsiveness in dealing with public functions and problems (Kelman 2005; Pollitt and Bouckaert 2011).

Leadership of a reform, then, appears to be critical since it is a process involving the management and administration of high expectations and the mobilization of multiple organizations, regulatory frameworks, and political actors in spaces of growing contingency and restriction. It is therefore not surprising that reforms are increasingly legitimized by using simplifying force ideas and simple, direct rhetorical proposals. Nor is it surprising that given the complexity of a reform project, it is often necessary to admit and promise that it is possible to use tools and models that assume that reform is a rational, coherent, manageable process that can be directed. Managing these expectations in order to convince many social and political actors is an essential part of the leadership of a reform. Once the reform is perceived as socially desirable and feasible, it is time to integrate the various elements and proposals involved in a logic capable of linking them into an application that is as congruous as possible. This process should keep in mind the important balance between what it is hoped will be achieved and what the restrictions and political conflicts involved will actually make it possible to achieve. It is not uncommon for the design of reforms to include a hard core of nonnegotiable, pressing changes (e.g., budget cuts, decentralization, introduction of competition mechanisms, expansion of participants/managers actors) and a second area of more plastic components that make it possible to submit the proposal to different actors who can be discursively persuaded about how to operationalize and which route to take to solve previously identified real (or imagined) problems (Pollitt and Bouckaert 2011). Leading a reform involves the ability to construct these two areas of reform and walk down the winding path of their negotiation.

However, the way forces begin to operate in reform involves considering – and knowing how to act strategically in consequence – a wide range of factors that can be grouped into three dimensions: *political and organizational implications*, *contextual implications* that emerge when the reform is presented and promoted, and the *implications of implementation*, *prior to and within the process of the reform itself*. The management and

prior strategic treatment of these dimensions can turn them into either obstacles or catalysts that facilitate the promotion and desired management of reform. The timing of how every possible situation is dealt with and foreseen according to a vision of reform is therefore relevant as regards the results of change/conditioning achieved.

Inducing an attitude of change is no simple matter, particularly if it involves government, although some opposition forces may be reduced if the *triggers* that motivate reform have produced acute effects and problems with a high impact and visibility. In these cases, the use of "shock and awe" can be a catalyst that agglomerates forces for reform or simply something that expresses the need to create changes (Kelman 2005), although the strategic management of timing between the various dimensions is a crucial factor.

As for *political and organizational implications*, the leadership process usually takes various elements into account:

1. The sphere of the jurisdiction in which the reform will be promoted, in other words, if it is national, subnational, or sectoral. This indicates the type of political and organizational stakeholders that could emerge *per se* and the struggle that would take place between the different types of discourse, whether it will be a highly technical discussion or rather one that mobilizes/agglomerates the forces and social causes used to promote or prevent a change – whether of the type that "activate the discontent" or are "change feeding on itself" (Kelman 2005).
2. Determining the jurisdiction also helps identify the lobbying that needs to be carried out – inter- or intraorganizational – and the kind of transactions/commitments that could occur between political forces.
3. The characteristics of the political system and the rules established for driving change also determine the extent and real possibilities of the supports and coalitions that must be established and the spheres of power (judicial, legislative, and executive) that must be connected in order to bring about change. In this respect, it matters whether the person who proposes the change is an actor who is part of the government or the opposition and whether it is feasible to find points of agreement to solve the problem that the change is intended to solve.
4. *Path dependence* provides strong clues about how a proposed change could be received or limited on the basis of past decisions. In this respect, it is an element that can help predict how to design the lobbying strategy and construct the hard core of the reform so that it is consistent and can be embedded into the prevailing system of values and institutions.
5. The organizational sphere is therefore critical: organizations are the real homes of change, where the concepts, processes, and resources of reform in its many projects and constituent parts are created and defined. And, of course, they are the scenario where changes to the legal framework, the structure, and processes of concrete action that will bring the reform to life will eventually be implemented. It is a well-known fact that since organizations are spaces of stability and change, routines, standard processes of action, rules, and labor specialization will largely determine the real effects of a reform. Leading change in spaces of stability such as organizations is probably one of the most serious leadership challenges to be faced in the adoption of a reform. Let us not forget, moreover, that we are talking about directing a reform that affects a number of organizations with their own internal logic and context. The various organizational forces, such as hierarchy, which are essential to limiting the faculties and fields of discretionality of many actors, are also a kind of obstacle since they create spheres of resistance to change because of the uncertainty they create. Organizations, as apparatuses designed to ensure stable, standardized action, are formally intended to achieve compliance with specific goals – that is the principle of bureaucracy. They are highly resistant – often with good reason – to the change and innovation proposed by reform. Innovations can be rhetorically appealing, but highly risky in action, or in the internal calculation of the dynamics of power and organizational

coalitions (Cyert and March 1992), which is why the general proposals of the reform encounter local obstacles or ones that are specific to each organization. In practice, a reform may involve the ability to lead change in dozens of organizations, each with its own internal logic and particular context. Organizational change involves modifying the functioning of the intraorganizational system, reconfiguring its rules and spheres of power between units, while confronting the vision/criteria of the actors implementing the reform and those promoting it from the top of the government structure.

6. Likewise, the composition of the spheres of power between units within an organization is an element that will be capable of rejecting or boycotting the overall change proposed. This is especially true since change entails a cost for public servants in their different areas: costs that can range from learning or acquiring new skills and knowledge to undertaking new routines. Moreover, there is a tension between change, which is innovative per se, and the framework, particularly an informal one, of an organization since it potentially threatens the structures, culture, values, incentives, identification, and power relations that have developed over time (Kelman 2005). In this respect, established power relationships and existing groups prevent each member from being critical and even limit their ability to decide. Leading a reform usually means ensuring that the managerial and political allies in the various organizations can transmit and translate reforms into these more specific logics (Halligan in Peters and Pierre 2012).
7. The depth of the change to be achieved is the last major element of political and organizational implications, since there is a positive correlation between the depth of the proposed reform type and the expected level of risk. This situation can limit the progress of the reform by agglomerating several actors against it due to the scope of the endeavor.

These factors, which leading a reform takes into account, clearly describe the need for a strategic approach to managing governmental reforms. Promoting a change of this nature not only involves following the formal procedures stipulated by the regulatory framework or assuming that the ideas for a reform support themselves or are based on their rational or political appeal. The alignment and constant negotiation with the political and organizational field of reform require a perspective, a constant direction that makes it possible to circumvent the various contingencies so that the effects of the reform resemble the promises made when it was conceived and designed.

From a strategic perspective, then, the leadership of a reform takes into account the multiple conceptual forces and interactions between organizations and people, which will resist the proposed change. It would appear that the only thing the reformer can be certain about is the fact that reality will resist. Leading a reform process involves knowing in advance that the proposed reform will undergo modifications during its discussion, which will subsequently be altered during the process of implementation (Wildavsky and Pressman 1973). As regards these implications, the following factors should be considered:

1. The identification of actors who support or oppose change is crucial. This will make it possible to distinguish between what is desirable and actually feasible through the reform on the one hand and, on the other, to generate agreements that reconcile the path and the instruments for achieving what is expected within a framework of the possible.
2. The breadth and capacity for action, resonance, and power of the actors who can take part, in this regard, the mass media, citizens, and the business sector, as well as the diversity within the ranks of each, can help shape or hinder the reform's agenda of change. The proposed change may have watchdogs, for and against, and modify relations between the two very quickly.
3. The number of *triggers* and the extent of their effects can galvanize the acceptance or rejection of the reform. This factor can potentially

promote change and create common spaces that anchor the discussion and public debate, "without problems, reforms are difficult to justify" (Brunsson 2009).

4. Accidents and contingent events – national or international – that occur during the process of debating the reform can serve as catalysts that encourage or completely derail the proposal. In this respect, this type of contingencies may be a "window of opportunity" (Kingdon 2010) for making improvements or identifying potential corrections to the proposal.
5. The construction of the discourse and the message that will be conveyed to different audiences and actors is a fundamental step in a governmental reform. Marketing a reform calls for the ability to adapt clearly and simply according to each interlocutor while maintaining consistency as regards the hard core of the desired objectives and operational and administrative ways of achieving them (Brunsson 2009). It is important that the message be transmitted in full, although the use of ambiguity may help avoid committing to difficult-to-achieve goals (Moore 1995) and dodge the militant actions of sectors and groups that could stand to lose as a result of the change. The consistency of the message and its coherence – realistic expectations – with social, political, and economic values is important, since it determines whether the proposal will be accepted (Pollitt and Bouckaert 2011).
6. It is also, to some extent, useful for the objectives or proposals of the reform to be proposed broadly or even ambiguously, since given the complexity of the implications and factors, it is difficult to ensure the planned, controlled implementation of the expected changes. In this respect, leading a reform involves a virtuous combination of specific skills and capacities: being able to handle the uncertainty and ambiguity in favor of the reform and thus, paradoxically, being capable of ensuring that the effects of the reform, after the resistance, contingencies, and counter reforms, achieve some of the expected effects clearly and precisely.

## Conclusion

Governmental reforms tend to be in many respects abstract, simplistic, and rhetorical, at least in their basic or general proposal designed to convince the broadest public. But even the simplest reform, as discussed above, affects dozens of organizations and hundreds of people. The process of implementing a reform is therefore obviously not a program with a linear action: "[R]eformers typically treat implementation as their main problem" (Brunsson 2009: 9). The challenge is not only to agglomerate the forces in favor of change and keep its hard core intact but also to create beliefs and even hopes that will facilitate the processing and acceptance of changes both by bureaucrats and by other political actors – so that the implementation marches toward a combination of the desirable and the feasible. The challenge of implementation shows how reformers actually have very limited power in the process of conducting and implementing reform – their greatest influence may lie in triggering the need for and the idea of change (Brunsson 2009). Many processes of leading governmental reforms quickly understand that from the moment a reform is proposed, it opens up a set of multiple arenas and stakeholders. These sets and arenas turn the reform from an abstract project into a dynamic of real interaction in constant motion. That is why, in practice, reforms often obtain results with less breadth and depth than expected, which is to some extent *normal*. A governmental reform fires quickly at a constantly moving dynamic, and its leadership must be no less agile.

If governmental reforms are projects that generate constantly moving political and managerial dynamics, the strategy and tactics of implementation therefore end up being critical. Given a shifting reality of this nature and the contingencies and accidents that inevitably happen along the way, the strategic priorities for leading a reform can be summarized in three indispensable minimal points: the reform must offer *substantive value*; it must obtain and maintain *constant or minimum legitimate and political sustainability over time*; and the offers and costs involved in the reform must be maintained and sustained

within a *relatively stable operational and administrative feasibility* – adapting Moore's ideas (1995) on management action. These three strategic elements are those that can potentially strike a fair balance between the desirable/aspirational and the pragmatically feasible. Insofar as the value offered by the reform is important for various sectors of society, the process of change proposed by the reform will be able to be sustained as a result of the support of various stakeholders who agree to assume the costs involved.

Political and legitimate sustainability is a requirement that is achieved insofar as the political system legally and administratively permits change for a reasonably long period. Different interests, which are highly volatile, must be aligned in a certain way, so that the degree of support for the reform, which usually declines over time, is constant and sufficient to promote the essential changes. Lastly, administrative and operational feasibility means taking the organizational dynamics involved seriously: a dynamic of multiple, heterogeneous organizations that will be responsible for translating changes into reality and action and generating the expected outcomes, which are the true manifestation of the effects of the reform. These three minimum elements of Moore's strategic triangle (1995) give a clear idea of the challenges of leading a relatively coherent, consistent, socially useful reform process within an environment of uncertainty and contingency any governmental reform invariably faces.

# Leading Groups

Amine Nasr
School of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Group leadership; Motivational Leadership; Effective Leadership; Transformational Leadership; Transactional Leadership

Leaders are often correlated with the likes of JKF, Alexander the Great, Martin Luther King Jr, or Julius Caesar, all of whom displayed spectacular levels of character and charm. However, their place in history was not simply due to their own natural talents, but more so in the alignment of their talents to the needs of the people and circumstances around them.

Leadership at the core is the ability to guide or inspire a group toward achieving a particular objective (Robbins and Judge 2015). The diversity in human nature, coupled with the endless array of circumstance surrounding it, makes

finding a universal solution in successful leadership quite difficult. To lead a group requires a dynamic individual with certain qualities that leverage the situational elements, even more so for individuals who are new to a leadership role that lack past experiences of which to reference. The ability to accurately read and respond to the circumstances at hand is required in effective management. As a basic example, unruly group members, or those requiring discipline, may conform when assertive behavior is applied from the leader. Alternatively, assertion can be highly adverse if the members are competent and experienced. Therefore, a good leader must be able to assess and adjust to individual behaviors or needs.

Effective communication is a key attribute. The quality, and frequency of communication, is in many ways the platform on how relationships develop between the leader and the members. Effective communication is undoubtedly a two-way process and must be promoted as such for various critical functions of relationship development. Trust, for example, is difficult to obtain if members cannot identify some level of interest or empathy from their leader toward their needs (Schoorman et al. 2007). This fuels the perception that the leader is either uncaring, or that the group is not worth caring for. Member confidence will suffer and a sense of individual expendability will perpetuate. Such a group norm would undoubtedly have cascading adverse effects on overall performance. In short, with poor communication, group alignment will be extremely difficult to achieve, and with poor alignment follows poor performance.

Leaders who communicate well are also less likely to foster a group environment which breeds expectations based on assumption. Inefficiencies in overall group performance can in way or another be traced to assumptions. A leader who assumes that group members understand how he or she feels about certain behaviors, or what certain task expectations are without having been explicitly expressed, can generally yield greater rates of task revisions. If nothing else, members will generally invest more time understanding what the expectations are rather than working toward them. Assumptions can be most threatening in the initial stages of relationship development given that members have minimal knowledge of the leader's standards or behaviors. In short, communication is key. Tone, body language, timing, and appropriate content are all critical elements of explicit as well as implicit communication and should therefore be appropriately balanced and channeled.

Emotional elements in the group dynamic are equally powerful. Meaningful displays of compassion, for example, can breed group comradery, reinforce commitment, and promote selflessness. Abraham Lincoln once stated: "I'm a success today because I had a friend who believed in me and I didn't have the heart to let him down" (American Civil War Story 2012). Similar to the pressures felt by Lincoln, vocal and actionable displays of confidence toward the group, or a group member, can reinforce the overall objective by showing that personal risk is placed in the ability to achieve their portion of that objective. The tremendous inspirational value in this behavior can greatly empower the group and also reinforce the strengths and values of the collective peer-to-peer investments being made.

Equally significant within the group is actual task competency. Leaders must provide group members with the resources needed to confidently fulfill their duties without a sense of dependency on the leader or other members. Good practices would involve initial one-on-one assessments with the members to establish a mutually agreeable working relationship, with reoccurring meetings to serve as checks and balances. The aim should be to develop members toward task independence and self-sufficiency as reasonably appropriate. This enablement leads to greater satisfaction in working toward task achievement and promotes a greater sense of equity within the group. If the leader identifies potential risks or deviations in task achievement beyond the initial period, the leader must be able to accurately assess the threshold of task assistance needed, while avoiding discrediting the individual. The latter perception will translate into lack of confidence from the leader in the abilities of the individual. The impact could reduce member morale and disengagement from the group. More so, a poorly

handled intervention could be misperceived by other members and greatly influence group trust and alignment.

In addition to ensuring that all members are equipped with the resources and knowledge needed to complete their task, the leader should also provide a clear and in-depth explanation of why the task is significant. The latter will reflect consideration and respect which helps to support the emotional needs in group alignment. Not only by highlighting the overall value that the member is providing in completing the task but more so by showing that effort is being allocated to provide the explanation. In other words, it increases a sense of self-worth. This ultimately instills a trusting relationship that can boost morale and generally yield better performance (Akst 2007). Although much of the alignment process occurs early on, maintaining an open forum which welcomes members to vet concerns or unmet needs is crucial for overcoming issues beyond the early stages.

Alignment is a critical aspect in group performance. Role definition, as well as effective communication, will enable the alignment process and reduce assumptive decision-making. Alignment can be achieved with two general approaches. The first would leverage the preordained authority of the leader to dictate task assignment. The second approach intends to establish trust, rather than authority, as means to leverage the leadership role. Trust can promote the individual transparencies that foster genuine forms of alignment. The bonds forged in this approach are generally far more resilient than a dictated format, primarily due to the emotional value that trust delivers and the job satisfaction that it yields.

Without exception, trust among leaders and group members is a critical component for long-term success. To build trust, a leader must set high standards in ethics, transparency, selflessness, dedication, and confidence toward the group. Trust takes time and consistency to develop. Without trust, inspirational leadership is virtually impossible to convey. More so, genuine trust is often difficult to obtain as an authoritative figure. Having the self-awareness to distinguish when one's own behavior is perceived as authoritative, rather than inspirational, is equally as important as having the knowledge to adopt and value one versus the other. When one thinks of authority, thoughts of punishment or fear generally come to mind. Inspirational leaders on the other hand generally evoke trust, passion, and hope. In modern-day realities, many circumstances may require a dynamic ratio of each.

The leader should be mindful that too much flexibility in the alignment process can be counterproductive to group performance. Although consideration is beneficial, a willingness to adjust beyond initial task structuring can be perceived as inability by the leader to enforce accountability if objectives are not met. In other words, a perception may occur that a flexible leader is flexible in general, whether prior to or post task assignment. Allow the members to be comfortable enough in communicating their needs, but not to the extent where accountability is overshadowed. This risk may also induce members to see the leadership role as equitable, where attempts to assume task designation on their own may result. Members can potentially go beyond his or her role responsibilities and assume an informal authoritative position by directing other members as well. This behavior can have a tremendous impact on group alignment if role definition is not clearly established and reinforced as needed.

Various challenges in personality misalignment will occasionally arise that cannot be overcome through communication or task assistance. For example, a naturally domineering personality within the group may be too engrained for adjustment. In such dilemmas, alignment can be achieved by strategically allowing member participation in the decision-making process. These scenarios are quite common and effective for leaders when mitigated appropriately. However, clear role definition is critical in these circumstances. Otherwise, a partial display of power transfer can be misperceived as opportunity for the participating member to challenge the leadership role.

Although member participation in decision-making can have strategic utilization as a defensive mechanism, it is far more common as a supporting measure for leadership roles. These

relationships are most common within large, well-structured organizations whose leaders are in need of efficient decision-making due to limited personal bandwidth. For example, CEOs of large companies often depend on multiple layers of advisors and administrators whose responsibilities are to provide guidance or summarized analyses to expedite decision-making. These relationships often leverage trust and power sharing, but are rarely sustainable without clear role definition.

In a less formalized group setting or reporting structure, leaders will often develop ingroups (Lewis and Bates 2014). Ingroup formation takes place early on in the relationship development process and reflects weighted or preferred relationships between the leaders with select individuals. Leaders should be cautious to avoid ingroups altogether, more so if it is based on criteria that clearly presents no tangible support for the leader. For example, a leader should not align with a group member simply because they have similar taste in humor or similar interests outside the workplace. This behavior can be extremely disruptive to overall group performance. In general, signs of favoritism can result in negative work attitudes and task withdrawal among excluded group members. If the leader clearly sees disproportionate value in certain members based on skillset or experience and feels obligated to leverage those values, the leader should make every effort to remain objective and transparent in utilizing that relationship without displaying over appreciation as other members may feel disadvantaged and lose morale.

Motivation within the group is generally driven by the attitude of the leader. Some leaders are naturally charismatic and enthusiastic, whereas others are not. Nevertheless, leaders should make every effort to portray a strong sense of passion and enthusiasm when appropriate. Displaying high levels of engagement by sharing a long-term vision, showing a willingness to take personal risks and compassion toward members, and acting outside the leadership role are effective ways to inspire group members (Conger and Kanungo 1998). This type of behavior can be very effective in reinforcing group identity, increasing group commitment, and increasing overall member satisfaction. However, leaders should be aware of their actions and communications. Although certain inspirational behaviors can be effective, it should not be assumed that recycling the same messages and behaviors time and time again will yield the same results. Generally speaking, most group members are inclined to skepticism when leaders behave exuberantly and are exceptionally receptive to generic or disingenuous forms of motivation. Authenticity can rarely be manufactured when using inspirational messaging. As a leader, if genuine enthusiasm or belief in the vision statement is lacking for whatever reason, then perhaps more strategic or practical forms of inspiration such as incentives should be used if motivation is truly needed. Over time, group dynamics experience variant needs, both emotional and task oriented. Therefore, motivational support should be aligned in tone and delivery with situational variables. In some circumstances, the leader may have personal distractions unrelated to the workplace that impact his or her level of engagement and create a perception counterproductive in driving morale. Self-awareness in these circumstances can prevent the group from misinterpreting a negative emotional display as being related to the group. If personal issues cannot be mitigated properly, the leader may consider sharing an appropriate level of detail explaining the shift in behavior in order to prevent adverse group reactions, but also to reinforce the mutual respect and consideration toward the group relationship. If nothing else, this behavior reinforces a caring group culture.

Maintaining group motivation can be as challenging as any task that leaders face in group management. Highly intelligent group members will generally embody leadership qualities of their own and are less likely to respond to inspirational tactics given their experience and ability to screen for tangible content. Managing high performers can be as challenging or more than managing under performers. These individuals should be valued and carefully managed, as their skills are often leveraged more so than other members. Any methods of inspiration for these individuals should in some way be

tailored or differentiated, as their threshold for inspiration will undoubtedly differ from other members. If neglected or mistreated, their power can be leveraged within the group against the leader, or they may leave the group altogether.

The dynamics in achieving effective group output has traditionally suggested that two general leadership styles exist, transactional and transformational (Stam 2015). Transactional leadership being very task oriented and highly structured, whereas transformational leadership being inspirational and stimulating in nature. Transactional leadership in present-day settings may be less of an actual leadership role, but better labeled as a task enablement or task management role. Project managers, for example, may often provide no specific expertise such as marketing or engineering, but are rather given the sole responsibility of aligning the project team to meet clearly outlined action items. Their leadership role can be viewed as highly transactional given that the task achievement approach is very much structured and standardized. More so, the project team members can often be exceeding in experience or rank and do not share the same reporting structure as the leader. For this group dynamic to function, the project manager's ability to influence group members is generally limited to the dictation of standardized processes and project guidelines. The question arises of whether the definition of transactional leadership has changed in these types of standardized segments, or whether these segments are no longer considered to be leadership roles. Transformational leadership on the other hand can offer endless capabilities only to be limited by the actual prowess and character of the leader. Point being, the power of inspiration has the potential to excel the group performance beyond the limitations of any single individual within the group.

The challenges of leadership roles are ever changing, several of which have been mentioned that apply to internal group dynamics. Other issues however, such as false correlation with negative performance, require anticipatory engagement. Exceptional leaders can be faced with circumstances of which they cannot control, yet the outcome can have tremendous impact on group success. One example occurs when organizational leaders lose funding which supports critical group functions, ultimately resulting in failed project goals. Another example may be a military general that has the misfortune of losing half the platoon due to the spread of disease, leading to defeat. Although these circumstances are often uncontrollable, the status of the leader and the group falls victim to the external perception of association with failure. External perception is much harder to control than the internal group perception. In order to limit the impact of false pretense toward the group, the leader should engage in strategic external communication when appropriate, in order to provide insight to the challenges if he or she feels the need to protect self or group interests. The leader would also be emphasizing the responsibility and commitment in defending the group identity. More so, he or she would create a greater commonality within the group, as well as meeting the due diligence for having the leadership role.

"Uneasy lies the head that wears a crown" (Shakespeare 1596) is a bit audacious for present day-leaders; it does however reflect the burdens of leader responsibilities. To be a leader goes beyond internal management, it also entails the task of group identity and representation. If a leader is seen as incapable or unwilling to defend his or her members, confidence and trust within the group will surely diminish.

In the twenty-first century, leaders are faced with responsibilities that become more challenging as occupations and social lifestyles increase in variety and complexity. Globalization in the last decade alone has spawned endless cross dependencies among individuals or groups. Many of whom may often have conflicting peripheral responsibilities and beliefs. In parallel, as technology continues to advance, the human role in task achievement has changed the need for leadership in many traditional sectors. With the drivers of industrialization naturally favoring process standardization for the sake of efficiency, the structured nature of transactional leadership also conforms to standardization within commoditized group functions, further blurring the lines of perceived leadership as industrialization expands. Despite these realities, the need for authentic

leadership still exists in other settings, perhaps more than ever.

The previous suggestions on group leadership are not universally applicable and therefore should be challenged and tailored whenever taken into practice. Personalities are vastly complex, and even more so when merged with others. Having touched on the risk associated with assumptive decision making, aspiring leaders cannot assume that chance will offer the complementary circumstances needed for success. Rather, leaders must have the ability to assess, appreciate, adjust, and inspire in order to succeed, and as with any great leader, their value can rarely be denied.

# Leading Innovation

Anthony E. Middlebrooks
Horn Program in Entrepreneurship, University of Delaware, Newark, DE, USA

## Synonyms

Creative leadership; Idea leadership; Innovation management

## Definition

The process of influencing others and creating conditions to facilitate the generation of unique ideas and their translation into value.

## Introduction

The field of innovation across research and practice has exploded over the past 20 years, producing a rich and extensive collection of literature, tools, case studies, and general guidance. Navigating such extensive resources, however, may now only be possible at the broad level, leaving the details to the specific facet of innovation that one requires (Fagerberg et al. 2012). Numerous compilations and "handbooks" aspire to covering the broad range of the field, guiding one to additional sources (Fagerberg et al. 2005; Shalley et al. 2015; Shavinina 2003; Zhou and Shalley 2008). *Leading innovation* is one such specific facet, seeking to blend two extraordinarily complex and dynamic processes (leadership and innovation) to powerful ends.

Innovation is defined as the process of generating unique ideas and translating them into value. Innovation provides a consistent form of value for individuals, organizations, and societies. Forms of

value vary based on the focus of the entity and can include market share and economic capital, network and social capital, the degree to which a problem is addressed, individual development, and even added meaningfulness to a context (spiritual capital). While the form of value varies, generating a unique idea, approach, process, or system and subsequently using the latter to add value represents the essential benefit of innovation. Further, because ideas evolve and emerge from cross-perspective and related notions, fostering innovation is a positive causal loop – the more unique ideas are engaged, the more new ideas materialize (Johnson 2010). Consequently, influencing innovation enhances value by definition. Many factors influence innovation; however, individuals and/or groups serving as leader comprise the most purposeful and consequential (Amabile and Khaire 2008; Redmond et al. 1993).

Leadership by definition is a *process* of influence, which means it is *not* the person presently serving in the leadership position (and their related characteristics), nor is leadership a singular product. The latter notion is critical to leading innovation as iteration, failure, and continuous improvement represent key activities to both effective leadership and innovation. Leadership also differs from management. Classic management activities included forecasting, planning, organizing, commanding, coordinating, and controlling, with a common distinction: Management produces order and consistency, while leadership produces change and movement (Zaleznik 2004). In reality, a flexible leadership approach will include critical activities where leadership behaviors and management programs and systems work together (Yukl and Lepsinger 2005).

Leadership is the process of influencing others toward a *common vision*, and in this case the common vision is innovation – generating unique ideas and translating them into value. This vision differs from organizational effectiveness, improvement, growth, and/or quality control. Although not mutually exclusive, leading others to generate unique ideas and translating them into real value comprises a unique set of personal dispositions, leadership approaches, processes, and tools enabling one to create the conditions and culture that nurtures innovation. Thus, leading innovation is defined as: "The process of influencing others and creating conditions to facilitate the generation of unique ideas and their translation into value."

## Defining Innovation

From the user perspective, innovation often appears as a single solution or product – something new or better. But when viewed from the perspective of the innovator, the process begins with problem finding and identification, specifically seeking the best opportunity to add value. Understanding the full range of innovation provides a greater likelihood that the most impactful problem or opportunity will be the focus on innovation efforts. Innovations as an outcome have been delineated by areas. Keeley's (2013) ten types of innovation across the four subcategories of finance, process, offerings, and delivery include business model, networks and alliances, enabling process, core processes, product performance, product system, service, channel, brand, and customer experience. Innovation has also been parsed by the degree of uniqueness or change – such as adapt versus innovate (see Kirton's KAI, Mudd 1995), or accept, reject, or integrate existing paradigms vis-à-vis the new idea. The latter models cross degree of innovation with type of leadership activity (Sternberg et al. 2001).

Although not synonymous, creativity plays a key role within innovation. Creativity is responsible for the "unique" aspect of an idea and as such is a foundational individual capacity and process for innovation. Creativity is simply defined as the personal characteristics, press, and process that leads to the generation of unique ideas that have value. The term press refers to the contextual variables that influence creativity. Considerable research and applied work have focused on how a leader can enhance and utilize their own creativity, how creativity influences leadership, and how leaders impact creative activity and culture. Resources focused on the creativity-leadership

relationship are of significant practical value to leading innovation.

## Leading the Process

One important aspect of leading innovation comprises facilitating others through specific steps of the innovation process. Many specific and general innovation processes have been created, both descriptive and prescriptive. Process models can be found in research and practice and are described under a variety of related terms such as creative problem solving, ideation, heuristic, creativity, or design process. Despite their many forms and types, *all* innovation processes can be mapped onto a general process consisting of three major phases: *Understand, Imagine, and Implement*. The Understand phase examines what is known about the problem, context, stakeholders, history, etc. The Imagine phase emphasizes generating the most creative ideas for addressing the problem. And the Implement phase outlines the activities, resources, timelines, and other factors and actions necessary to bring the idea to reality (Dundon 2002). Activities and achievement within each of these major process phases (understand, imagine, implement) might consist of numerous activities depending on the specific model.

Each phase, including specific steps, contributes the most by enhancing two complementary activities – divergent and convergent thinking. Divergent is the process of expanding out to generate many, many ideas for a single problem, while convergent is the process of narrowing to identify a single best idea from a larger set. Again, the divergent-convergent complement should occur throughout the process. For example, one might divergently generate many possible sources to explore for further understanding a problem and then convergently choose the best sources. The two distinguishing elements of innovation – unique idea and translation to value – rely on maximizing divergent and convergent activities. A wide variety of techniques have been developed to prompt and guide both divergent and convergent thinking. These are basic tools that leaders can learn, employ, and teach to others.

## Personal Capacities

Another important aspect of leading innovation consists of identifying and fostering specific personal capacities that enhance one's own and other's ability to innovate. The dynamic nature of both innovation and leadership necessitate in situ and impromptu actions and decisions to best facilitate the process. Early research into the creative person comprised identifying individuals producing creative things (or for the effective leader, those leading effectively), and then observing and labeling their characteristics (Runco 2014). Unwieldy lists of characteristics or "traits" resulted. For leadership, these have now been summarized to include five most closely tied to effective leadership: intelligence, determination, sociability, self-confidence, and integrity. Creative person traits include curious, energetic, experimenting, independent, industrious, open-minded, perceptive, risk-taker, sensitive, and many more from lists that remain extensive.

More static notions of personal traits have given way to dispositions or habitual ways of thinking and processing information that can be learned and developed. Capacities such as those described as psychological capital (confidence or self-efficacy, resilience or grit, optimism, hope) have been found related to effective leadership (Luthans et al. 2007). Relatedly, dispositions enhancing creativity include open-mindedness, divergent thinking, and creative confidence. The root idea of confidence is trust in oneself; thus, creative confidence is trust in oneself as a creative individual; or as Kelley (2012) describes it: (individuals) "...natural ability to come up with new ideas and the courage to try them out."

Leading innovation includes the development of personal capacities as well as facilitating when to apply those capacities. Personal capacities for innovation enhance the *processes* of individuals and groups exploring and seeing multiple perspectives, taking measured risks in generating unique ideas, continuously improving outcomes, and overcoming blocks to these activities (Amabile and Pratt 2016). The set of dispositions called design thinking captures these personal capacities and is described as "an approach that

uses the designer's sensibility and methods for problem solving to meet people's needs in a technologically feasible and commercially viable way. In other words, design thinking is human-centered innovation" (IDEO 2015). The specific dispositions of design thinking include (Bruck and Middlebrooks 2010):

| |
|---|
| ***User-centered***: mind-set that focuses on the user and how they experience and feel |
| ***Explorative***: mind-set that assumes purposeful ambiguity and curiosity |
| ***Divergent***: mind-set of generating many, many ideas for a single problem |
| ***Multi-disciplinary***: mind-set that engages many minds and pursues multiple areas of expertise |
| ***Iterative***: mind-set of always seeing solutions in process – assessing and improving |
| ***Integrative***: mind-set of attending to and balancing multiple and contrasting variables, and creatively resolving the tensions between them |

Design thinking dispositions generally align with the different phases of creative problem-solving and have been utilized to enhance innovation on specific projects and generally (Reiter-Palmon and Illies 2004). Organizations use design thinking for internal challenges, developing individual employees, more fully engaging customers, building better teams, exploring and identifying opportunities, and expanding the time that employees generate ideas. Most significant, design thinking represents a shift in mind-set and consequent ways in which leaders and followers address problems and one another.

Leading innovation as enhancing personal capacities and facilitating process are integrally intertwined. Another model aligns thinking habits directly with the formal creative problem-solving model (Puccio et al. 2011). The process and aligned thinking skills are noted in Table 1.

In addition to traits and dispositions, effectively leading innovation requires the personal capacity to see and eliminate variables inhibiting or mentally blocking creativity at all levels – individually, group, organization, and culture – "blockbusting" as Adams (1986) terms it in the foundational source on conceptual blocks. Blocks can also be psychological (fear), cultural (norms), social (other's judgement), literal (deadlines, distractions, environment), as well as conceptual (how you see things). The most detrimental block, self-editing or self-censoring, kills creative ideas – what Matthew May (2016) calls "ideacide."

## Leadership Style: Transformational and Authentic

Two formal leadership approaches have been most extensively examined relative to leading innovation: transformational leadership and authentic leadership. Transformational leadership is characterized by the four I's of individual consideration, intellectual stimulation, inspirational motivation, and idealized influence (Bass 1999). Numerous studies have shown transformational leadership has significant effects on creativity (Gumusluoglu and Ilsev 2009; Khalili 2016). At the individual level, transformational leadership influences employees' creativity through psychological empowerment. At the organizational level, transformational leadership is positively associated with organizational innovation. However, in some studies the effects were mediated by promotion focus and creative process engagement, by emphasizing

**Leading Innovation, Table 1** Thinking habits aligned with creative problem solving

| **Creative problem-solving stages** | Assessing the situation | Exploring the vision | Formulating challenges | Exploring ideas | Formulating solutions | Exploring acceptance | Formulating a plan |
|---|---|---|---|---|---|---|---|
| **Thinking habits that facilitate CPS stage** | Diagnostic thinking | Visionary thinking | Strategic thinking | Ideational thinking | Evaluative thinking | Contextual thinking | Tactical thinking |

a learning orientation, or by applying leadership to a specific part of the creativity process. Yet other studies indicate limited effects of transformational leadership, and even negative effects like increased follower dependency, which decreased creativity (Eisenbeiß and Boerner 2013).

Authentic leadership consists of a broader group of approaches that promote a positive psychological, relational, and ethical climate, which has been found to foster creativity in employees (Rego et al. 2012). Authentic leaders attend to follower psychological capital (self-efficacy/confidence, optimism, resilience, hope), which has been associated with increased creativity, particularly in the case of self-efficacy (Avey et al. 2012).

The general takeaway from these findings is that there are no simple recipes stating: Do this leadership style and it will result in that performance outcome. Recent research reviews indicate less influence of general leadership style versus the impact of specific leadership strategies (Tummers and Kruyen 2014), such as empowering followers (Zhang and Bartol 2010) and increasing self-efficacy. Leadership and innovation are simply too complicated, individual-based, context-based, and situational. Consequently, research on what factors promote and inhibit creativity, and the variables that mediate those effects, comprises another rich field of inquiry and application.

## Culture and Climate

The most impactful aspect of leading innovation lies in creating the conditions and culture for creativity to flourish while establishing the parameters and process of managing the translation of creativity into value. This essential paradox identified by Hill et al. (2014) nicely summarizes the dynamic and mindful challenge leaders face in facilitating the right balance for each individual and for the larger organization. Hill et al. describe six specific paradoxes that inform an organization's innovation efforts. Leaders should assess the organization on each paradox and then compare that assessment to what aspect of each paradox *should* be emphasized to maximize innovation given the present circumstances. The six paradoxes include (a) individual identity versus collective identity, (b) support versus confrontation, (c) learning and development versus performance, (d) improvisation versus structure, (e) patience versus urgency, and (f) bottom-up initiatives versus top-down interventions. Leaders of innovative organizations balance these paradoxes to achieve three capabilities. According to Hill et al., innovative organizations have creative abrasion (having a marketplace of ideas and perspectives through discussion and debate), creative agility (systems and processes to quickly try, assess, reflect, and refine ideas), and creative resolution (decision-making processes that integrate opposing ideas by taking a both/and approach). Note that creative abrasion, agility, and resolution each require a mindful mix of both leadership and management activities.

Fostering a climate of creativity and innovation is perhaps the most impactful aspect of leading innovation. Climate refers to the psychological, emotional, and practical conditions that enhance (or inhibit) innovation. Those conditions, when institutionalized in systems and structure and normed into practices, result in culture. Informally, culture is defined as the way things are done around here, including the often invisible norms that influence thinking and behavior. Ekvall (1996) outlines ten climate dimensions impacting creativity in organizations, which leaders can purposefully design into the follower experience:

Challenge – How challenged, emotionally involved, and committed? How meaningful do they find the work?

Freedom – How much autonomy in planning, deciding, and acting?

Idea time – How much time to generate and elaborate on new ideas?

Dynamism – How many new things, different perspectives, and "eventfulness"?

Idea support – How much active listening, encouragement, and attention to new ideas and perspectives?

Trust and openness – How emotionally and psychologically safe to propose new ideas?

Playfulness and humor – How relaxed and play oriented?

Debate – How much encouragement and pursuit of diverse perspectives?
Risk-taking – How willing to try new things and tolerate uncertainty?
Conflicts – In the negative sense, how much interpersonal conflict, hostility, etc., blocks the creative climate?

Designing a culture fostering innovation must accurately assess the climate from the user's perspective. *KEYS: Assessing the Climate for Creativity* is one reliable, valid tool for assessing the work environment dimensions that play a role in creativity (Amabile et al. 1996). Using comprehensive research on creativity in organizations, the KEYS looks at work environment dimensions that support creativity:

- Management practices like freedom, challenging work, encouragement of creativity through management, and work group supports
- Organizational encouragement
- Lack of impediments
- Sufficient resources
- Realistic workload pressures
- Creative and productive output

The KEYS and other measures can be used by leaders to diagnose the relative degree to which work environments foster creative work and effectiveness of work environment improvements.

Summarizing the research, Shalley and Gilson (2004) came to three practical conclusions: First, followers need to feel supported – by the leader, their colleagues, their work, and the organizational culture. This includes adequate resources, rewards, and recognition. Second, leaders must clearly communicate that creativity and innovation is a valued goal, including modeling by the leader and rewards for creative outcomes. Third, leaders must create opportunities for followers to interact with a rich and diverse pool of skills, interests, and perspectives. Table 2 lists forty suggestions for leading innovation drawn from research and practice. The dynamic nature of individuals and organizations makes leading innovation a complicated endeavor; however, the benefits of designing a climate, developing

# Leading Organizational Change

Brian Beauregard
University of Massachusetts, Boston, MA, USA

## Synonyms

Champion of change; Directing change; Executing change; Leading systemic change; Optimally shaping business transformations; Reorganization; Restructuring organizations

## Definition

Change affects every organization, and it is imperative that managers prepare for it and effectively lead and support their employees through transitional periods. In recent years, change occurs so quickly that it is essential for managers to create and maintain a culture of change in their organizations in order to adapt swiftly and sufficiently. The chapter will discuss the driving forces of organizational change and how leaders can effectively implement change.

## Introduction

Change is happening at an increasingly rapid rate and organizations across all industries that do not plan for it will not prosper. Some of the internal and external catalysts for change are technology, competition, expansion in workplace diversity, globalization, regulatory agents, and the surplus or lack of resources (Lewin 1945, 1947; Argyris 1999). Before planning and implementing a change, managers need to be cognizant of and sensitive to the fact that most people fear change and unknown outcomes. There are several techniques that will help mitigate resistance to change such as maintaining open communication, establishing trust, engaging all employees in the change process, reducing employee stress, and creating a positive, nurturing environment that is supportive of innovation and flexibility (Kotter 2007). Subordinates should be allowed to freely and openly contribute their feedback on change that will impact their jobs; managers should consistently give them this platform to express themselves and foster a culture of change.

## The Driving Forces of Change

Of the driving forces that cause the need for organizational change, one of the most influential within the past two decades is innovations and advancements in technology. As technology continues to become increasingly highly automated, the need for human interaction has decreased tremendously, and this has led to a vast reduction in manufacturing and service industry jobs. Humans are competing with computers that can do their jobs faster, and in most cases, automation yields a higher profit due to the reduction in payroll and operating expenses. Technological advancements

continue to reshape the workplace and workflow processes; it is not a fad that will phase out, and because of this, organizations need to progress and adapt in order to remain competitive in their perspective industries. Managers should prudently invest in both technology and their employees. Wide sweeping change can carry a lot of risk and may cause chaos in an organization especially if it is not thoroughly planned and executed. Incremental changes should always be considered because it carries less risk both operationally and financially, gives the employees more time to adapt, and allows the management team to analyze the results and to reevaluate before introducing the next phase of the implementation. One technological development that a manager should consider is having their employees work from home; this trend is increasing over time. This greatly reduces the cost associated with maintaining an office space and it reduces the employee's transportation expenses. It also gives the employee greater flexibility and capacity to create a harmonious work/life balance.

Competition is another harbinger of change. The speed in which a new product is launched from design to market has accelerated drastically in recent times. This causes extreme pressure for organizations to quickly adopt new business platforms and processes. However, industry regulations, quality controls, and safety should not be compromised to meet deadlines or to cut costs. Managers may use an incentive program to reward employees for creative and innovative achievements; this will help create a culture of change and motivate employees to want to succeed in future endeavors.

The workplace continues to become more diverse in respect to sex, gender identity, age, race, ethnicity, sexual orientation, disability, and religion. Organizations should both accept and celebrate the changing diversity in the workplace. Managers need to recognize that a team has a greater chance at achieving success when everyone contributes and collaborates. Inclusivity is essential to creating a positive work environment that is accepting of all employees. Cultural diversity competency trainings should be conducted so that employees understand that acceptance and inclusivity are part of the organization's values. When hiring, promoting, or even engaging with employees and potential employees, managers should avoid making assumptions predicated on stereotypes or preconceived identity-based judgements. It is not only discriminatory but it is also not based on facts. Two examples of stereotypes are younger employees perform better at their jobs than older employees and woman are not as effective leaders as men; studies have found neither to be true. There is no evidence that shows younger employees perform better than older employees at their jobs (Tergesen 2014). Women have been found to be equally as effective as men in leadership roles (Paustian-Underdahl et al. 2014).

Globalization has strongly affected organizations and has created both opportunity and challenges. By outsourcing labor, an organization can make a significant reduction in cost. Senior management must weigh the benefits of cost reduction to the desire to support their local community. If an organization is in danger of going out of business, outsourcing labor to reduce labor costs might be their only option to persevere. Incremental change can be used in this scenario as well; if time is on the organization's side, begin with outsourcing one department or one aspect of a department. The number of global organizations has also increased in recent years and this has presented new, unique challenges. Tax codes and laws vary greatly in different countries. Having subordinates in different countries imposes a barrier because the most effective mode of communication is face to face. Managers must adapt to these changes by utilizing videoconferencing and teleconferencing to communicate when face-to-face communication is not possible. Managers will also need to learn the cultural norms, practices, and values in order to effectively lead a team that is in another country.

Regulatory agents such as tax codes and state and federal laws are continually changing, and organizations need to be in compliance with the changes that are passed. This need for organizational change is brought about by an external force and it is mandatory by law. Managers can be upfront and honest about these changes with their employees and provide them with details

and guidance on why the compliance regulations have been changed. If properly educated on the matter, the employees will understand that these changes were prompted by a regulatory agent and not by the organization.

A change in resources may drastically impact an organization depending on the scale and whether it is a surplus of resources or lack of resources. If an organization has a surplus of funds, a manager may use this as an opportunity to invest in something that will enhance the organization's mission statement. A lack of resources may be seen by managers as an indication that something needs to be changed in order to keep the organization functioning well. Examine workflows and determine if there are changes that can be made to make it more efficient so that employees can accomplish more with less resources. Limited resources may also be seen as a gateway to the inception of innovations.

## How Leaders Can Effectively Implement Change

Maintaining an open communication on why change is necessary is essential to creating a culture of change. Since verbal communication is the most effective mode of communication, it should be delivered in this way because it is extremely important that communication regarding change is not misinterpreted. Face-to-face communication is recommended either in a one-on-one meeting or in a group meeting if the change affects the whole group. Managers should thoroughly explain the need for change. For example, if there is a new product that must make it to the market before a competing organization does, one way managers can effectively meet a deadline to launch a design into production is by applying the punctuated equilibrium model to the team group. The date of the deadline and each employees' roles and expectations should be clearly communicated to them, and the timeframe and expectations need to be reasonable. When using the model, managers should expect that little to no progress will occur after the initial meeting, and then miraculously, a burst of enthusiasm and progress will follow exactly in the middle of the deadline timeframe. A stagnant period will resume after the midpoint group meeting, but a wave of enthusiasm will return near the end date of the set timeframe, and the goal will have been achieved. When the application of this model is used appropriately, the group project is successful more often than not. Effective communication is essential to succeeding when using this model (Garfield and Denis 2012).

Establishing trust will greatly improve a manager's chances of winning over employees' willingness to adapt to organizational change, and it will reduce employees' anxiety during periods of change. Trust is built over time between managers and their subordinates, and if attained, it will lead to organizational commitment, loyalty, and higher job satisfaction rates which correlate to higher productivity levels. Trust building can be strengthened during a period of organizational change. One example of the benefits of establishing trust during a transitional period is if an organization suddenly experiences a massive loss in funding. Managers should articulate to their employees exactly what is happening with the funding and enlist their aid in finding solutions. At the other end of the spectrum of trust is manipulation. Managers that use manipulation to assist in implementing change should do so with great caution. It carries a lot of risk because if the employees find out that they were misled or told something that was false, trust will be broken, and they may carry resentment against the organization.

Engaging employees in the change process will prepare them for current and future changes. Managers should allow employees to participate and have the right to influence decision-making that will be impactful to their jobs. If employees feel that they have a role in the decision-making, they will view organizational change more favorably. Employees may have some insight into what can be changed within their workflows and processes and can identify what can be altered to make things operate more efficiently. They may find waste in their workflows and if eliminated, they will produce more in the same amount of time.

A growing number of organizations are investing in wellness programs for their

employees to reduce stress. Some stress can be beneficial as it can motivate an individual, but an unmanageable abundance of stress can negatively impact productivity, and it can lead to quickened job turnover. The wellness programs will support employees in times of organizational change. Another coping mechanism managers can provide during periods of change is an appropriate platform that will allow employees to vent their frustrations without the threat of punitive retaliation. Solutions do not necessarily have to be provided, and it gives the employees another coping mechanism to handle stress. Sometimes through venting out frustrations, an unexpected positive by-product is a resolution or the start of an idea that will lead to one.

Managers can develop a culture of change by creating a positive, nurturing environment that is supportive of innovation and flexibility. To encourage innovation, accomplishments should be rewarded and failures should not be penalized. Recognition of employees through praise may also be used to show them that they are greatly valued by the organization and this does not cost anything; it also assists in cultivating a positive work environment. Managers may look at a lack of resources as an opportunity because when resources are scarce, the creation of innovations is at its highest. An example of this is the development of green technologies to replace the dependence on energy created by fossil fuels. In addition, managers should recruit and hire employees that adapt well to change and have a high tolerance for ambiguity. Have all job applicants take a test that measures their tolerance for ambiguity (Menzel and Jurkiewicz 2005). During the interview process, managers may also ask the following open-ended questions to see how well they adapt to change: describe a change that took place at a previous job, what was your role in this change, and what did you do to help make this change successful? Also, when hiring, managers should recruit employees whose values align with the organization's values because when they do align, the employee's job satisfaction is higher, they are more loyal to the organization, and they are more likely to stay at the organization longer.

## Conclusion

In conclusion, organizational change is inevitable and continual, and by becoming an agent of change, managers have the power to influence how well their employees adapt to it. The traditional jobs that required their employees to simply maintain the status quo for 40 years are fleeting. Adjusting well to organizational change is the new status quo of our times. Managers should be hypervigilant to the driving forces of change that are prevalent in their perspective industries, and they should try to stay ahead of current standard business practices in order to remain competitive. Managers should be proactive by preparing their employees for change and by identifying the signs of employees' resistance to change; the earlier it is identified and addressed, the better. Lastly, once a culture of change is established, it must be maintained and nourished so that the organization is best prepared for future changes; this will give the organization its greatest chance at prosperity (Kim et al. 2015).

# Leading People-Centered Cultures

Jeanette Black
College of STEMM, University of Wisconsin Stout, Menomonie, WI, USA

## Synonyms

Employees; Leaders; Leadership; People; People-centered organizational cultures; People-focused culture

## Definitions

*Organizational culture*: A collective experience that emerges from the beliefs and social interactions of its members.

*Organizational climate*: A set of measurable properties of the work environment, perceived directly or indirectly by the people who live and work in this environment and assumed to influence their motivation and behavior.

*People-centered organizational culture*: An organizational culture focused on employees that builds trust, leverages the talent within the organization, and used to develop performance measures and business success factors that are reflective of the employee culture.

*High-performance organizations*: An organization that embodies *people-first values*, creates a strong and positive culture of trust among its people, and thus sustains a high level of profitability.

*Leadership*: An influence relationship among leaders and followers who intend real changes and outcomes that reflect shared purpose.

## Introduction

The dilemma for today's organizational leaders is described in terms of balancing shareholder demands with achieving longevity or sustainability. More accurately, the dilemma has been about providing an environment that espouses individual freedom while ensuring that the financial and nonfinancial targets of the organization are met. When an organization is focused on the numbers, rules, and regulations, inevitably systems and processes tend to be developed to ensure staff conformance to those rules. Such quantitative targets dictate organizational behavior. Rules and regulations control behavior, stifle creativity, and build an environment based on mistrust, self-interest and ambition, deceit, and complaints. When the cultural environment of the organization is designed to focus on its people (employees), the opposite happens. An employee-focused culture builds trust, leverages the talent within the organization, and can be used to develop performance measures and business success factors that are reflective of the employee culture. Such organizations consistently perform at exceptional levels over an extended period of time.

## People–Centered Organizational Cultures

People-centered organizational cultures are founded on the ideas that

- All people are important.
- A strong belief in people shapes the organizational culture.

- Happy people working together perform at higher levels.
- All people benefit as a result (Black and Laventure 2015, p. 9).

**All People Are Important.** The view that all people are important provides the foundation for creating an exciting, supportive, dynamic, and innovative work environment while resulting in substantial growth and profits. To accomplish this, organizational leaders, middle management, and frontline supervisors shift the focus from numbers and results to the organization's greatest asset – its employees. Six characteristics used to drive high performance in people-centered organizations, focused on individual involvement, and effective leadership are:

- Organizational cultures can be the ultimate competitive advantage.
- Involvement can be the most effective source of control.
- All employees add significant value.
- Lateral processes are the key to organizational efficiencies.
- Organizations are designed around people, products, and customers.
- Efficient leadership focused on employees is the key to organizational leadership (Black and Laventure 2015, p. 10).

As a result, workers perform at the highest level – every day, that opinions count, that coworkers share the commitment to quality, and that a personal connection between the work and the company's mission is developed. The impact of the people-focused culture is substantial and synergistic.

Company leaders must create an environment where trust, creativity, and innovation flourish, while meeting the performance criteria specified by the stakeholders. Applying this philosophy to organization design ensures that the nature of the organization is shaped by the people in the organization. The starting point for designing, developing, and transforming an organization lies in the leader understanding the people in the organization and the relationships between these individuals and external stakeholders (Weymes 2005). Leaders develop the vision and goals, creating a focus on the customer, and developing systems and processes are important. Leaders who create an environment that allows employee's freedom generates new and innovative approaches, fosters harmonious working relationships, building trust and integrity.

The starting point lies in the nature of the relationships among employees. Employees are rational individuals who are seeking self-actualization (achieving one's purpose in life), happiness, and wisdom. Therefore, an organization's performance depends on the nature of the relationships formed by individuals within that organization and relationships with external stakeholders. Unfortunately, the workplace can often create a work environment where employees have little commitment to their employer and, therefore, little loyalty (Weymes 2005). A leader's belief in people and the accompanying values of treating each person and task with dignity, trust, and respect serve as both the bedrock foundation for business decisions and a springboard for performance, growth, and innovation. Thus, all employees benefit in the challenges, risk, and success of the organization, resulting in increased employee engagement and commitment (Black and Laventure 2015).

**A Strong Belief in People Shapes the Organizational Culture**. Leaders of people-centered organizational cultures view employees and employment as a long-term investment, a source of competitive advantage that must be supported and protected at all times. Leaders of organizations with people-focused organizational cultures are constantly changing and adapting to new ideas, people, resources, technology, challenges, and opportunities (Black and Laventure 2015).

**Happy People Working Together Perform at Higher Levels**. In today's fast-paced business environment, the quality of working relationships and trust generated by unwavering business integrity is emerging as a key competitive and strategic advantage. People-focused cultures, coupled with effective leadership, help managers respond more rapidly to customer needs and changes in the

business environment. Because leadership and frontline managers care deeply about their people, they tend to listen more intently to what the company's various stakeholders have to say. These adaptive organizations consistently and substantially outperform companies with more traditional corporate cultures on four major measures: revenue, workforce expansion, stock price, and net income. For leaders to ensure that there is a high degree of commitment among the employees, it is necessary to make certain that a match exists between the purpose of the organization and the dreams of the individuals (Weymes 2005). Individual inspirational dreams become the inspirational dreams of organizations.

**All People Benefit**. When leaders at all levels truly believe that all people are important and support that belief with their actions, amazing things can happen. There is a strong correlation between a belief in people, working together, and long-term profit and growth for everyone involved (Black and Laventure 2015).

## Leadership and Organizational Culture

The content formation of organizational culture begins with the decisions made by organizational leaders. Creating and managing organizational culture is the single most important role of the leader (Schein 2010). Top leaders set the tone of the culture by defining the goals of and for the organization, which are then operationalized throughout the company.

## Seven Key Leadership Elements of People–Centered Cultures

Research by Black and Laventure (2015) suggest that people-centered organizational cultures share the following key elements:

- Leveraging people-first core values.
- Leadership that walks the talk.
- Open communication.
- High levels of trust.
- Aligned operations and work environments focused on HR and talent development practices.
- Change responsiveness.
- Organizational resiliency (p. 16).

These elements are incorporated into the fabric of the organization and are built on the aspirations, talents, and dreams of the employees and constantly interact with and shape each other. Organizations that promote such values as openness, trust, initiative, teamwork and collaboration, the humane treatment of workers, creativity, quality, empowerment, and delegation obtain better results (Huang and Dastmalchian 2006). As a result, organizations experienced significantly lower employee turnover when they valued respect and teamwork.

## Leading High–Performing Organizations (HPO) as People–Centered Organizations

Although the concept of being a high-performance organization (HPO) is becoming increasingly important, the concept is still not well understood. Although there may be a lack of understanding of the HPO concept, there is significant evidence that HPOs drive business results. Leaders of HPOs spend the time and money to create and support positive stakeholder relations and cultivate high-performance work environments which are worthwhile investments repaid with significant returns to the firms. The culture of an HPO shapes its worldview. This, in turn, predisposes behavior in the organization. The hallmark of an HPO is the people-first core values. By creating a people-focused culture with a focus on creating a wonderful environment for employees, the culture sets the tone for employees to also treat customers and other stakeholders well. Leaders of HPOs produce higher levels of employee productivity, stronger customer loyalty, and higher profit margins (Black and Laventure 2015).

The leaders of an HPO can be thought of as *connectors* (Gladwell 2000). Connectors are significant because of the ability to link people, ideas, and resources. In HPOs, leaders facilitate collaboration between all stakeholders through the connections created. Furthermore, these leaders can bring people together from different disciplines, backgrounds, generations, and cultures and leverage all those individuals have to offer. These connections allow for the development of creativity, innovation, and problem solving among stakeholders while promoting a healthy workplace environment. It is important that the leaders of HPOs set the tone by being good connectors and collaborators themselves and assigning clear decision rights and responsibilities (Black and Laventure 2015).

Leaders consciously and unconsciously embed their tendencies and preferences into their organizations through a variety of mechanisms, such as metrics; criteria for the allocation of rewards, such as profit sharing and bonuses; and personnel decisions (Schein 2010). The most influential of these practices are leadership, recruitment, onboarding, reward-system alignment, decision-making processes, and organizational learning (Verbos et al. 2007).

Leadership, culture, and strategy are interrelated. Leaders further reinforce organizational culture through secondary articulation or reinforcement mechanisms, such as organizational design and structure decisions, stories and myths, and formal statements (Schein 2010). Effective leaders also continually shape the culture through their strategic vision, determining what receives attention and what is celebrated (Hartnell and Walumbwa 2011). Successful execution of strategy requires a supportive organizational culture.

Although organizational leaders shape organizational culture, cultural norms and expectations must be disseminated throughout the organization. *Cultural carriers* – the formal and informal leaders throughout the organization – reinforce the thoughts and actions of the cultural leader; this support is known as *walking the talk* (Armenakis et al. 2011). These manifestations are interpreted, evaluated, and enacted in varying ways because cultural members have differing interests, experiences, responsibilities, and values. Therefore, what leaders do and how those actions are carried through and manifested in the culture are more of a determinant of effectiveness than what leaders believe or value, because the manner in which beliefs and personal values manifest in the day-to-day actions of leaders can vary widely (Nieminen et al. 2013). These become the motivational drivers for success within the organization.

## Effective Leadership and Organizational Climate

A *positive organizational climate* – a good workplace environment – is often the byproduct of effective leadership. Effective leadership is crucial to superior business performance. Leaders recognize that the effectiveness of an organization's leaders can be the difference between being a good and being a great organization. They also understand the profound impact, the decisions of founders, and other top leaders in the early stages of the organization's life cycle have on the development of that organization and that those decisions lead to the creation of strategies, structure, climate, and culture (Schein 2010).

Leaders directly influence the behavior and actions of the organization's members, as well as perceptions of those members. According to Momeni (2009), "more than 70% of organizational climate directly results from a manager's morale and behaviors" (p. 46). Emotional intelligence "refers to an ability to recognize the meaning of emotions and their relationships, and to reason and problem-solve based on them." Emotional intelligence is further defined as one's ability to manage and monitor one's own emotions, to recognize different types of emotions in others, to distinguish the difference between one's emotions and those of others, and to possess the ability to direct information toward decision-making

actions (Mayer and Salovey 1993). Emotional intelligence has been identified as a measure for distinguishing superior leadership skills and abilities (Kersten 2007).

When leaders of people-centered organizations put these values into action, these organizations and the stakeholders (e.g., their employees, vendors, suppliers, and partners) benefit. These values put into action create the organizational climate, which is a relatively enduring characteristic of an organization distinguishing it from other organizations and embodies members' collective perceptions about the organization related to autonomy, trust, cohesiveness, support, recognition, innovation, and fairness (Kersten 2007). If the leaders walk the talk and truly put the value system into action, employees will become the very fabric of the organization and will be integral to its success.

The successful implementation of strategies is aligned with an organizational leader's effectiveness in making decisions, the effective marshaling of resources and capabilities, and appropriate responses to the environment (Connell 2001). Strategic awareness must therefore include self-awareness on the part of the managers, including an awareness of their own management style and its possible influence on employees and the organization's culture (Osborne and Cowen 2002). By walking the talk, leaders of people-centered cultures create environments that foster communication, build trust, and facilitate teamwork.

Leaders of people-centered cultures are aware of their actions and how they are interpreted in people-centered organizational cultures. This awareness and behavior is reflected in and modeled by genuineness, care, and authenticity of the leader and leadership within the organization (Norman et al. 2005). People-centered organizations have leaders who can read and predict through complexity, think through complex problems, engage groups in dynamic adaptive organizational change, and manage emotion appropriately. Leadership is the key to how internal and external organizational dynamics translate and link internally to the organization and externally to the community.

## Leaders of People–Centered Cultures Defining Responsible Global Citizenship

In order to enhance organizational performance, leaders of corporations need to focus on their social dimensions. This means that they need to strive to align both the individual and the collective interests of employees, and the employees need to match personal values, capacities, and ambitions with those of the workplace environment. The alignment of personal and collective interests has become essential to contemporary business. No longer can companies treat their employees as resources, as numbers, as costs, but as human beings. Employees should not be thought of as assets or liabilities but, rather, as human beings, who have social needs (Black and Laventure 2015).

## Organizational Ethics and Moral Fitness

Organizational cultures can also be classified as either ethical or unethical, which can be described through the company's policies, procedures, operating principles, and training (Schein 2010). Leaders of companies that invest in instilling ethical principles in their organizational culture demonstrate a strong commitment to their organizational values, empowerment, and trust. Ethics provides standards in an organizational culture and the framework for decision-making. However, the top leaders must model ethical behavior and must show high levels of trust and respect to their fellow members of the culture. Leaders need to help employees think through ethical issues and decisions, especially those "right versus right" dilemmas that pit one moral choice against another. Corporate culture and ethics can represent a powerful decision-making tool.

To achieve a people-focused culture, leaders need to include the management of business toward the common good instead of the management of business exclusively for profits, power, or any other interest if those are contrary to the common good. Caring for people and a sense of service generates loyalty. Recognition and respect for people and their human rights, care, service, and management toward the common good must be shared beliefs and values in a people-process culture. Leadership at all levels of the organization must demonstrate genuine care for employees. Respecting people and their human rights also means integrity, with a steadfast attitude of trustfulness, keeping promises and fulfilling contacts, fairness, and organizational justice. In other words, people assist, support, and compete with one another through care and service (Black and Laventure 2015).

## Corporate Social Responsibility and Sustainability

Russell et al. (2007) determined four distinct understandings of sustainability in organizations. Leaders described sustainability in terms of.

1. A corporation working toward long-term economic performance.
2. A corporation working toward positive outcomes for the natural environment.
3. A corporation that supports employees and social outcomes.
4. A corporation with a holistic approach to conducting business within a community.

Doing business is no longer only making profits; leaders of people-centered organizations also must behave in a socially responsible way. This responsibility includes not only environmental concerns, such as minimizing the organization's carbon footprint, but also must be expanded to include social system issues and international economic issues that must be highly integrated into the organization (Metcalf and Benn 2012). This quest for new and expanding responsibilities – often called *corporate social responsibility* – implies considering issues beyond the conventional scope of a business.

Corporate social responsibility refers to a growing appeal asking organizations to take a broader social responsibility into account, behaving accordingly in an accountable manner, thus behaving as good corporate citizens (Schoemaker et al. 2006). Organizational change is embraced and that an ethical approach to work is developed among all employees for organizational sustainability. Employees become the sustainability champions for the company and the community. The focus of corporate social responsibility defines the corporate identity, making the company more transparent, trying to develop a system of accounting for one's actions (Driscoll and Hoffman 2000). These are characteristics of people-centered organizations.

Sustainable leadership for a people-centered organization can be described as one that reflects the definition of the sustainable organization as those organizations that build on natural capital enhance human and societal welfare and contribute to appropriate economic and technological development (Russell and McIntosh 2011). These companies are innovative and people focused. Sustainability principles are embedded across the organization and within every aspect of the organizational culture. Leaders of people-centered organizational cultures conduct business through the adoption of long-term perspectives that support their employees, business, and communities.

# Leading the Ethical Organization

J. Travis Bland
Department of Public Administration,
University of Illinois at Springfield, Springfield, IL, USA

## Synonyms

Ethical management; Moral administration; Moral leadership; Organizational integrity; Public service ethics and leadership; Responsible leadership

## Definition

Behavioral ethics: Descriptive effort aimed at explaining the processes that produce decisions, whether ethical or unethical.
Bounded awareness: When, due to the limitations on human rationality, people fail to see and use information that is readily available to them.
Ethical blindness: When the ethical dimension of a decision is not visible to the decision-maker and the values that normally would shape their decision-making are left out of the process.
Normative ethics: Prescription of strategies or methods for weighing alternative courses of action on the basis of the principles that ought to govern the ethicality of a decision.
Special relationship: Relationship between public servants and citizens in America that includes the obligation to serve the public interest, while guaranteeing and advancing certain values.

## Introduction

As discussed by Frederickson and Hart (1985), there is a "special relationship" that exists between public servants and citizens in America. This relationship is built on what the authors term the "patriotism of benevolence," which requires that public servants share a commitment to the fundamental principles of the regime and a genuine concern for the well-being of their fellow citizens. When public servants are party to acts that are deemed unethical or immoral, they violate the "special relationship" and public sector organizations pay a high price. Not only does it have the potential to damage the reputation of the organization, it may undermine the trust and confidence that citizens place in their government. It would be a mistake, however, to attribute such failings solely to the character or disposition of the public servants. Organizational structures and cultures are not neutral with respect to ethical conduct. They typically play a much more powerful role in shaping human behavior than might be assumed (Zimbardo 2007). For this reason, a modified version of one of Cooper's (2004) "big" questions for administrative ethics guides the remainder of this chapter. What do public sector leaders need to know to design and oversee organizational environments that are supportive of ethical conduct? In other words, what do they need to know to lead ethical organizations and, thereby, protect and promote the "special relationship"?

Organizations are human creations formed to serve specific purposes. They function as socially constructed systems, such that the interactions and decisions of their members will have a structuring effect that constrains and enables future activities (Giddens 1984). The study of administrative ethics at the organizational level, then, is fundamentally about the situational pressures unique to the organization and its environment that influence the decision-making processes of public servants (Dobel 2006; Wittmer 2005). Leaders who understand these pressures are better equipped to design and oversee organizational environments that are supportive of ethical conduct. Here, the term ethical conduct refers to decisions that are in accordance with the principles of right and wrong governing the conduct of individuals in their organizational and public service roles (Svara 2007). Those principles are embedded in and defined by the "special relationship." They infuse public sector organizations with higher institutional purposes, namely, to serve the interests of the people, upon which public servants must evaluate their moral and professional obligations (Heclo 2008). In addition to promoting and modeling those principles, ethical leaders will develop safeguards against their violation (Denhardt 1988; Menzel 2007).

Individuals, however, do not come to organizations as blank slates. Instead, they bring with them their own cultural, educational, and professional experiences, values or character traits, interests, and ethical orientations. Some individuals will attempt to use organizations to maximize their self-interests, whereas others may be more altruistic. Organizations and their leaders can attempt to screen and hire individuals that meet a certain ethical norm or standard, but this is quite hard to assess. The ethical organization, then, will nurture the ethicality of its members, but recognizes that this alone does not ensure ethical decision-making. Sometimes individuals, even if they are highly developed morally, do not recognize that the decisions they are making have ethical implications. When morally unaware or disengaged, important principles are left out of their decision-making process. Awareness, however, does not ensure ethicality, but it does change the focus of the decision-making process. The ethical organization, then, will also foster ethical dialogue and inject ethical concerns into the routine activities of public servants. This may bolster their awareness and encourage them to regularly evaluate their moral and professional obligations.

To lead the ethical organization, the critical design task for public sector leaders involves striking an appropriate balance between cultivating internal controls and relying on external controls to support ethical conduct (Cooper 2012). Internal controls are a reflection of the moral or ethical development of individuals, whereas external controls (e.g., rules, regulations, and codes of ethics) are intended to make public sector

organizations less reliant on such development. To strike an appropriate balance, as argued by Cooper (2012), leaders must understand and incorporate four key elements into the design of their organizational environments: individual attributes, organizational structure, organizational culture, and societal expectations. As the foundation for reviewing each of these design elements, this chapter begins with an outline of several ethical decision-making models or approaches to ethics.

## Ethical (Unethical) Decision-Making

To improve the study and understanding of ethical behavior, a number of ethical decision-making models have been developed. The various models can be grouped into two broad approaches to ethics: normative (prescriptive) and behavioral (descriptive). The former works backward from the principles that ought to govern the ethicality of a decision to prescribe strategies or methods for weighing alternative courses of action, which are thought to increase the likelihood of an ethical result (Cooper 2012; Svara 2007). The latter is more of a descriptive effort aimed at explaining the processes that produce actual decisions, whether ethical or unethical. Normative approaches, then, tend to focus on improvements in the internal, dispositional qualities of the decision-maker. This includes improvements in their moral reasoning abilities, often emphasizing the use of various philosophical lenses to make decisions (e.g., deontology vs. utilitarianism), and the refinement of their character or moral development. Behavioral approaches tend to focus on the interplay between the internal, dispositional qualities of the decision-maker and external, situational factors to generate an improved understanding of how and why ethical and unethical decisions are actually made (Wittmer 2005). The former proceeds from an assumption of rationality, while the latter does not.

Behavioral ethicists have found ample empirical evidence that ethical and unethical decision-making processes are often less rational and deliberate than assumed (Palazzo et al. 2012). Most human decision-making, which Kahneman (2011) labels System 1, is unconscious, intuitive, and, often, emotionally driven. This means that public servants of high character, even if they are skilled at moral reasoning, may rarely access those qualities or engage the cognitive parts of their brain (System 2). It would be a mistake, then, for leaders to take a strictly normative approach and design their organizational environments from an assumption of rationality. Rational decision-making includes the full gathering of information and the weighing of alternative options against some standard to reach an optimal decision. Humans, however, tend to "satisfice" because their rationality, as argued by Simon (1983, p. 34), "is very limited, very much bounded by the situation and by human computational powers." These limitations may bound the awareness of a decision-maker and prevent them from seeing or accessing important information during the decision-making process, thereby constraining or complicating normative considerations (Chugh and Bazerman 2007). This bounded awareness can lead to ethical judgements that the decision-maker cannot defend, often referred to as moral dumbfounding. This is because they have unknowingly or unconsciously violated the principles of right or wrong that ought to govern their conduct.

Despite the inherent value in developing public servants who are skilled at moral reasoning and who are of strong character, behavioral ethics research suggests that individuals rarely deliberate or reason like philosophers and that situational factors often dominate their dispositional qualities. When it comes to the design of organizational environments, then, leaders must bridge the gap between normative and behavioral approaches to ethics. Distinguishing between the process that produces a decision (moral or amoral decision-making) and the decision that resulted (ethical or unethical), Tenbrunsel and Smith-Crowe (2008) offer a model that can help leaders bridge this gap. In their model, moral awareness or the recognition that a decision has moral or ethical implications is crucial, but it does not guarantee ethicality.

Instead, it serves as the point of departure from which ethical considerations will or will not be included in the decision-making process that follows. In this model, it is the decision frame or perspective of the decision-maker that filters what is seen and informs their moral awareness.

This notion of framing is a compliment to the concepts of bounded rationality and bounded awareness. Decision frames are developed by individuals as they interact with their environment and try to simplify complex situations to facilitate understanding. As stated by Palazzo et al. (2012, p. 326), this is a sensemaking process that produces frames that "guide how information is processed, controlling what information is attended to and, just as important, what is obscured." A normative frame generates a heightened level of moral awareness, such that a decision-maker will "process and encode incoming information into moral categories" (p. 324). This increases the likelihood that they will weigh the alternative courses of action against the principles that ought to govern the ethicality of a decision. Other frames (e.g., legal, technical, political, or economic), however, do not generate moral awareness, which means that these principles would not be incorporated into their decision-making processes.

The decision-maker can only use or be under the influence of one frame at a time. Yet, a situation or decision can be viewed from multiple frames, which is vital to, but does not ensure, ethical decision-making. Behavioral ethicists, however, have uncovered a number of individual cognitive limitations and situational pressures that contribute to instances of rigid framing, whereby a decision-maker is unable or unlikely to switch from one frame to another. This increases the likelihood of an unethical decision because, when locked into a non-normative frame, they will remain unaware or disengaged from the decision's moral or ethical dimensions. The remainder of this chapter incorporates these factors into its review of what public sector leaders need to know about the four key elements to the design of organizational environment that are supportive of ethical conduct.

## The Key Design Elements

Violations of the "special relationship" that exists between public servants and citizens occur almost daily. Public sector leaders who commit the fundamental attribution error will attribute such failings solely to the disposition of the public servants, while neglecting the potential influence of the situational pressures that are unique to their organizations and environments (Zimbardo 2007). Yet, the dynamic nature of person-situation interactions can produce instances of rigid framing. In these instances, the decision-making process is likely amoral, which means that important principles are either not part of the process or that certain lesser principles have been promoted at their expense. The critical design task, then, is the striking of an appropriate balance between the cultivation of internal controls and the development of external controls that will work together to promote and protect the "special relationship." This requires a bridging of the gap between the normative and behavioral approaches to ethics, which will help ensure that public servants do not make sense of, or frame, their situations too rigidly.

### Individual Attributes

Through administrative discretion, public servants participate in governing. Alongside elected officials, they occupy the ethical space between the foundational principles of the regime (e.g., freedom, equality, due process, and separation of powers) and the particularistic concerns of citizens (Rohr 1989, 1996). This discretion, then, empowers them as moral agents. Here, moral agency includes both the power to refrain from decisions or actions that violate those principles and the power to proactively assist with their advancement. Internal controls, then, should help public servants navigate any tensions that might arise between their instrumental or technical responsibilities and their responsibilities as moral agents. They should help them evaluate their moral and professional obligations and help them make ethically defensible decisions.

Internal controls, then, serve as the normative frame and are the "moral standards" or "self-

sanctions" by which public servants exercise their administrative discretion and moral agency (Bandura 1999). These are deep-seated and can reflect a lifetime of attitudes and beliefs. They are not easily changed. As such, efforts to cultivate internal controls emphasize important attributes that are related to the cognitive and moral development of public servants. These efforts may include trainings and opportunities for public servants to develop and practice their reasoning skills, thereby bolstering their experiential awareness of the types of ethical dilemmas that they may face. Leaders may also cultivate internal controls by promoting the individual and professional virtues or values important to their organizations and that ought to define the character of a public servant.

Despite their importance, internal controls, as argued by Bandura (1999, p. 2), "do not operate invariantly as internal regulators of conduct." They do not come into play unless they are activated. The self-regulation of behavior is not entirely rational. In addition to the possibility that individuals might knowingly choose to do wrong, there are number of cognitive limitations, often referred to as heuristics and biases, which can create ethical blind spots (Bazerman and Moore 2009; Drumwright et al. 2015; Palazzo et al. 2012). These blind spots can derail rationality and unknowingly lead individuals to decisions and behaviors that run counter to important principles and substantially alter the delivery of public services.

First, individuals tend to focus on the things that are readily available and tangible at the expense of the abstract and vague. Thus, they struggle to imagine or deal with the consequences of a decision that are distant in time and space. Second, according to the concept of just-noticeable differences, individuals struggle to recognize the ethical implications of gradual changes in their work environments. This can create a slippery slope in which they gradually become participants in extreme violations of the "special relationship." Third, once individuals have invested time, money, and effort in a decision, it creates a sunk cost that makes it difficult for them to abandon that decision even if it turned out to be wrong. This is often described as the escalation of commitment.

A fourth cognitive limitation includes the tendency for individuals to overestimate their own ethicality. This can cause them to be overconfident and overreliant on their own emotions and intuitions in situations with serious ethical implications. Yet, an individual's view of reality is often subconsciously shaped by self-serving biases that manipulate their decision frames, compartmentalize their thoughts and actions, and conjure up rationalizations to justify their decisions after the fact (Drumwright et al. 2015). The corresponding decisions, then, selectively draw on important principles and values in ways that may unknowingly serve the interests of the individual. The rationalizations help alleviate any psychological tensions or cognitive dissonance that might normally be felt by an individual in conditions of rationality (Johnson 2016).

Framing or limiting what is seen or attended to these cognitive limitations may block or bound the moral awareness of public servants. This diminishes the effectiveness of internal controls. While making public servants aware of these limitation through trainings can help the decision-maker de-bias their judgements (Bazerman and Moore 2009), the attention of a public servant is always situated, that is, placed in an organizational and environmental context that is either supportive of, or complicates, ethical decision-making.

### Organizational Structure

The self-regulation of behavior is not entirely intrapsychic. Situational pressures matter. They may exacerbate cognitive limitations as well as influence how individuals frame or make sense of their situation (Palazzo et al. 2012). Beginning with the pressures at the organizational level, there are several structural arrangements that promote rigid framing. Hierarchical arrangements, for example, tend to discourage questioning and produce an over obedience to authority or what Reed (2014) referred to as "sheeplike" behavior by followers. This can lead to the displacement of responsibility, wherein individuals participate in and justify unethical decisions by arguing that they were simply following orders. Often,

hierarchical arrangements also communicate the notion that individuals at the lower levels of a hierarchy ought to focus on doing the work and leave the thinking to individuals at the higher levels. This can produce a mindless, unquestioning attitude (Morgan 2006). Further, the modern bureaucratic organization tends to break complex problems into manageable chunks and structure their jobs, specialized functions, and subunits around those chunks. This diffuses information and fragments responsibility, which can lead to the problem of distancing. Distancing occurs when an individual no longer can see or feel the full consequences of their decisions or actions. These structural arrangements disconnect the individual from the larger whole, thereby generating a frame that makes everything appear separate and unrelated (Senge 2006). This frame will certainly distort or alter a public servant's evaluation of their moral and ethical obligations.

Organizational structures, however, can be supplemented by external controls that function as safeguards, while supporting ethical decision-making. Sound governance structures will include an "ethics infrastructure" that fosters ethical dialogue and injects ethical concerns into the routine activities of public servants (Jurkiewicz 2015; Reed 2014). In addition to creating channels for dissent, this includes structures to ensure that the principles governing their conduct are clearly communicated and understood as well as rewards and punishments that serve to motivate and induce compliance. These can take a number of forms, but often include codes of ethics, oaths of office, ethics trainings, ethics audits, regulatory oversight, and performance and evaluation processes that serve as accountability mechanisms. Ideally, this infrastructure will operate as a separate entity and include other protections to ensure that individuals can freely communicate their ethical concerns without fear of repercussion.

When necessary, external controls may enforce compliance, but their primary purpose should be to work against rigid framing and, thereby, increase the effectiveness of internal controls. External controls that attempt to replace, rather than inform, administrative discretion and moral agency can lead to lower levels of reasoning, whereby ethicality is almost exclusively assessed in relation to agency rules (Rohr 1989). Agency rules, however, do not define the totality of a public servant's moral and professional obligations. Structural arrangements should protect the ethical autonomy of public servants and empower them with decision-making responsibilities, while ensuring that important principles are promoted and protected in the process.

### Organizational Culture

Culture is a powerful force that influences the decisions and behaviors of individuals in groups and organizations. Sometimes this influence is in direct opposition to the structural arrangements of the organization and complicates ethical decision-making. According to Schein (2010), culture refers to the shared assumptions that are learned by a group as it interacts with, and adapts to, its internal and external context. Those assumptions become so embedded and taken for granted that individuals rarely recognize their influence. Yet, they are shared and mutually reinforced, mostly subconsciously, as the correct way to perceive, think, and feel by visible artifacts, rituals, myths, values, and norms. Cultural forces can develop at various levels of the organization and, because the assumptions are so deeply embedded, they are hard to decipher, understand, and manage.

Scholars have identified several cultural forces and their underlying assumptions that can frame situations in ways that are particularly detrimental to ethical conduct. This includes a culture of technical-rationality (Adams and Balfour 2015), which is built on the assumption that public servants can and should apply abstract principles as objective scientists. Thus, the scientific method is promoted in such a way that it may reduce their sensitivity to important principles and cause them to miss the full implications of their decisions or actions. In a culture of conformity, often characterized by groupthink pressures, public servants are likely driven by a desire to belong or to avoid the perceived negative consequences associated with nonconformity. In addition to these examples, Schein (2010) offers some underlying cultural assumptions that are related to time, space,

human nature, human activity, and human relationships that may also influence framing.

Cultural forces are the product, then, of shared sensemaking and learning. What public sector leaders pay attention to, how they react to situations, the principles they support, model and reward, and the emphasis they place on ethicality will go a long way in shaping the assumptions and cultural framing that influence the decisions and behaviors of public servants. Leaders who understand the dynamics of culture will also manage or attempt to shape the underlying assumptions that surround the structural arrangements of their organization. They must utilize structure and culture to manage meaning and socialization processes (Johnson 2016) in such a way that the "special relationship" is paramount in the minds of public servants and assumed to be a valuable and reliable decision frame. Such a strong, principled culture will require sustained and consistent communication over long periods of time. Yet, as argued by Kurtz (2014), self-sanctioning, or internal controls, and such a strong culture of integrity are compliments to, not replacements for, external controls such as regulatory oversight.

### Societal Expectations

The fourth and final design element, according to Cooper (2012), is the most fundamental because it connects the other elements most explicitly to the "special relationship," thereby promoting democratic values and the primacy of the citizenry. Societal expectations, if taken into account and managed correctly, will help ensure that the other elements work together and reinforce one another in ways that discourage rigid framing. While there are a number of ways that a society communicates its expectations of public sector organizations, two are key to the design of organizational environments that are supportive of ethical conduct: public participation and laws and policies. Interactions with the public create an opportunity for public servants to reevaluate their moral and professional obligations and do so in light of relevant social trends and the public's interests. Leaders can create channels for public access and encourage civic engagement through the use of organizational structures. Laws and policies establish the boundaries or limits of administrative discretion, while linking public servants to the branches of government that are more directly subject to the discipline of the ballot box. Leaders can cultivate internal controls and cultural forces that engender a respect for the law and the sovereignty of the citizenry.

## Conclusion

To design and oversee organizational environments that are supportive of ethical conduct, leaders need to attend to the normative concerns by promoting the principles that ought to define the ethicality of a decision, while preparing for and addressing the behavioral realities of how decisions are made. Those behavioral realities tend to derail rationality and generate rigid framing. The ethical organization, however, manages to overcome those tendencies. It does so because its leaders understand the four key design elements, discussed above, and see to it that they reinforce one another and synergistically protect and promote the "special relationship." Yet, the leader of the ethical organization must realize that their own ethical and moral failures can undermine the entire enterprise.

## Lean in the Public Sector? Try Flexible Professionalism

Roland Zullo
Institute for Research on Labor, Employment and the Economy, University of Michigan, Ann Arbor, MI, USA

Lean operational principles have U.S. lineages: Ford's mass production system (Fujimoto 1999), the just-in-time inventory practices of the U.S. grocery industry (Ohno 1988), and Deming's statistical process improvement techniques (Deming 1982). As a coherent philosophy, however, Lean was born in the post WW II Japanese reconstruction period, where these earlier threads of practice were merged and refined. Lean gained converts worldwide with the success of the Japanese auto industry, most notably Toyota (Imai 1986; Ohno 1988; Womack et al. 1990), and has since migrated to other industries, including public and private nonprofit organizations (Fryer et al. 2007; Radnor and Walley 2008; Suárez-Barraza et al. 2012).

A main objective of Lean is the minimization of operational waste (Shah and Ward 2007; Womack and Jones 1996), making Lean an inviting proposition in an era of governmental fiscal stress. Our purpose is to explore the extent that the Lean philosophy can apply to publicly financed and managed operations. In short, the fit between Lean and public good production is poor, although some aspects of Lean can be transferred. This essay explains the logical discord between Lean and public good production and offers an alternative schema, flexible professionalism, which posits that quality public goods are a function of lateral competency, cross-unit

coordination, and poly-directional professionalism. Such operational objectives are achievable by establishing a stable and skilled workforce.

Our point of departure is the disparate origins of private good and public good demand. Private goods originate from exchanges that are divorced from requirements to be socially inclusive, allowing producers to thrive through strategic exclusion. Public goods arise from political processes which, when democratic, pressure providers to respond to social diversity and community contingency. These added demands require producers of public goods to deviate from standards of efficiency observed in private markets. Consequently, the unit cost reduction aspects of Lean, such as the pull method for achieving continuous and efficient process flow, are less relevant for public good production. Indeed, forceful applications may induce dysfunction.

Flexible professionalism does finds common ground with aspects of Lean that stress customer responsiveness. The central premise is that citizen-derived demand is best met by nurturing "healthy fat" in the form of surplus employee skill for effectively handling citizen diversity and community contingency. Flexible professionalism adheres to the Gestalt notion that "the whole is greater than the sum of its parts" by asserting that organizational performance is highest when the many within the whole are laterally and cooperatively dedicated toward a public mission.

## Literature on Lean and Public Goods

Lean philosophy has as its starting point a quest for an alignment between customer-defined value and product attributes, with practitioners coached to eliminate activities that do not add value for the customer (Womack and Jones 1996). Yet despite the customer-first theme, as a practical matter, tailoring production to satisfy varied customer wants must be balanced against the opposing pressure to compete financially through scale economies (Hines et al. 2004). Arguably, unit cost reduction via waste elimination is Lean's main appeal (Monden 2012).

In execution, Lean is multidimensional where, in private good production, can involve just-in-time inventory, cellular teams, integrated supplier relationships, and periodic quality testing and refinement. A main goal is to achieve a continuous flow of operations by balancing the movement of material across discrete production stages. One method in manufacturing is to incrementally increase assembly line speed in order to expose underperforming stages of production. Once discovered, resources are deployed to upgrade subpar work areas. Tactics for improving the efficiency of a work station can involve ergonomics, rapid die change, teamwork, improved material handling, and so forth and ideally are based on input from line personnel. Enthusiasts for this form of continuous improvement claim both increased system productivity and better working conditions (Womack et al. 1990).

Trials of Lean in the public sector, however, suggest an unnatural fit. Successful cases apparently required significant upfront investment. Survey results by Yasin et al. (2001) mention the need to imbue employees in Lean culture and philosophy, modify facility layout, negotiate new procedures with suppliers, and perform a comprehensive organizational assessment to identify promising applications. Extended negotiations between stakeholders were likewise needed to introduce Lean concepts in a Danish context (Pedersen and Huniche 2011). Even with significant pre-Lean investment, staff acceptance is not guaranteed (Carter et al. 2011).

Suárez-Barraza et al. (2009) report Lean adoption for three town councils in Spain. One council improved the social service and parks and gardens units by cleaning and expanding physical space. A second improved tax collection through employee skill training, which enhanced internal labor market flexibility. A third improved process flow for license authorization, largely by reducing the number of licenses and paperwork requirements. Notable is that none of the councils implemented Lean system-wide; the efforts were limited to specific functions within units. Streamlining occurred where the tasks were routine (e.g., processing paperwork) or involved changes in public policy

(i.e., fewer forms and a reduction in the number of licenses).

Suárez-Barraza and Ramis-Pujol (2010) describe a case study of a Mexican bureau that consulted with other Mexican agencies on matters dealing with staffing, human resources, and labor relations. To implement Lean, a virtual production line was established to process staff recruitment applications. Process time declined significantly, waste was reduced, and customer satisfaction improved. Although Suárez-Barraza and Ramis-Pujol (2010) fall short of mentioning limitations, it does appear that Lean was used only for a comparably low technical and routine consultative activity.

Indeed, examples of where Lean practice extends to core public functions are scarce. In a case of a public health organization, Smith et al. (2012) find some success in applying Lean to client visit scheduling, which in turn freed nursing hours for other activities. Lean was never attempted in the more central role of ministering nursing care. Similarly, Ng et al. (2010) attribute gains in client satisfaction to an application of Lean in a Canadian hospital emergency room, but results were achieved by reducing wait times rather than improving care quality. In their analysis of a public purchasing department, Waterman and McCue (2012) offer that one barrier to Lean in government is the nonstandard duties that are involved in producing public goods. More generally, activities that inherently rely on professional judgment are poor candidates for Lean (Roffe 1998).

On a related theme, Scorsone (2008) reports on an application of Lean for a government purchasing department and observes that one confounding factor for Lean implementation is the responsibility to administer public law. Performance goals in the public sector are diffuse precisely because public organizations have missions that defy time-based metrics for efficiency. Government waste, or "muda," can often be traced to due processes and other public safeguards embedded within democratic institutions.

A summary of the attempts to implement Lean in health-care organizations by Radnor et al. (2012) echo the foregoing challenges, adding that defining customer value is harder when customers are citizens, and where because of information asymmetries citizens look to the provider to define value. Radnor and Osborne (2013) and Osborne et al. (2013) have rejected the Lean approach to public services altogether and have called for a theory specific to public operations. The gist of their argument is that Lean evolved from manufacturing, where the labor requirements, capital, and organizational logic do not transfer to government agencies.

One prospective conceptualization is to reverse the emphasis away from flow efficiency and toward citizen-defined value. Lean experiments viewed as successful have focused on customer satisfaction rather than waste reduction (Di Pietro et al. 2013). In discussing an application of TQM to public service, Milakovich (1990) concludes that the way to grow quality is to remove barriers across governmental units, provide training, foster professionalism, and remove numerical metrics as a basis for performance evaluation and reward. The present essay extends this promising lead.

## Private Markets and Public Goods

What is a market? Markets form when enterprises target a subset of customers from the full universe of persons that might need or desire a certain good (Samuelson 1954). Price is the usual mechanism for exclusion, although utilitarian or psychological factors play a role in defining markets. The liberty to exclude segments of society from consideration is a prime dimension in the entrepreneurial hunt for competitive advantage and is ultimately how markets originate. Profit symbolizes the value of an organization's output in relation to a market niche.

Public good demand is instead determined by a political body which must, to some degree, answer to a plebiscite. In a democracy, public good demand is shaped by a community through the election process and other venues, such as open deliberations. As collectively financed goods, elected and administrative officials are obligated to factor in the diverse attributes of a population: rich and poor, elderly and youth, men

and women, immigrant and native, handicapped and able, and so forth, when ruling on the character of a good. Unlike economic markets, where goods are designed to match refined buyer traits (socioeconomic, psychological, and so forth), public goods have inclusive charters with different parameters: population (e.g., children), social function (e.g., education), or political jurisdiction (e.g., school district). Markets are nonexistent, because price ceases to be a mechanism for exclusion. Instead, public good producers are saddled with a mandate to accommodate any disadvantaged constituent that cannot access a comparable good produced through private means.

Producers in market environs are pressured toward operational linearity. The incentive toward linear efficiency is intensified by the fact that investment returns must be coaxed from voluntary private transactions. Success by the organization in meeting customer value is measurable: price and sales data provide feedback signals, per unit expenses and gross margins are quantifiable, and operational adjustments can be made in response to changes in demand or input costs. Once the organization finds a product line, Lean process improvements can kick in, where the operation is decomposed into discrete steps for an efficiency and contribution assessment. Profit accumulation disciplines the system toward unit cost reduction, where employee performance, like products, can be assessed with standard metrics, and rewards can be dispensed to align employee behavior with the goal of meeting market demand.

In the public arena, performance is measured by less definitive metrics pulsating through political channels, such as community approval, effect on population well-being, or perceived fulfillment of a mission. The democratic processes that shape public good demand and the generalized revenue source of involuntary taxation impose a mandate to balance the diverse demands of a constituency within the boundaries of a given budgetary and legal context. Meeting citizen-shaped values require a departure from customer-driven version of efficiency, while the relative low-risk source of tax-generated funding grants providers the latitude to do so. From the lens of Lean, socialized operations are rife with waste: school districts disproportionately assign teachers to special needs pupils; transit systems accommodate handicapped riders at a cost greater than for the unimpaired; solid waste collection units deviate from routine curbside pickup to perform walk-up services for the elderly; and so forth. Such failures to conform to Lean's flow optimization objectives are, however, precisely the markers for success in meeting an inclusive, social mission.

Differences in the origins of demand trickle down to the "shop floor" activities of personnel. Locating and mining private markets require creativity and ingenuity. Yet in most contexts, advanced discretionary judgment is reserved for positions involved in securing a competitive advantage, such as product development or corporate strategy. Nearly all personnel outside of corporate headquarters or engineering are assigned a role in efficiently supplying product. Non-managerial ingenuity might be tapped to improve station efficiency or product quality, but opportunities for substantive influence beyond this scope are rare, if not a manipulative ruse (Babson 1993; Lewchuk and Robertson 1997). Work for the majority of persons in the private world consists of sequential and routine tasks that are channeled toward optimizing financial metrics.

In contrast, the salient character of public work is routine tasks punctuated by varied demands from a diverse community with democratic rights. Quality is judged less by the standardization of output than by provider sensitivity to citizen diversity and response to community contingency (e.g., snowstorms, water main breaks, power outages, terrorist attacks, and so forth). Moreover, citizens relate to performance factors that are hard to monetize, such as equity and justice, and claims for good access are ubiquitous. These features affect expectations of good delivery and perceptions of quality. So, for example, rather than enforce a ridged code, law enforcement should consider mitigating circumstances behind people's actions; instead of drilling students for standardized tests, K-12 districts should challenge students to think critically, solve problems, and exercise creativity. Any linear and formulaic

application of law, policy, or craft can result in output that violates citizen-derived values.

## Organizational Logic of Public Goods Production

Public goods production has three operational requisites that are weak to nonexistent for organizations supplying private markets. First, workers delivering public goods are tasked with a range of unconventional and non-routine responsibilities. Law enforcement officers handle crime incidents but also lecture children on public safety; school custodians will set the broom aside to protect a bullied child; parks employees locate lost hikers; and so forth. Quite unlike the linear efficiency goal of Lean, public goods production calls for lateral competency to meet the varied expectations of a diverse constituency. Value is found in effective responses to contingent events and the personal attention given to extenuating circumstances.

An overlapping operational requisite is integrated response capacity, defined as occasions when employees from one functional unit are asked to assist another functional unit to handle a pressing community need. Integrated response is common practice for smaller municipalities. For example, to effectively clear snowbound roads, sanitation workers at many municipalities assist streets departments by taking shifts driving plows during snowstorms. Familiarity with the street layout and a commercial driver's license qualifies sanitation workers for this role. Similarly, persons from the streets department will assist water department employees with excavation, material transportation, or traffic control when a water main ruptures. Integrated response capacity is an efficient method of marshaling skill and effort across multiple functional units to handle emergencies or non-routine situations.

The importance of integrated response capacity relates to the weight of the social mission and insularity of the responsible agency. Schools, hospitals, and law enforcement agencies typically display a high degree of integrated response capacity. The mission of public schools to advance the intellectual, physical, and civic development of children requires actors within the school community to collaborate, often in small ways, toward this goal. The need for integrated response capacity is especially strong where security and public safety are priorities. In prisons, where custody and security are paramount, employees in ancillary units, such as health care or food service, are trained to respond to emergencies involving prisoners, including backing up corrections officers. Integrated response capacity is perhaps most critical when human survival is at risk, such as in the case of military missions.

Third, public production involves situations where there are no scripted courses of action; where problem uniqueness requires polydirectional thinking, and ultimately the quality of a good depends on professional judgment. Teacher performance turns on how well teachers assess and respond to the unique needs of each child. Imposing incentive driven constraints on the profession have failed because they press teachers to suspend best practice and treat students, via standardized test scores, like a commodity. In general, the "performance-based" mechanisms that have come to permeate government (OFPP et al. 1998) tempt professionals to disregard client uniqueness.

For many professional occupations, performance is optimized by shielding employees from pressure to conform to economic incentives that are commonly found at the individual or organizational level in private economic markets. Predictable forms of moral hazards arise when teachers are rewarded based on the performance of children on standardized tests, or when police officers receive bonuses for making arrests, and so forth. Disabling rewards that channel employee decisions toward financial metrics frees professionals to act in accordance with socially defined, nonlinear objectives for output quality and integrity.

Incentive neutral environments are especially important for occupations that administer public law or concern vulnerable populations due to power imbalances and information asymmetries. Moral hazards caused by perverse incentives might pose little harm for services

like garbage collection, because unhappy home owners have sufficient political status, less so for children, the destitute, the elderly, the handicapped, persons confined to institutions, and so forth. One advantage to socialized good production is that a governing authority gains full control to structure a compensation plan that eliminates economic incentives to act in ways that are contrary to a social mission.

## Flexible Professionalism: An Alternative to Lean

Flexible professionalism is the capacity to deploy talent within and across agency units for the purpose of meeting citizen-defined value. Unlike Lean's attention toward linear efficiency, flexible professionalism pushes the boundaries of worker ability and capacity laterally. Rather than conceptualize the production system as a series of work stations meant to yield defined output, system components are integrated and coordinated to satisfy citizen and community derived demand. Finally, with flexible professionalism improving workstation efficiency is less important than nurturing poly-directional professional judgment.

Flexible professionalism is usually an organic creation borne of necessity rather than a programmatic approach to public good production and can be regularly observed in small municipalities where functional units have few staff, relations between units are informal, and collective responses to community issues are common. Smallness dictates and enables flexible professionalism. Fewer staff requires employees to wear multiple hats, which develops lateral competency. Manpower to handle anomalous or emergency situations require participation from multiple units. At the same time, the informal relations across persons and departments allows for the rapid deployment of labor to handle non-routine events. Finally, smallness eases the job of a central authority to coordinate and delegate tasks across departments or units.

Figure 1 provides a Venn diagram to illustrate the concept. The three circles with solid lines are functional units administered by a single public authority. Conceptually, the circles might represent the water, parks, and street departments of a municipality or perhaps the teaching, custodial, and transit functions of a school district.

Each functional unit has a set of core duties symbolized by circles with dashed lines, $\mu$, as well as non-routine obligations that fall outside of the core duties, $\sigma$. Note that the functions are integrated and mutually supportive, as shown by the areas where the larger circles overlap.

Flexible professionalism begins by distinguishing between core, $\mu$, and non-routine, $\sigma$, tasks. Core tasks are defined as are the duties necessary to complete the function mission and serve a population under ordinary circumstances. With refuse collection, for example, core tasks are the daily routes for the pickup and disposal of garbage, recycling, and compostable waste. With school custodial services, core tasks are the cleaning and maintenance schedules. Flexible professionalism begins by staffing a system with enough direct labor to proficiently provide the good as if non-routine demands did not exist.

To the extent that the waste minimization aspect of Lean applies to public good production, it does so within $\mu$. Modernized garbage trucks or improved routing might reduce the time required for garbage pickup; better cleaning supplies or machinery might improve the efficiency of school building maintenance; and so forth. For some functional units, the opportunity to trim waste will be greater than with others. As the literature has shown, professions such as teaching and nursing that must contend with client uniqueness are adverse to Lean streamlining. For professional roles, Lean process efficiency gains make sense only at the margins for administrative tasks.

Key: $\mu$ = core tasks; $\sigma$ = non-routine tasks

Instead of linear efficiency, skill development is emphasized. One hallmark of a system with a high degree of flexible professionalism is a workforce with skills that extend beyond core duties. Surplus skill enables workers to handle or assist with the value-added demands for good output by raising awareness of citizen diversity and the range of proper responses. In Fig. 1, the full range of work performed by personnel in a unit extends beyond the core, designated by $\sigma$. While the efficiency

**Lean in the Public Sector? Try Flexible Professionalism, Fig. 1** Flexible professionalism

aspects of Lean might apply within μ, the customer responsiveness aspect of Lean is about effectively handling deviations from the core, σ. Skill training is meant to maximize σ within budget constraints. Knowledge diffusion can be systematically nurtured with a training program that encourages the transfer of experiential knowledge among direct labor. Structured like an apprenticeship, with senior paired with junior or skilled with the less skilled, training plans can be initiated by management or incorporated within a labor agreement if the workforce is unionized.

Overlapping areas in Fig. 1 are where the agency engages in cross-training so that persons in one unit can assist with a non-routine situation in another unit. Examples will help illustrate the concept. Many municipal workers spend time outdoors: refuse collectors, parks and street employees, transit workers, and so forth. Neighborhood knowledge and contacts with community members place them in a position to witness and report on matters that might affect public safety, such as criminal activity or medical emergencies. Municipal workers can be trained to spot, report, and assist in situations that would otherwise be considered the purview of a public safety or ambulance unit. The supporting units do not replace the professionals trained to handle crime and health emergencies; rather, the objective is to augment the capacity of these units to carry out their mission.

Again, this form of integrated response is established practice in many smaller municipalities. When emergency situations occur, municipalities will deploy necessary labor to address the situation. Citizens' benefit from this coordinated delivery model through a rapid problem resolution and minimal service downtime. The overlapping areas in Fig. 1 are not limited to emergencies. Cultural or civic events that attract spectators (e.g., parades, festivals, concerts) require personnel for crowd control, security, setup, and post-event cleanup. Teams of municipal workers can apply their skill and effort toward these value-added community activities. The practice can be systematically developed by anticipating emergency and non-routine events, identifying proximate personnel support (i.e., where units spatially overlap and skill sets can collude), and then implementing a cross-training program to grow capacity. Aside from training, integrated response is enabled when workers are under the same coordinating administration. The liberal deployment of manpower is impaired when units function as operational silos because a labor force answers to multiple employers.

What flexible professionalism achieves is the maximal use of system talent for the public good. Trust in the judgment of a well-trained workforce is the underlying managerial mindset. And to motivate judgment on behalf of citizens and community, competing motivational pressures in the workplace need to be addressed. Rewards that stoke competition among personnel, such as merit pay, should be disabled to encourage cooperation. Compensation systems that feature relatively compressed pay are favored over pay systems with large disparity. Deeds committed on behalf of community should be recognized and deviations from rule or policy tolerated as long as intent was driven by the public good.

Compensation typically correlates with worker qualifications, and thus surplus skill carries a price. Further, the investment in skill establishes incentives to minimize employee turnover and establish a stable team of direct staff. One potential offset to higher direct labor costs are reductions in administrative costs related to direct oversight. What allow management to reduce indirect expenses are the maturity, skill level, and stability of the direct staff. In this regard, a useful metric is the span of control or the ratio of supervisors to direct service personnel. The systematic paring of administrative overhead can accompany flexible professionalism development.

## Concluding Conditions for Flexible Professionalism

Lean involves balancing customer demands for valued product attributes against pressures to standardize production to achieve cost efficiency. Flexible professionalism involves balancing the demands of a diverse citizenry against the constraints of a public budget and law. Both ideas have as their point of origin the end users of the good, where the two diverge is in the operational methodology. Lean improves linear efficiency by squeezing non-value-added waste from the production system. Flexible professionalism emphasizes skill development and inter-unit cooperation to develop lateral competency, contingency responsiveness, and poly-directional judgment. This final section outlines the preconditions for developing flexible professionalism.

1. Democracy. Unlike the private sector, where demand can be assessed through market share, sales data, profits, and so forth, public good demand is determined through democratic institutions. Fair elections, open meetings (and public posting of recorded sessions), freedom of information rights, and channels for citizen input (e.g., surveys) are necessary to receive and gauge citizen feedback. Strengthening democratic practice and creating avenues for citizen voice enables an understanding of citizen-derived demand.
2. Central authority. Central administrations unify planning and communication and are positioned to resolve inter-unit disagreement. Centralized authorities need the capacity to coordinate a response to a non-routine task or event as well as the power to flexibly deploy labor. A decentralized administrative structure, where functional units take on the character of fiefdoms, impedes cooperation across units.
3. Discretionary budgeting. Budgetary models that punish functional units for establishing training programs or the lending of capacity to another unit will discourage flexible professionalism. The accounting and budget system must finance skill development and inter-unit cooperation. Resources will be required, for instance, to cover the cost of overtime when manpower is lent to handle a pressing community concern. Eliminating disincentives to grow and share human resources is critical for flexible professionalism.
4. Job security. As argued, skill development is core to flexible professionalism. The mechanisms for transferring skill throughout the direct the labor force require senior employees that are willing to share experiential knowledge with junior employees. One behavioral constraint is the fear by senior workers that once knowledge is divulged they will be replaced by lower-paid, junior coworkers.

Sufficient job security protections are therefore needed to gain the cooperation of senior staff.

5. Equitable compensation. Large variation in compensation is characteristic of command and control organizations where a few dictate and the many obey. Equitable compensation instead acknowledges team responsibility by recognizing the contributions of individuals throughout the hierarchy. Organizations that aim to foster cooperation and shared effort have more compressed compensation plans. Payment schemes that tend to induce negative forms of competition, such as merit pay, are discouraged.

Barriers to implementing flexible professionalism are created by the divergent interests within an organization. Status and hierarchy norms across occupations may impede worker cooperation. Large municipal departments that develop independent political power can prevent or minimize inter-organizational collaboration. Labor unions can assert jurisdictional rights around their occupations and prevent collaboration. To effectuate flexible professionalism, public management must identify and address such barriers between workers, groups of workers, and administrative units.

# Learning Bureaucracy

Geunpil Ryu
Leadership Development Group, POSCO Group University, Incheon, South Korea

## Synonyms

Learning organization; Organizational learning

## Definitions

A *learning bureaucracy* refers to continuous efforts by the government to enhance government performance through systematic learning endeavors.

## Introduction

A *learning organization* refers to an organization that encourages and facilitates learning in order to continually transform itself to enhance its capability (Senge 1990). It also can be generally defined as an organization skilled at creating, acquiring, and transferring knowledge (Garvin et al. 2008). Importantly, "learning organization" can be distinguished from "organizational learning" because organizational learning refers to a system-level entity of learning, while a learning bureaucracy refers to the process of learning within organizations (Fenwick and McMillan 2005). To sum up, a *learning bureaucracy* refers to continuous efforts by the government to enhance government performance through systematic learning endeavors.

In single-loop learning, which is common in continuous improvement programs, employees learn how to identify and correct problems. In contrast, double-loop learning involves a fundamental shift in the way employees learn because employees must change the core values and basic assumptions related to how they work (Argyris 1993). Thus, single-loop learning occurs when a public employee successfully solves his or her job-related problem. Double-loop learning occurs when the employee changes behaviors and attitudes based on what he or she has learned.

## Why Is a Learning Bureaucracy?

Innovation is considered a competence that allows individuals to deal with the complexity of the operating environment of today. A learning bureaucracy is a strong source of innovation since it focuses on solving organizational problems whose solutions often require innovative efforts. Suppose, for instance, that a public agency wants to enhance its service quality for citizens. Public officials in the organization may interview the citizenry, focusing on their problems or claims about services they have received, and then through a collective group thinking process, the organization finally arrives at an innovative idea to solve the

problems. In addition, public employees' efforts in implementing the innovation may positively affect government performance.

Further, learning strengthens individuals' cognitive skills since it allows them to see the content and structural form of something new and formulate a new knowledge structure based on previous knowledge. Accordingly, a learning organization can derive better decisions from the process undergone during trial-and-error learning (Senge 1990). For instance, suppose that a public employee has learned important lessons from his or her wrong decision. He or she may analyze the decision in terms of what led to the wrong decision. The public organization may request that he or she teach the lessons learned through the analysis process to prevent other employees from making similar wrong decisions.

Third, collaboration is all about learning together and from each other (Argyris 1993). A learning organization's projects are created by a group of chosen experts on the topic and are intended to strengthen collaboration and communication between members and with other professionals participating in these projects. Likewise, team-based learning encourages individuals to engage in developing communication and other interpersonal skills, which creates a kind of institutionalized learning or organizational capability. For example, while joining an organizational project, group members may initially share their ideas to identify what they feel are the fundamental problems of the project, and in the process, conflicts may emerge based on each individual member's thinking style. Eventually, through the group's interactions, they may learn the necessary communication skills to deliver their ideas without annoying other members. Importantly, they may learn the value of collaborating with team members to solve organizational problems.

## How to Build a Learning Bureaucracy?

According to Senge (1990), a learning bureaucracy organization has five components: (1) systems thinking, (2) personal mastery, (3) mental model, (4) shared vision, and (5) team learning. *Systems thinking* is a conceptual framework that treats the organization as a complex system. *Personal mastery* implies gaining job proficiency. *Mental model* means assumptions or images about how one understands the world. Building a *shared vision* emphasizes the importance of creating a genuine organizational vison – a picture of the future. *Team learning* is a state wherein team members think together to achieve common goals (Senge 1990). In a similar vein, Watkins and Marsick (1993) suggested six imperatives for a learning bureaucracy organization: (1) empowering people toward a collective vision, (2) promoting inquiry and dialogue, (3) encouraging collaboration and team learning, (4) creating continuous learning opportunities, (5) connecting the organization to the environment, and (6) establishing systems to capture and share learning.

This entry proposes four important actions for a learning bureaucracy. First, at the individual level, providing incentives to share public employees' job-related knowledge is important since shared knowledge could lead to another creative idea for public organizations. Second, at the team level, using effective learning tools such as communities of practice and action learning are suggested for learning organizations. Third, supervisors and managers who lead groups, teams, or departments should have developmental leadership training to facilitate public employees' motivation for learning. Fourth, creating a learning culture open to various and different ideas at the organizational level is recommended.

### Providing Incentives for Knowledge Sharing

A *knowledge management system* (KMS) can be defined as an innovative management tool for creating new knowledge by sharing job-related knowledge through IT systems that results in enhancing performance or efficiency (Inkpen 2000). If job-related knowledge can be shared and managed within an organization effectively, then the efficiency within the organization will greatly increase. For example, suppose that a

group of members are working on a project to improve service quality for public citizens. If they had a well-documented service process, they could save time and money and ensure the success of the project.

The success of KMS initiatives depends upon public employees' motivation and their willingness to share and use the knowledge of others (Inkpen 2000). Incentives can be offered to help improve knowledge sharing within an organization. There are many incentive systems that aid in knowledge sharing. In some public organizations, recognition in annual employee conferences is enough to encourage employees to share information. In other organizations, a formal structure of a reward system is applied. Public employees are encouraged to share information by rewarding them financially when they reach a certain knowledge quota. In addition, employees can be encouraged to share what they know if the KMS that they are involved in is easily accessible.

### Using Effective Learning Tools

For a learning bureaucracy, effective learning tools such as *communities of practice* (CoPs) and *action learning* are recommended. First, CoPs are groups of people who share a concern or a passion for something they do and who learn how to do it better as they interact regularly in order to solve organizational problems. Importantly, Lave and Wenger (1991), in rejecting the knowledge transfer model (which isolates knowledge from practice), developed a view of learning known as *social construction*, which means putting knowledge into the organizational context. Problem-solving CoPs can enjoy three benefits: (1) solving organizational problems, (2) enhancing cooperation among the participants, and (3) sharing tacit knowledge (Lave and Wenger 1991). Moreover, CoP theorists and practitioners emphasize a group composition made up of participants with varied backgrounds for learning organization, which leads to both creative ideas and learning about each other while ideas are exchanged. *Situational* learning occurs since CoPs focus on real problems facing public organizations. Finally, all CoP members should have reflection time to share their experiences with the participants, focusing on what they learned in the day's meeting or the whole project process (Lave and Wenger 1991).

Second, *action* learning is an experiential learning method in which participants learn by doing and then reflect on what they have done (Revans 1982). Like CoPs, action learning also emphasizes collective and situational learning by solving real organizational problems and by incorporating a reflection time to share experiences and knowledge. However, action learning further emphasizes the importance of employing a facilitator or learning coach who can ask appropriate questions of the group in order to facilitate their learning experience (Revans 1982).

### Developing Leadership to Enhance Learning

Organizational learning is strongly influenced by the behavior of leaders. When leaders actively question and listen to their followers, the followers feel encouraged to learn. For a learning bureaucracy, Senge (1990) placed great emphasis on the three roles of the leader in the creation of this learning organization. First, as a *designer*, a leader should create a common vision with shared values and purpose. Second, in the role of *teacher*, the leader is seen as a coach who works with the mental models present in the organization. The third role, that of the leader as *steward*, is more vaguely defined and refers largely to the nurturing attitude of the leader (Senge 1990).

### Creating a Learning Culture

*Organizational culture* refers to basic assumptions and beliefs shared by members of an organization (Schein 1985). To instill a learning bureaucracy, public organizations need to build a learning culture. Creating a learning culture built by leaders and other key people who learn from

their experiences influences the learning of others and creates an environment of expectations that shapes and supports desired results. Cultivating a learning culture may be a fundamental change for an organization, requiring a combination of strategies to encourage and enhance public employees' competencies and abilities (Marsick and Watkins 2003).

In order to create a learning culture in public organizations, Garvin et al. (2008) identified three vital components: psychological safety, an appreciation of differences, and openness to new ideas. In regard to psychological safety, public employees must feel confident they will not be marginalized when disagreeing with others in the workplace, asking simple questions, acknowledging mistakes, or voicing a minority viewpoint. They must instead feel comfortable expressing their opinions about work-related issues. Next, organizations should foster an appreciation of differences, which occurs when people realize the benefit of learning from opposing ideas. Recognizing the value of different outlooks can promote energy, motivation, and innovative thinking and decrease exhaustion and lack of focus. Finally, in a learning culture, employees should know that learning is not simply about correcting mistakes and solving problems; it is also about being open to new ideas and developing innovative approaches. Employees should be encouraged to take risks and feel empowered to discover the unproven and unknown (Garvin et al. 2008).

## Conclusions

The current entry addresses the issue of how to build a learning bureaucracy. Four important activities are recommended: (1) provide incentives for knowledge sharing; (2) use effective learning tools; (3) develop leadership to enhance learning; and (4) create a learning culture. First, public organizations should provide extrinsic and intrinsic incentives to share their job-related knowledge to their employees, and if possible, the use of KMSs are suggested in order to effectively and efficiently impart that knowledge. Second, concrete and effective learning tools such as CoPs and action learning are suggested since the tools are effective in helping members learn from each other because they allow participants to share ideas and reflect on what is learned. Third, effective leaders are also important when creating a learning bureaucracy because they serve an important role in initiating and facilitating their followers' learning and because they act as coaches for career development. Finally, an appropriate learning culture must be cultivated in which members freely share knowledge and ideas with each other, and this culture must be sustained by psychological safety, an appreciation of differences, and an openness to new ideas.

## Synonyms

Collaborative learning; Learning as a competitive advantage; Team learning

## Definition

Organizational learning is a process that addresses how organizations create, retain, and transfer knowledge. Often organizations that are substantially similar seek knowledge from each other. In the public sector, though this presents challenges since these organizations typically compete for similar resources, e.g., learning as a means of gaining a competitive advantage create potential costs for public organizations.

## Introduction

Organizational learning has received renewed attention in public organizations over the past 10 years. Although the literature has been complimentary of the role learning has in organizations and has pointed out the benefits of being a learning organization, a number of threats have also been identified. For example, Visser and Togt (Visser and Van der Togt 2016) point out that the relationship between political authorities and public service organizations moderates the effectiveness and value of learning in public sector organizations. For this reason, they suggest that public sector organizations should be given room to learn from each other's problems. In a similar vein Krause and Woods (2012) and Hollibaugh (Hollibaugh 2016) identify threats resulting political conflicts over organizational missions and the political goals for an organization. Additionally, Denhardt and Denhardt (2015) and Osborne et al. (2015) identify threats from mission creep and the competing measures for public service provision (equity versus efficiency, market-based mechanisms versus accountability, and so on).

There is a potentially thornier problem for organizational learning in the public sector given fixed budget allocations. There is pressure from the public for greater innovation (Osborne and Brown 2011) and many of these problems cannot be solved by standard solutions or through increased spending (Hartley et al. 2013). There is an incentive therefore to collaborate and learn in order to address the problems. Organizations that learn from each other are more likely than not to have similar missions – broadly defined such as a Department of Corrections and a Department of Parole both having broad missions of public safety but different individual missions. The higher levels of interorganizational connections make learning between similarly situated organizations more likely, but these organizations are also competing for funds from similar sources (Salamon 1999). This implies that there are points of diminishing returns for learning on organizations, particularly public organizations. Further it implies that if an organization chooses to use its resources for learning in an attempt to gain an advantage (reputation, scope of authority, etc.), then the long-term efficiencies gained must be at least equal to the costs of learning or else learning becomes costly to an organization.

Levitt and March (1988) and Herriott et al. (Herriott et al. 1985) describe learning organizations as having problems overcoming strong commitments, the competencies they have relied on, and thus missing environmental or technical changes to their own peril, i.e., a competency trap. This manuscript argues when organizations learn they may indeed avoid competency traps, but they must also be wary not to take on too many new goals or activities less they sacrifice the

activities for which they are best suited. In other words, organizational learning can reach a point of diminishing returns. To make this case, this manuscript proposes a general equilibrium model of organizational learning to examine the types of goals public organizations pursue.

Public administration scholars tend to make assumptions about organizational learning in order to make broader points about increasing policy knowledge within organizations. For example, Head and Alford (2015) fully acknowledge the role of learning in tackling the policy challenges associated with increasingly pluralist societies, but they do not detail how that learning takes place (Admittedly their intent was to raise the issue of "wicked problems" rather than to address learning as a whole.) (see also Inazu 2017). Private sector archetypes of learning have been used as models of organizational learning in public organizations, e.g., Rashman et al. (2009) lament that the public sector continues to rely on the private sector for empirical validation of the learning principles which it then adopts. Application of many private sector learning theories to public organizations and leadership teams has not been as productive as in the private sector (Jos and Tompkins 2009; Dekker and Hansen 2004; Greiling and Halachmi 2013). Partial explanations for this are found in the strategies public sector managers take in protecting their scare budgetary resources. Public sector managers tend to take defensive strategies when responding to threats in their organizational environment (Rauh 2015; Hamilton et al. 2016); this is in part because they are working on a fixed budgetary allocation requiring additional bargaining over goals, e.g., getting it wrong is likely to have higher costs relative to the budget in a public organization. This is as compared to private sector budgets that tend to be the product of more analytical approaches (Nutt 2005).

In general this paints a picture of public sector organizations as places of bargaining over specific objectives and the means/finances of reaching those objectives (Tosey et al. 2012; Boyne and Walker 2004). At the same time, there are broader endgames such as building good reputation and being seen as the organization to turn to on specific issues (Carpenter 2001; Carpenter and Krause 2015). There is a conflict and an implicit argument here that because public organizations bargain over incomplete and shifting objectives while having a relatively finite set of resources, when learning occurs, its benefits may satisfy short terms concerns while imposing long-term costs. Additionally, there is a potential blind-spot for organizations that seek to learn from substantially similar organizations in order to gain a competitive advantage. They tend to compete for similar funds. This means that if they attempt to assume the activities of their similar counterparts as means of gaining a competitive advantage, the efficiencies gained must be at least equal to the learning costs. If they are not, then the result is a reduced allocation to every other activity the organization pursues.

The purpose of this manuscript then is to establish that when (public) organizational learning occurs with an eye towards temporary objectives (that may not align with broader goals), then such pursuits may be costly to public organizations. Moreover, because of the bargaining nature of public organizations' budgets and objectives (bargaining with political officials over what objectives should be met for example), learning that seems beneficial can actually impose long-term costs. This manuscript proceeds with a discussion of the literature on learning in public organizations followed by a general equilibrium model of organizational learning detailing the costs and benefits of learning and a vignette applying the model. This is followed by discussions and conclusions. Note that this manuscript confines its analysis to organizations with similar broad missions. While the cost dimensions may still exist for cross-sector collaborations, i.e., learning benefits must be at least equal to their cost, there are different incentives for cross-sectoral collaboration than for collaboration between similarly situated agencies including diversifying funding sources (Tulder et al. 2016).

## Learning in Public Organizations

Learning is a relationship characterized by changing knowledge and changing actions (see Rein and Schon 1991; Visser and Van der Togt 2016). In other words, if $X$ is desired in situation $Y$ under conditions $c_1, c_2, \ldots, c_n$ then the preferred course is $Z$. While Visser and Van der Togt (2016) do a good job of opening up these assumptions and detailing the learning models associated with the above tautology, this does not get at the question of *should* one desire $X$? Often time this is not a question that an organization's leaders have the luxury of addressing because the desired goal or policy objective is mandated from political authorities. Other times these goals are broad and it is the method of achieving them that is at question (Arnold 1990).

Bohte and Meier (2000) reiterate that the normative portion of this question is often addressed in terms of output measures. In other words when outputs are measured in numerical terms, then organizations are incentivized to pursue the measure as opposed to the broader social outcome associated with it. One can take it as a given that such goal displacement exists given that public organizations are still largely evaluated on output measures: test scores for schools, recidivism rates for parole boards, response times for police, etc. The context in which learning can be costly is then tied to both the issue of goal displacement that is accompanied by broader effects since the attaining the softer output measures becomes more difficult when policy prescriptions are based on changes in outputs.

There are reputational incentives for pursuing such outcomes though and these may come without an eye to broader costs. Often times taking on new tasks and providing outcomes that "sound good" or even those that empirically show a benefit are used as selling points to enhance the reputation of one's agency (Waeraas and Maor 2015; Maor 2015). Pursuing such ends can be appealing for agency managers who seek to retain confidence of political principals by differentiating themselves from substantially similar agencies (Carpenter 2001). This obviously poses another potential cost for an agency as well as a potential benefit. Different administrations of and changing control of legislative committees suggest political principals vary on how agreeable they are to an agency expanding its authority. This also means that while one set of political principals may be more apt to accept agency outcomes that "look good," another set of political principals may wish for more explicitly beneficial provision of services. If the former is the goal of learning though it may produce short-term gains for an agency while subjecting it to long-term costs. This is likely more true today given the retrenchment of many agencies and the corresponding need to seek funds outside the traditional channels of government (Cox et al. 2016).

Organizational goals whether mandated, functions of a measurable outcome, or matters of satisfying the public interest all include judgments about objectives. Therefore, the objectives encompass a strategic element – how an agency goes about carrying out activities they believe move it towards attaining these objectives (Rainey and Steinbauer 1999; Jung 2014; Jung and Lee 2013). Because of the broad nature of the public mission, there may be multiple goals and therefore multiple objectives available (Moxham 2013). In public safety, for example, incarceration, monitoring, retraining, etc., are all things that can be classified as goals for an agency or for separate agencies. This does not mean that randomly choosing among these goals will result in the accomplishing the public mission of public safety, there must be a strategic choice of which goals are more valuable and which strategies will be used to achieve them followed by training and learning within the organization on how to incorporate these strategies. Because organizations' missions tend to be specialized, the goals must be attenuated to that specialization (West 1984), otherwise an agency may move outside its realm of expertise. Learning within this context of trying to achieve the organization's goal is the primary driver then, more-so than things such as having a learning culture which has been shown to have a mediating rather than a direct effect on organizational outcomes. For example, Song and

Kolb (2013) found that a learning culture had an indirect effect on an organizational financial performance and was mediated by knowledge creation.

Understanding how an organization's goals relate to its mission, and how the organizational mission relates to the broader public mission are necessities for understandings the capacity and limits for organizational learning (Goh 1998). At the same time, learning within an organization is a collective activity (Merriam et al. 2007). Individuals rely on new information, past experiences, and current conditions to evaluate the value of learned facts and how to apply them (Song and Kolb 2013; Song et al. 2012), for example, they could occur individually or collectively depending on how the information is presented or the learning styles of the individuals. It is likely that how an individual learns has an effect on the value of the information presented; therefore, new information gained through collaboration with an organization engaged in a similar mission may be seen as more valuable than information obtained in a vacuum. I address this point later on but for my purposes here the goal is to establish that learning can have decreasing returns rather than to establish where those decreasing returns are most likely to occur.

## Public Sector Organizational Learning and Empowerment

Organizational learning in the public sector is more circumscribed than in private firms because when learned practices go too far afield from the stated policy goals of elected authority then political powers respond to reshape or realign the goals of public organizations (Mintzburg 1996; Pollack 2003). While predictability and uniformity may be desired by both political authority and the public at large (Bovens and Zouridis 2002), the public often does not have a well-defined concept of what they want or how they want it (Hupe and Buffat 2014). Additionally, when it comes to the predictability of policy outcomes, elected officials are often happy to let the bureaucracy proceed based on their own expertise, particularly for nonengineered problems (Jones and Baumgartner 2012). Non-engineered problems refer to those problems for which the policy process does not predict first-best solutions, for example, providing education, addressing issues of poverty, or addressing crime.

This lack of clarity on policy preferences and therefore on goals leaves agencies with a fairly wide range of objective for achieving policy goals (McCubbins and Schwartz 1984) particularly on issues that are externally focused such as insurance policy, water quality, or education (MacKenzie and Hafken 2002; Rauh 2015). This goes beyond transaction cost considerations (e.g., Feiock 2013) which are more about transaction risks and the factors affecting the perceptions of those risks. In the case described herein, individual agencies have a desire to collaborate and, but the benefits of learning are assessed incorrectly or are given a value that is tied to something other than the mission of the agency such as providing a politically appealing outcome that may nonetheless be costly (see Canes-Wrone 2015; Grose et al. 2015; and West 2004).

## Learning from Similar Organizations: Possible Threats?

When one considers organizational learning, it is helpful to consider from whom the organization learns. The failure of the New Public Management to deliver on the promises of increased efficiency and effectiveness has dispelled the myth that innovations from the private sector will lead to better satisfaction of public demands. This has given rise to institutional solutions in which similarly situated organizations operate within their set of norms and discourses to solve problems (Peters 2011; Hartley et al. 2013). This implies that organizations with broadly similar missions operate within similar institutional frameworks and thus when learning that is goal oriented occurs it is likely to come from these similarly situated organizations (Ayra and Lin 2007; Peters 2011). Put simply, organizations with broadly similar missions (Corrections and Probation both have broad missions of public safety) have more interorganizational linkages than their

organizations with more dissimilar missions (Wholey and Huonker 1993; Ayra and Lin 2007). Therefore, one may not be surprised if information sharing, collaboration, and learning occur between organizations with similar broad missions. These organizations also tend to compete for the same funds though and also tend to seek reputational advantage over the other by differentiating themselves (Carpenter 2001). Even though public funds represent a relatively stable source of revenue for public organizations (Gronbjerg et al. 1995), government retrenchment policies have led organizations to seek other funding sources (Salamon 1999; Ayra and Lin 2007). The resulting overlap in funding means that organizations with similar broad missions are also competing for allocations from similar pots of funding. Therefore, if these organizations were to learn from each other, they are also seeking a competitive advantage. If, as is argued herein, learning can be costly, then unless the learned behavior results in an efficiency gain that is at least equal to the cost to obtain that gain, or is associated with a corresponding increase in funds, then the strategy actually places the organization at a disadvantage.

## An Equilibrium Model of Organizational Learning in Public Organizations

Using the learning model was first proposed by Findlay and Kierzkowski (1983), i.e., comparative advantages for endogenous skill acquisition. This manuscript uses a general equilibrium equation for demonstration purposes in place of instrumental language in order to provide a formal statement that can be used to make predictions about the effects of learning and subsequent goal addition on organizations with finite budget constraints. Suppose that $G$ goals are mission specific at each instance, the remaining $(N - G)$ equals $U$, the nonmission-specific goals (Those goals which are applied by statute such as EEO, Affirmative Action, etc. – for an excellent summary of the importance of these to organization's service attainment see Piotrowski and Rosenbloom (2002), or Piotrowski (2010).). A survey of the organization's goals would therefore be:

$$UT + G(T - \theta) = NT \tag{1}$$

The total number of goals is always $NT$, comprising $UT$ nonmission-specific goals and $G(T - \theta)$ mission-specific goals.

Now consider that the organization's learning relative to its goals now includes a learning period in which its goals can be evolving based upon their experience with the other organization:

$$UT + G\theta + G(T - \theta) = NT' \tag{2}$$

Now the total number of goals $NT'$ is comprised of $UT$ nonmission-specific goals, $G\theta$ *goals in waiting*, and $G(T - \theta)$ mission-specific goals.

Organizational learning transforms the learned material into organizational goals after a time of $\theta$. This activity requires specific inputs to the arrangement (resources, personnel, technology, etc.) denoted by $K$. The "output" $Q$ for a goal can then be thought of in terms of a production function. This output can be expressed as the attainment of some level of service within specified costs. This study purposely does not address these as outcomes here since outcomes are notoriously difficult to measure and goal displacement tends to occur with output measures:

$$Q = F(K, G; \theta) \tag{3}$$

In which $Q$ is the output to the organization of acquiring new goals measured in cost savings to the organization that emerges after $G$ goals are nurtured in the network for time $\theta$ with $K$ units of resource inputs. The specific inputs are assumed to be fixed from an exogenous supply (this works theoretically since there are set budgets for organizations with priorities based on negotiated solutions). This assumes constant returns to scale in $Q$, $K$, $E$, and $\theta$. Therefore,

$$q = f(k), \tag{4}$$

where $q = \frac{Q}{G}$ and $k = \frac{K}{G}$, so $q$ represents the knowledge units acquired moving towards developing new goals if the organization inputs $k$ for the duration of $\theta$. Generally, knowledge units may be the perception that an action is particularly valuable to the organization or that a particular activity is costing the organization. This assumes that $f(k) > 0$.

Because each mission-specific goal embodies $q$ units of knowledge in terms of cost savings, and there are $G(T - \theta)$ mission-specific goals, the contributory ability of mission specific goals to the organizations is:

$$qG(T - \theta) = R_1 \tag{5}$$

and of nonmission-specific goals $R_2$ it is:

$$UT = R_2 \tag{6}$$

So $R_1$ and $R_2$ represent the contributory ability of the each goal to the broader mission. These are entailed in the services provided by the organization $S$.

The service delivery profile of an organization can be considered as a menu of single services, $S_1$ and $S_2$, the cost of which is determined by the price dictated by the markets. The production function for these services is:

$$\begin{aligned} S_1 &= S_1(R_{11}, R_{21}) \\ S_2 &= S_2(R_{12}, R_{22}) \end{aligned} \tag{7}$$

If the relative costs of providing services are such that both services can be provided in equilibrium, then the rewards for achieving both types of goals will be strictly determined by the service to cost ratio $p$ and the production function for each of the services. The benefit of learning about new (mission specific) goals will be $w_1 q = w_1 f(k)$, where $w_1$ represents the benefit for a one unit of knowledge increase and each goal possesses $q = f(k)$ units in cost savings. So the benefit of learning is about new goals determined by their payoff and the costs. The benefit for learning about nonmission-specific goals is $w_2$.

Consider now the learning costs problem. The interest rate in a "perfect world" market is denoted by $r$ that is applied to all monetized values – so it is constant. The gross benefit of acquiring new knowledge in a network arrangement is then:

$$\int_{\theta}^{T} w_1 f(k) g^{-rt} dt = \frac{1}{r} w_1 f(k) \left(g^{-r\theta} - g^{-rT}\right) \tag{8}$$

The costs of resources may consist of many elements; for the purposes here, this study treats them as unitary, but noting that $Q = f(k)G$.

Note that this integral is the gross benefit to the organization for pursuing a new goal (replacing or altering a goal). The rate at which an organization learns to value new goals and then learns to implement them is determined by the necessity of reaching the mission goals. In other words, it is clear that the organization must strive towards its mission goals regardless of which goals it chooses. Since the organization has $k$ limited resources, they must borrow from $k$ to cover the training and materiel costs of bringing on new goals. This means that goals which help it achieve its mission should be most preferred.

The costs of achieving any goal requires at least three inputs: (1) the knowledge fees and potential infrastructure costs associated with training employees and providing materiel; (2) the opportunity cost which is lost by the organization if they had chosen to reinvest those same funds during the training period for employees; and (3) the foregone increases associated with redirecting the employees efforts (if an employee is working in a new area under the new goals then they are not working in the previous mission goals). With regard to the first issue, this study assumes that each unit of training and material is equal to the marginal value of the output over aggregated time periods and discounted to present value. In other words, the costs of providing for

new goals are a time-bound cost-benefit calculation.

$$\frac{\Delta Q}{\Delta G} = f(k) - f'(k)k \tag{9}$$

So the change in outputs resulting from the change in goals is a difference function of the inputs needed to achieve both.

Subtracting the resource/training costs from Eq. 8, we see that:

$$\pi = \frac{1}{r} \times \left[ w \frac{\Delta Q}{\Delta G} \left( g^{-r\theta} - g^{-rT} \right) - w_2 \left( 1 - g^{-rT} \right) \right] \tag{10}$$

Notice that if $\pi$ is positive there is an incentive for new goals to be brought on. So if it is positive then there is a net benefit, provided goals are replaced or altered, but not taking on new goals (after all the assumption is that goals are altered or replaced but that $NT$ is stationary). If one removes the assumption that goals are stationary though and allow that organizations can bring on goals which they believe benefit its mission, then one sees that the net benefit for bringing on additional goals is reduced and the benefit of obtaining current goals is also reduced. The above equations imply that since the lifetime (organizational) benefit of bringing on additional goals encroaches on the costs of achieving its current goals, organizations would do better to adjust strategies for achieving current goals or replace existing goals.

## Example of the Department of Corrections in South Carolina

In the overall mission of ensuring public safety, the South Carolina Code 24–19-110 provides that an officer from either the Department of Corrections of the Department of Probation, Parole, and Pardon Services may serve to monitor a paroled juvenile offender under the state's Young Offender Parole and Reentry Services program (Program). There are required monitoring standards and reports that must be filled out as with any administrative process; however, the missions of the Department of Corrections and the Department of Probation, Parole, and Pardon are entirely separate. Corrections focus on inmates and rehabilitative services; Probation, Pardons, and Parole is community supervision (www.doc.sc.gov; www.dppps.sc.gov). The Department of Corrections lobbied to begin the program after an arrangement between the SC Department of Juvenile Justice with the Department of Probation, Pardon and Parole in 2007 known as the Intensive Supervision Program (SC DJJ 2007).

Under the Program Youthful Offenders (ages 17–34) who meet specific requirements (no felony, violent offenses, etc.) are slated for early but monitored release. The Program aims to address the societal needs of offenders including school and work attendance and to take actions which encouraged the completion of high school or the obtaining of a GED. Historically the monitoring activities of the Department of Corrections had been focused on monitoring recidivism without attention to the societal factors which impacted recidivism.

The cost in 2015 of housing one inmate for a year was $18,119 per year (SC Department of Corrections 2016). The cost per inmate was accounted for in a 9.6 to 1 officer to inmate ratio and the costs of food, medical supplies, overhead, etc. By contrast the average median salary of a Probation, Parole, and Pardons (2016) agent (the individuals normally dealing with this type of activity) is $48,719; with a median 29% fringe this comes to $62,847.51. With 20 cases per office that is an average cost of $3142.38 per individual. With a 42% recidivism rate over 5 years for traditional inmates and a 15.5% recidivism rate for the Program and the state of South Carolina's net present value tables with a rate of 1.7336% over a 5-year period, one sees that:

*Costs of Incarceration with a 42% Recidivism Rate*

$$\$18{,}119(.42) = \$7609.98$$
$$\$7609.98(1 - .017336)^5 = \$6972.83$$

$5378.45 is the potential cost over 5 years of an incarcerated individual.

*Costs of Incarceration with 15.5% Recidivism Rate*

$$\$18{,}119(.155) = \$2808.45$$
$$\$2808.45(1 - .017336)^5 = \$2573.30$$

$6972.83 − $2573.30 = $4339.52 in assumed potential cost savings for the Program over a 5-year period. However, this does not account for the fact that the Program has specific entrance requirements. If one considers that the SC Department of Corrections' inmate population consists of 50% of inmates who meet the age requirements and 66% of all inmates have a current or prior violent offense (SC Department of Correction 2016), then the population applicable for the program decreases sharply as does the comparative success. Assuming that even half of the individuals in the violent offender category are also in the age category, this means that 16.5% of the entire inmate population would be eligible for the Program. Likewise assuming that all nonviolent offenders were also in the age group, only 50% of the population would be eligible for the program. This places the true recidivism rate compared to the population as a whole at a minimum of 39% and a maximum of 54% if one considers a normal distribution of violent offenders across the population of inmates.

*Maximum True Recidivism Rate for Program*

$$\$18{,}119(.54) = \$9784.26$$
$$\$9784.26(1 - .017336)^5 = \$8965.06$$

*Minimum True Recidivism Rate for Program*

$$\$18{,}119(.39) = \$7066.41$$
$$\$7066.41(1 - .017336)^5 = \$6474.77$$

Effectively this means that it would have to be the case that 47% of the prison population must eligible for the Program for it to be as effective as the standard approach, a number which the Department of Corrections cannot obtain, considering that 40% of all adult violent crime arrests are against individuals aged 18–25 even though they comprise just 22% of the population (Bureau of Justice Statistics 2014). Therefore, one can say with some degree of certainty that the program is likely to be less effective than the standard Probations, Parole, and Pardons approach.

## Discussion

The intent of this study was to establish that learning has the potential to impose costs upon an organization and to identify some potential reasons why this may occur. To this end, the model and example above have shown that learning can affect the resource distributions of public organizations by identifying how learning that leads to a subsequent addition of goals or behaviors that are not aligned to the mission affects the allocation of funds to the organization as a whole. Empirical results have shown that the effect of learning on an organization depends on the number of goals in an organization and the allocation of funds to those goals. Therefore, as goals are added to a fixed allocation, unless they are explicitly cost-saving, they will result in a cost to the organization. Contrary to a straightforward application of organizational learning, unless the new activities an organization takes on are explicitly tied to a mission-specific goal in way that is either at least marginally substitutional (any additional resources it takes to achieve are made up for by efficiency gains) then taking on new learned behaviors will impose a cost on an organization.

This provides at least some explanation for why we do not see organizations jockeying for responsibilities in market-like competition but instead see organizations requesting that they be allowed greater administrative innovation with accompanying budgets (a central point of Carpenter's 2001 argument for expanding

reputations). There is an irony here though. Seemingly an organization would need to differentiate itself in order to show value and thereby argue for a larger allocation; however, learning in a collaborative arrangement is typically done between organizations with broadly related missions which have more interorganizational linkages than their dissimilar counterparts (Wholey and Huonker 1993; Ayra and Lin 2007). What the results here imply then is that even though funds to public organizations are a generally stable source of revenue (e.g., Gronbjerg et al. 1995), governmental retrenchment drive organizations to seek alternative funding sources (Salamon 1999). According to Ayra and Lin (2007), funding overlaps incentivize similar organizations to act as competitors rather than complements. It makes sense therefore that organizations with a similar broad mission, such as public safety, would want to collaborate and seek a competitive advantage in resources from the activities of the other organization. What the above results show though is that when this occurs, an organization can actually harm itself through such activities as opposed to gaining a competitive advantage.

Because an organization's capacity to achieve its mission-specific goals is an important determinant of its long-term success (both in terms of allocation and reputation, e.g., Carpenter 2001; Piotrowski and Rosenbloom 2002), the impact of adding costly activities provides another link between allocation, reputation, and goal attainment. The results of this study further suggest that the scale of an organization's activities is tied to its ability to take on new activities.

## Conclusion

This study suggests that equilibrium cannot be obtained from collaborative learning without inputs of additional resources or the displacement of some other goal or competency. The vignette provided suggests that even though the PPP produced better results in a nominal sense, the cost for achieving each individual result was greater than those costs incurred by corrections. This study extends previous work on organizational learning and collaboration by highlighting some of the potential costs associated with organizational learning. Most previous studies of collaboration and organizational learning have focused on the potential benefits of organizational learning such as improved performance (Arganoff and McGuire 2003) and management of resources (Silvia 2011) but have ignored some of the potential costs. In line with previous research (Grose et al. 2015; Song and Kolb 2012), it has been argued that organizational learning may impose costs because the pursuit of a goal may appear attractive on a politically attractive measure but may nonetheless impose explicit costs. These costs are likely to be higher in organizations that pursue less specialized missions and hence when monitoring of agency performance is more fluid. This analysis stresses the role that an outcome which plays well politically can have on increasing an organization's desire to increase its collaborative learning.

Organizational learning is quite obviously not explicitly costly; however, goals that are learned through collaboration with another agency should be given greater scrutiny. The model presented here indicates some reasons why and also points to some scenarios in which an agency may experience more costs than benefits from learning. Activities requiring the use of an increasing degree of knowledge learned outside the agency's specialization are more likely to impose long-run costs on an agency. Given the resource-dependent nature of public agencies, it will be more difficult for agencies without the capacity to readily demand increases in resources, or to make a case for resources specific to a learned activity, and to find collaborative learning opportunities that will be a net positive. This implies that agencies without strong reputations or substantial clout in the budget writing process may be limited in their ability to pursue beneficial collaborative learning arrangements.

This study also points to a problem of potential adverse selection in collaborative learning for public organizations. This may partly explain why more collaborative learning also increases

agency budgets (Kettl 2006). Organizations that are successful at collaboration may (1) realize that increased resources are necessary, whereas unsuccessful collaborations may both not recognize the necessity of additional resources and instead think that collaboration will reduce resource dependence, or (2) they may lack the status or ability to demand additional resources. Additional study in this area should then look not just at successful collaborations and identify what worked, but also failed collaborative learning opportunities and identify why they failed. One takeaway that will likely be present given this study is that in order to enjoy the benefits of collaborative organizational learning, agencies must increase their resources lest their current missions suffer.

# Lebanese Bureaucracy

Imane Hijal-Moghrabi
Public Administration and Leadership Program, The University of Texas of the Permian Basin, Odessa, TX, USA

## Synonyms

Administrative apparatus; Public administration; Public offices; Public service

## Definitions

Lebanese organization of government; The Lebanese machinery of government; The executive branch of organizations of the Lebanese government.

## Introduction

Lebanon is a small Middle-Eastern country, located on the Mediterranean at a crossroads between the East and the West – a very strategic location that made the country exceptionally attractive to invaders and conquerors throughout its long history that dates back to over 6000 years. However, Lebanon, as we know it today, is a recently created entity, invented by the French in 1920 to replace what was previously known as "Mount Lebanon" under the Ottoman Empire (1516–1918). This entity was placed under the French Mandate for 23 years before it became an independent state in 1943.

The Post-independence Period witnessed the development of the country's administrative and economic infrastructure and, hence, the institutionalization of its bureaucracy. In the 1960s, Lebanon flourished economically to become the "Pearl of the Mediterranean." This "golden age" was, soon, put into an end with the outbreak of the Lebanese Civil War in the mid-1970s that turned the country and its bureaucracy back to the point of zero. Shortly after the end of the civil war in 1990 to the present, Lebanon has been undergoing serious attempts to rebuild, revitalize, reform, and modernize its bureaucracy.

This entry sheds light on the Lebanese bureaucracy. It determines its scope and size, highlights its major characteristics and deficiencies, and tracks its evolution since independence to the present, emphasizing the efforts at institutionalizing and reforming it.

## Bureaucracy in Lebanon

### Scope and Size

Public bureaucracy, in general, is the locus of government action and the key institution of governance and administration. It refers to the administrative apparatus, consisting of all public offices that are in charge of implementing policies and programs and delivering services to the public.

The Lebanese bureaucracy is the executive arm of the Lebanese government – the means through which policies are implemented and services are delivered. The Lebanese bureaucracy encompasses the public sector, which comprises the central administration (all ministries including the administrative cadre of the Ministry of Defense, the Ministry of Justice, the Ministry of Interior, and the Ministry of Foreign Affairs), regional and local administrations, public autonomous agencies, and independent services.

The Lebanese bureaucracy is governed by a set of laws and regulations, most of which date back to the 1950s – most notably, the Public Personnel Code (Legislative Decree No. 112/1959) and the Administrative Organization Code (Legislative Decree No. 111/1959). The bureaucracy is also controlled by four external watchdog agencies: the Civil Service Board (CSB), the Central Inspection Commission (CIC), the Bureau of Accounts (BOA), and the General Disciplinary Council (GDC).

The scope and size of the Lebanese bureaucracy has expanded since the days of independence due to the expansion of the role of government and its intervention in social and economic development. Given its population, Lebanon is considered to have a large public sector

(Haase 2017). As estimated by the World Bank (2005), the public sector in Lebanon employs between 220,000 and 230,000 public employees.

The civil service in Lebanon is organized into five grades. Senior officials (General Directors and Directors or Chiefs of Services) fall within Grades I and II, respectively. Middle management positions (Chiefs of Bureaus and Chiefs of Sections) are classified as Grade III. Clerical and manual positions fall within Grades IV and V, respectively.

## Characteristics and Deficiencies

We cannot separate the bureaucracy from the environment in which it operates. This environment, whether internal or external, greatly affects and shapes the way the administration functions. The Lebanese bureaucracy is no exception. It has been for long affected by social attitudes and values inherent in the Lebanese culture and society. Thus, in order to properly understand the Lebanese bureaucracy, it should be viewed in the light of its history, society, and political culture.

The Lebanese society has been described as a pluralistic society. In this respect, two broad aspects of traditional pluralism are prevailing in Lebanon: one is the extraordinary pervasive influence of families and family allegiances in politics, and the other is the religious and sectarian fragmentation of the country. So strong are these factors that Lebanon's political and administrative institutions, traditional and modern, have been molded to reflect them (Hudson 1968).

The family is one of the basic fundamental institutions in the Lebanese society. It plays an important role in shaping the values and the way of life of its members. The Lebanese family is patriarchal and very closely knit one. The Lebanese are born into the family and find it extremely hard to leave it. In fact, they seem to surrender their independence and individuality and submit to the rule of the father (Iskandar 1964). The patriarchal structure of the family is reflected in the bureaucracy, where power and authority are concentrated at the top of the hierarchy, and little authority is being delegated downwards. Family ties and allegiances also resulted in nepotism, favoritism, and corruption that have plagued the Lebanese bureaucracy for a long time.

Sectarianism is another aspect of traditional pluralism in Lebanon. The religious sect persists as a social entity that greatly influences and determines the entire way of life of its members. "To leave one sect is to leave one's whole world, and to live without loyalties, the protection of the community, the consciousness of social identity, and the comfort of normality" (Hourani 1954, p. 64). Religious sectarianism and confessionalism in Lebanon greatly interfere with the governmental and administrative system. The three most important legal manifestations of sectarianism can be found in the National Pact of 1943, the Personal Status Law, and the bureaucracy.

At the administrative level, before the 1990 constitutional amendment, the bureaucracy was regarded as a "sectarian establishment" (Kisirwani and Parle 1987) that represents Lebanon's many religious and ethnic groups. However, the 1990 amendment of the Constitution eliminated sectarianism as the basis for employment for all grades, except Grade I positions, and required that these positions be distributed equally between Muslims and Christians. Nevertheless, sectarianism informally persisted, particularly in matters of promotions and transfers. Sectarianism has imposed restrictions on the bureaucracy to the extent of paralyzing its normal role in many circumstances. This is particularly true because when sectarianism provides advantages to certain employees, this is often done at the expense of merit and competence.

Related to family allegiances and sectarianism, political elite is another aspect of the Lebanese society that has significantly influenced the bureaucracy. The political elites share power across communal lines and run the country by compromise, keeping in mind the interest of their constituents. These people are referred to as Zuama'. A Za'im, in a specifically Lebanese sense, is a political leader who possesses the support of a locally circumscribed community and retains this support by fostering, or appearing to foster, the interests of as many as possible from

amongst his clientele (Hottinger 1966). Viewed this way, political elites have fostered a patron-client relationship that has obstructed the proper functioning of the bureaucracy in Lebanon and resulted in widespread corruption.

Bureaucratic corruption is a salient feature and an epidemic problem of the Lebanese bureaucracy. Bureaucratic corruption in Lebanon is found in all its forms. It is manifested through favoritism, nepotism, bribery, intermediary (or *wasta* in the Lebanese terminology), and pay-off usually as a direct exchange for a service. These forms of corruption are the result of a patron-client relationship and the weakness of administrative control mechanisms and hierarchical supervision. More importantly, these are the outcomes of a weak professional ethics and a lack of commitment on the part of civil servants. Civil servants resort to *wasta* for attaining personal benefits as well as for promoting institutional and public ends. Citizens, in turn, seek *wasta* with regard to almost any transaction they have with the bureaucracy by appealing to people of influence such as politicians and connected officials to get their things done. Bureaucratic corruption and inefficiencies have engendered a "service delivery gap," which is often filled out by the private and civil society organizations (Haase 2017).

As a result of bureaucratic corruption, there is a popular distrust of government in Lebanon – a strong feeling shared with many that the bureaucracy is not regularized as well as it is personalized and that the public office is viewed not as a trust and a service to the whole society, but as a means to preserve social influence and power. More importantly, the bureaucracy is considered inefficient, ineffective, unresponsive to the needs and demands of people, and even, unable to provide its citizens with basic goods and services.

One further characteristic of the Lebanese bureaucracy is that it is resistant to change. Resistance to change is a normal social phenomenon. People are accustomed to a norm of conduct, and such norms cannot be dropped easily. People tend to preserve the status-quo because they are afraid of the possible risks underlying change. Others defend the status quo because they are, simply, part of it. The Lebanese experience is no exception. The outcome has been, however, the dominance of previous norms of conducts. These attitudinal problems have constituted a serious obstacle in the face of several attempts at reforming the administration.

In addition to these attitudinal problems, the Lebanese bureaucracy cannot escape the heritage of the past which greatly influenced and shaped its institutions and procedures. The Ottoman Rule and the French Mandate have left deep imprints on the culture of the Lebanese society, in general, and on the way the bureaucracy operates, in particular.

This has been manifested, mainly, in one of the basic features, and most serious problems, of the Lebanese bureaucracy – the high degree of centralization of administrative authority at the top of the hierarchy where all decisions, regardless of their substance and importance, are concentrated. This tendency toward overcentralization overburdens senior officials with petty details, as well as underutilizes the time and talents of subordinates. Tasks that could readily be executed by subordinates often sit on their desks awaiting instructions from above.

Related to the idea of overcentralization is the idea of excessive controls. Signatures and counter-signatures are required extensively and almost on every administrative transaction. Controls by various administrative echelons and external control agencies, such as the Bureau of Accounts, the Central Inspection Commission, and the Civil Service Board, are extensive and, sometimes, overlap.

Another carry-over from the Mandate Era is the legalistic orientation of the Lebanese bureaucracy (Bashir 1964), whereby laws specify administrative functions in details and place greater emphasis on the strict enforcement of legal provisions in their narrowest sense. Laws and regulations have been devised in such a specific and detailed manner that little to no discretion can be exercised by the individual civil servant. Such formalization has paralyzed the work processes

and procedures of the bureaucracy and resulted in serious delays and obstruction of developmental projects badly needed in the country.

The Lebanese bureaucracy is not only highly centralized but also highly authoritarian in nature (Bashir 1977; Iskandar 1964). The system of communications and relationships between superior officers and their subordinates within the various levels of the hierarchy is dominated by an authoritarian approach. For instance, the Legislative Decree No. 111/1959 requires the subordinate to blindly obey his superior and execute orders even if these orders are violating the law. As a result of this authoritarian approach, employees display little initiative, or independent judgment, and shy away from assuming responsibility. The authoritarian nature of the system, further, creates fear and anxiety in the heart of civil servants toward revealing some information they feel they can comfortably say.

This authoritarian approach is deeply rooted in the Ottoman and French rule, which attempted to develop and foster the responsibility and the accountability of the civil servants to the Ottoman and French masters rather than to the people. This attitude of domination on the part of superiors and the obedience on the part of subordinates is not only the result of centuries of foreign rules, but the outcome of the patriarchal nature of the Lebanese society as well. The highly centralized and authoritarian features of the Lebanese bureaucracy have resulted in a set of bureaupathologies, or dysfunctional behavior, that have impaired the efficiency of the administrative apparatus such as rigidity, red tape, and delay of actions.

Last but not least, the Lebanese bureaucracy is currently governed by a set of outdated laws and regulations that were issued more than 50 years ago. They were appropriate to their time, but have not been significantly modified since. The reliance on outdated legal texts has rendered the bureaucracy unable of keeping up with the changes of the day.

## Evolution and Reforms

The history of the Lebanese bureaucracy since independence can be subdivided into three important eras: The Postindependence Era, The Civil-War Era, and The Post-Civil War Era.

### The Postindependence Era (1943–1975)

President Bechara el-Khoury assumed office immediately after independence for two consecutive terms (1943–1952). The major concern of his administration was to consolidate peace and order in the newly independent state and to amend the Constitution. During this time, Lebanon moved quickly onto the foreign scene through its participation first at the regional level as a founding member of the Arab League in 1945 and, then, at the international level as the founding member of the United Nations in the same year. Efforts also were made to establish diplomatic relations with a number of countries. However, all this came at the expense of neglecting the country's administrative affairs.

Personnel matters were handled on personal basis, as there was no central personnel agency to control and coordinate personnel-related issues. Within each agency/administration, there was, instead, a unit referred to as "*Diwan*," or secretariat, in charge with these matters. As a result, nepotism in the appointment of civil servants and laxity in the enforcement of laws and regulations became a normal practice (Bashir 1977). However, two notable achievements took place under the Khoury Administration: the passage of a new Municipal Law in 1947 and the establishment of the Bureau of Accounts in 1951 as the guardian of financial morality within the bureaucracy. This audit court is entrusted with the supervision of public funds through checking and scrutinizing the legality of financial transactions and their conformity with rules and regulations.

Khoury was followed by President Camille Chamoun (1952–1956) who was aware of the need for administrative reforms. Accordingly, Chamoun passed several decree laws as an attempt to reorganize the bureaucracy. Most remarkably was the Legislative Decree No. 13/1953 which formally organized the Lebanese bureaucracy by creating civil service grades and establishing competitive examinations as a condition for appointment in high administrative echelons. In addition, the Chamoun Administration lifted immunity over civil servants and, as a result, terminated the service of a number of public employees who were accused of partisan conduct and abuse of public authority. Equally

important was the establishment of a new Ministry of National Planning to be responsible for formulating an economic and social plan for the country in 1958.

Among the other developments that took place under the Chamoun Administration were the recruitment of a Ford Foundation consultant who was requested to conduct a comprehensive study of administrative reform and the establishment, probably for the first time, of seven public autonomous agencies which set in motion an important trend that continued under the Shehab Administration. In 1958, the country witnessed serious internal political turmoil that resulted in the almost collapse of the political system in Lebanon and the obstruction of the developmental plans that were underway.

The real institutionalization of the Lebanese bureaucracy, however, occurred under President Fouad Shehab (1958–1964) who attempted to initiate an ambitious and comprehensive governmental reform, encompassing administrative, social, and economic endeavors. His motto was to build "the State of Independence" (Crow and Iskandar 1961; Grassmuck and Salibi 1964). He, apparently, saw the restoration and the strengthening of the administration as a means of establishing the power of the state over the sects and over local political leaders (Grassmuck and Salibi 1964). Shehab thought of professionalizing the civil service and using it as a tool to overcome Lebanon's factual politics by decreasing his contacts with traditional politicians and by relying, instead, on a cadre of competent and efficient civil servants.

The Shehabi reform was characterized by the use of a reasonably sophisticated and well-organized machinery. The major emphasis of the Shehabi reforms focused on revising many of the basic policy laws and on dealing with all the features of the administration, including personnel-related issues, work methods and procedures, and inspection and control. These attempts were embodied in a set of legislative decrees through which a prominent movement was materialized. The most significant of these attempts was the passage of a new personnel code (Legislative Decree No. 112/59); the creation of two external control agencies – the Civil Service Board (Legislative Decree No. 114/59) to be in charge with coordinating all personnel matters and the Central Inspection Commission (Legislative Decree No. 115/59) to be in charge with overseeing administrative transactions and conducting studies to improve the bureaucracy – the reorganization of the Bureau of Accounts (Legislative Decree No. 118/59), in addition to the establishment of the National Institute of Public Administration and Development within the Civil Service Board to be entrusted with the responsibility of preparing candidates for public offices and training already existing employees throughout the bureaucracy.

Reform attempts that took place under Shehab were the most serious and comprehensive. They laid down the foundations and the present framework of the Lebanese bureaucracy. The establishment of the CSB and CIC, for instance, intended to depoliticize the administration and promote an impartial bureaucracy, free from political pressures and interferences. Similarly, the passage of the new personnel code, determining employees' rights and duties, and covering all personnel matters relating to selection, appointment, testing, training, promotion, and transfer, laid down the bases of the merit system within the bureaucracy. Other notable achievements were in the social, economic, and developmental areas. These include the establishment of the Central Bank and the National Security Fund in 1963; the establishment of the council of Implementation of Major Projects for the City of Beirut in 1963; and the creation of the Fruit Office, and the Green Plan, just to name a few.

The 1959 reforms constitute, therefore, a turning point in the history of the Lebanese bureaucracy. Reformers started to look at the public service from a new perspective. This, of course, was accompanied with a shift in the role of government from a provider of public services to a planner and a participator in the process of economic and social development as well.

President Shehab was succeeded by President Charles Helou (1964–1970), who was committed to protect and preserve the Shehabi achievements. His reform attempts centered around eliminating

corruption in the bureaucracy through taking purgative measures against corrupt civil servants and through establishing a General Disciplinary Council to ensure proper conducts of public employees.

Helou was followed by President Suleiman Frenjyeh (1970–1976) – a traditional leader who opposed the Shehabi line. Frenjyeh sought to reassert the authority of the old political, sectarian, and feudal class by allowing increased political intervention in the bureaucracy. Before the end of his term, the civil war erupted in 1975, entering the country in an endless unrest and deterioration on all fronts.

### The Civil War Era (1975–1990)

The war resulted in tragic loss in human lives, alarming emigration of the youth and the educated individuals, widespread damage to the country's infrastructure, and the collapse of the economy. The total damage of physical assets sustained during this period was estimated by the United Nations at $25 billion (United Nations Development Program 1991).

With the advent of the civil war in the mid-1970s, reform programs were interrupted, and the bureaucracy returned to the starting point – to what it was before independence and even worse. The civil war inflicted serious damages to both the body of the bureaucracy and its spirit, thus moving the administration from a state of disorder to a state of paralysis and from deviation to collapse. It resulted in an extensive damage to office buildings, facilities, and equipment, as well as in serious devastation in the provision of essential public services due to significant damages in the country's infrastructure. It was reported that in 1992, about 50% of telephone connections were in service. "All water treatment plans were seriously damaged; the power system has 500–600 M.V. generating capacity; most of government schools and hospitals were severely damaged, and there was no functioning treatment facilities" (World Bank 1992, p. 19).

The most serious damage was, however, in the erosion of higher authority which was manifested through the lack of control and supervision within the bureaucracy. For instance, the Civil Service Council, the watchdog agency of the merit system, did entirely abandon its oversight function. The major criteria in personnel decisions on initial appointments and promotions were personal influence and external pressures (Kisirwani and Parle 1987). The war also led to a widespread corruption of all forms and to a large increase in all types of external pressures on the bureaucracy.

In addition, the war resulted in a shortage of personnel both quantitative and qualitative due to natural attrition, resignations, and to the Lebanese government policy to freeze civil service appointments. It was estimated that as of 1992, about 60% of civil service positions were vacant, in addition to approximately 2000 public employees who were still on the payroll but hold other jobs in Lebanon or abroad (Knox 1992). As for the remaining civil servants, many of them were seriously handicapped by outdated skills and patterns of thought as a result of the lack of exposure to new ideas and developments.

The war also resulted in a significant loss in public revenues emanating from the unwillingness of the public to pay for inadequate public services and the inability of government to collect various taxes and fees. The serious deterioration in the provision of essential public services led to the emergence of certain private groups which particularly replaced the government in the provision of alternative form of services (such as electricity and telecommunications) at rates beyond the reach of middle and lower income groups (Antoun 2008). In short, during the civil war, the main issue was how to settle conflicts and stop the bloody war. No attempts for administrative reform were undertaken.

### The Postwar Era (1990–Present)

The Tai'f Accord of 1989 marked the end of hostilities and ushered a new era of peace and normalcy. The first priority was to implement the Tai'f Accord through amending the Constitution and holding parliamentary elections. Rehabilitating and reforming the bureaucracy imposed itself as an urgent need. And the first postwar government, headed by Prime Minister Rafik Hariri, showed a great commitment to revitalize and reform the bureaucracy from the damages inflicted upon it by the civil war. This

commitment was coupled with a serious support by a number of international donor organizations such as the World Band and the United Nations Development Program (UNDP).

Rebuilding the bureaucracy and improving its capabilities were seen as the precondition for rebuilding the economy and restoring government services. For any expected success in the economic, social, or political development of the country depends a great deal on the reinvention of a bureaucracy capable of guiding such programs to their successful ends.

In addition to rehabilitating governmental buildings and offices, administrative problems in postwar Lebanon have been essentially expressed in terms of overstaffing at lower levels, understaffing at the senior and middle management levels, inadequate skills and training, structural distortions, outdated methods and practices, low wages, loss of resources, in addition to widespread spoils and corruption. Thus, among the major issues that postwar administrative reforms had to address were reorganizing the structure of the bureaucracy, filling vacancies, streamlining work methods and procedures, activating training, eliminating corruption, creating a job classification plan, and a new pay scale.

In order to carry out the task of administrative reform, an Office of Institutional Development – later known as the Office of the Minister for Administrative Reform (OMSAR) – was established to study and assess the needs of rehabilitating and reforming the bureaucracy. The office is supported and funded by the United Nations Development Program and is directly related to the Minister of State in charge with the responsibility of administrative reform. At the outset, the role of the office was, mainly, to support the government in its initial efforts to rebuild government services and, thereafter, to ensure continuous improvement is made. OMSAR has been seen as central to the reform process, without which the necessary energy and momentum for reform could not be developed.

Among the major issues that OMSAR is currently dealing with are: reviewing the current structure of the Lebanese bureaucracy; reviewing the present organizing texts most of which are outdated going back to the 1950s; reviewing work methods and procedures as well as the new technology; and assessing human resources needs in terms of training, coaching, evaluations, etc. However, administrative reform is not solely the responsibility of OMSAR. External control agencies play an important role in this process, and so does the National Institute of Public Administration which was turned into an autonomous agency in 2000.

## Conclusion

The Lebanese bureaucracy, as we know it today, is only 75 years old. However, it has been shaped by a long history of Ottoman and French domination and by the deeply rooted social norms and political culture of the country. Although the characteristics and deficiencies of the Lebanese bureaucracy seem to be static, the evolution of this bureaucracy since independence reflects a constant change, characterized by its ups and downs within a life cycle of birth, death, and then rebirth. This life cycle has been translated in terms of initiation, reform, deterioration, rehabilitation, revitalization, and modernization.

Since its independence, Lebanon has witnessed a series of attempts aiming at reforming and modernizing its bureaucracy. Almost every administration carried along with it a program for administrative reform, with the Shehabi reforms being the most significant of all. In the past two decades, there have been serious efforts, coupled with a serious commitment, to reform the bureaucracy – a commitment on the part of the government and on the part of international organizations that are supporting and funding administrative reform programs. Reforming and modernizing the bureaucracy has been viewed as an *apriori* condition to restore trust in government, to improve service delivery, and to rebuild and boost the country's economy.

## The Lebanese Higher Education Landscape

### The Historical Evolution of Higher Education in Lebanon

To be able to understand how the Lebanese higher education landscape came to be, as we see it today, one must understand the historical context in which education and higher education evolved in Lebanon. Lebanon, a republic formally established in the early twentieth century, was historically part of the Ottoman Empire since its inception in the fourteenth century until its downfall in 1923. Directly after, Lebanon was temporarily held under colonial mandate by the Republic of France, until attaining its independence in November 22, 1943. The country thus carries a heritage from the Ottoman Empire, which demised in the form of a Turkish colonial state, followed by a brief but influential French mandate of 20 years ending in independence. The socioeconomic and geopolitical factors (during the French mandate) were manifested at two levels: the local level where the competing interests of Lebanon's religious sects sought to establish strong *national* footholds by securing regional and international alliances, and a regional and the international level expressed through competing economic power in post-industrial-revolution Europe. The historic heritage and both the socioeconomic and geopolitical dynamics during the formation of Lebanon have influenced the molding of its educational landscape and the role of the "state" in regulating education amid conflicting sectarian interests, albeit in an amalgamate residual fashion that echoes both Ottoman and French eras (Bashur et al. 1999, pp. 106–107).

The Ottoman Empire, until the years that preceded its demise, approached education as a religious matter that needs not to be regulated by the state but by the religious sects themselves who were indeed left free to establish institutions of education and regulate their educational affairs (Bashur et al. 1999, pp. 106–107; Bashur 1974). This margin of tolerance gave rise to a strong presence of Christian missionaries who invested heavily in religious institutions and especially those for education in Lebanon. This amounted to 47 schools by the year 1882, two of which have been considered as landmark educational achievements in Lebanon and the region: The Syrian Protestant Collage (now the American University of Beirut) founded in 1866 by the Evangelists and the Saint Joseph Collage (now the University of

Saint Joseph) founded in 1875 by the Jesuits. However, some time before that, the Ottoman Empire's lack of interest in regulating education took a turn in 1846 when an Ottoman Imperial decree authorized the establishment of a ministry of *knowledge* (education) which in turn replaced the religious sects' jurisdiction over education. This decree naturally covered Lebanon being part of the Empire (Bashur et al. 1999, pp. 108–112). The decree stipulated that education is divided into elementary, secondary, and higher stages and that it is free for the public, which indeed holds true today as mandated in Lebanon's constitution. It also reserved the rights for religious sects to establish schools but it differentiated public and private institutes of education. By 1869, the Ottoman Empire had established public (state) schools that were very limited in number and of mediocre standing compared to the prevalent private schools. The first attempt by the *state* (at that time the Ottoman Empire) to regulate education was in the form of regulations on private institutes such as the need for approval of the programs being taught (Bashur et al. 1999, pp. 108–112). In 1913, the importance of education and the role of the state were further emphasized by a decree stating that elementary education is both free and mandatory to the extent that parents were imprisoned for not assuring their children's elementary education. It is worth noting that due to their limited number, their less than average conditions and teaching capabilities, and due to the anti-Turkish nationalistic sentiments, the Lebanese *communities* did not trust the Ottoman public school system; they deemed it of poor quality and incapable of developing its students' abilities and enabling them to reach better social standings. This led to stronger rooting of private education, something that is still engrained in the Lebanese culture today (Bashur et al. 1999, p. 117).

The French mandate strengthened this tendency further, contradicting by this their own educational philosophy implemented in France, and encouraged the privatization of the education system. This resulted in a major increase in the number of private institutes of education from 668 private schools in 1919 (the year the Allied forces entered Lebanon) to 1279 in 1943 (the year of independence) with a mere 308 of the schools being public equivalent to only 19% of the total number of schools (Bashur et al. 1999, pp. 173–175). The French policy further subdued state education by heavily funding private schools who taught French and French curricula (almost all private schools); for example, 90% of the student of Jesuits schools where fully financially sponsored (Bashur et al. 1999, p. 121). This policy also gave way to a Jesuit domination of the education system throughout the period of the mandate and well into the post-independence era till the late 1950s, where the Jesuit fathers supervised the ministry of *knowledge and arts* thus controlling school curricula, teaching language, degree types, and examination ordinances (Bashur et al. 1999, p. 124).

This snapshot allows for a reflection upon how the historic factors and their postindependence residual influences, alongside severe social, religious, and political divisions, paved the way for an entrenchment of a multisectarian private system of education. Moreover, the political system in Lebanon, which is sectarian in nature, controlled the institutionalization of education and mainly sought to serve its own agendas without fear of accountability due to lack of monitoring mechanisms and regulatory legislation that were beyond the reach of the country's weak parliament (Bashur et al. 1999, p. 146). The result of a centralized system, which was controlled politically and in the absence of accountability, was devastating and quite the opposite of what would be expected, i.e., instead of centralized monitoring and regulation, absence of regulation prevailed and the education sector suffered from violations and irregularities. We conclude this section by quoting from Bashur et al. (1999, p. 149), "it is by no historical chance that the condition of the State's administration of education is suffering and lost among the quantum numbers of ministerial directorates, administrations, and units but rather it is the manifestation of the absence of a political will and decision to found a reformed education system." The role of the State in higher education is further investigated, along with the issues of centralization vs. decentralization, in the section "State and Higher Education."

## Description of Current System

### The Lebanese Higher Education Institutions

Lebanon's Education sector is enormous as it includes one third of the population and forms an intricate space where social, economic, and political factors and agendas intertwine (Amine 1994, p. 13.). Historically, Lebanon attained a regional reputation as a node of higher education, cradling the oldest and the most prestigious universities in the Arab world. In addition, the existence of modern (founded in nineteenth and twentieth century) higher education institutions; the increasing social pressure of a small sized population, enhanced by limited natural and economic resources; a geostrategic position in the Arab world; and an early embracement of a global economic market resulted in prioritizing the development of human capital to service the economic sectors both nationally and regionally. This in turn increased the demand on higher education and led the way to social and political groups catering for this demand by establishing new institutes (Amine 1994). This massification of higher education demand and provision started in the 1960s with President Fouad Shehab's program of state reform and building of state institutions. Strangely enough, the massification continued throughout the Civil War, which started in 1975 and ended in 1990. The increased demand and supply in education in an era of chaos, unaccountability, warring factions, and lack of state supervision came at a heavy price, as it undermined the quality of education (Amine 1994, p. 17). Of course, some higher education institutions strived and did excel by maintaining highest possible standards of teaching, and these were the institutes that allowed Lebanon to safe keep its reputation as a node of higher education in the Arab world. The above introduction helps to explain the increased number of higher education institutions and underlines the wide variations of quality between institutions and the impact of the Civil War on education in Lebanon. It also shows the ability of the current system to challenge any attempts to reform and establish quality in education. In preparation for further elaboration, in the subsequent sections, on the challenges and factors that impeded the progress of the Lebanese higher education, (whether intrinsic within the structure of system itself or residuals from the Civil War or originating elsewhere) a listing of the institutions of higher education will be presented.

Higher education commenced in the nineteenth century, by the founding of the Syrian Evangelical College in 1866, which was later named the American University of Beirut (AUB) (www.aub.edu.lb), followed by the University of Saint Joseph (USJ) in 1875 (www.usj.edu.lb) and the Sagesse University (which was first a law school), also in 1875 (www.uls.edu.lb). The Middle East University was founded in 1939 (www.meu.edu.lb), and then the Lebanese American University (LAU) in 1947 which was then named the Beirut College for Women (www.lau.edu.lb). A milestone in the evolution of the Lebanese higher education scene was the establishment of the Lebanese University (LU) in 1951, which was and still is today the largest and the only state funded public university in Lebanon (www.lu.edu.lb). Other private universities followed such as Haigazian University (HU) which was founded in 1955 (www.haigazian.edu.lb), the Beirut Arab University (BAU) in 1960 in affiliation with the Egyptian University of Alexandria (www.bau.edu.lb), the Holy Spirit University of Kaslik in 1961 (www.usek.edu.lb). These institutions, to a large extent, were able to preserve a reputation as Lebanon's and the region's most elite and prestigious universities and constituted a major influence in the higher education area in the region and Arab World. Suffice it to say that the impeding geopolitical and sectarian pressures, during the Civil War, resulted in the creation of additional universities during the period from 1980 to 1990, such as the Beirut Islamic School in 1986 (www.biu.edu.lb), the Notre Dam University in 1987 (www.ndu.edu.lb), University of Balamand in 1988 (www.balamand.edu.lb), and Al Manar University of Tripoli in 1990 (www.mut.edu.lb). Some of these institutions established themselves as serious universities and contributed to the much needed provision in higher education in a country divided by war and sectarianism. Year 1990 marked the end of the Civil War and a new

postwar era for the higher education landscape, which grew immensely for the past two decades. With increasing public demand for higher education, the system now caters to more than 190,000 students in 2015 compared to only 115,000 in 1995. This rise was mainly due to the private sector economy suddenly flourishing and rapidly expanding due to postwar investments and economic opportunities (Tempus 2012). The added provision was largely in the form of a large number of new private universities. The number of higher education institutes almost doubled since the 1990s with an increase of 22 new universities, all-private (MEHE 2016). At an estimated population of less than four million, Lebanon is now serviced by 48 higher education institutes, only one of them is public – the Lebanese University. Of the 47 private institutions, 36 have been given the license of a university whereas 11 compromise technical institutions, university collages, and institutions for theology and religions. These institutions have been founded mostly after the 1990s and have less than three faculties and mostly award technical or bachelor degrees.

#### Typology and Characteristics

The typology of the Lebanese higher education landscape is multifaceted. It is identified by a vast domination of private institutions and with one public university, which caters for 40% of the total population of students. However, the diversity is also manifested in many other aspects such as the university systems themselves: American, French, British, Canadian, Egyptian, and hybrids thereof. Universities also vary in whether they are religious/sectarian or secular, nonprofit or for-profit, or entrepreneurial as in family ventures or established by legal entities. The characteristics are vastly varying and although the scope of this study does not address these characteristics directly, it is important nonetheless to identify, analyze, and understand the major differences among the universities. Table 1 summarizes the main characteristics of the 36 private universities:

#### Sectarianism and Higher Education

The sectarian political factors exert significant pressures on the education system as a whole, including higher education, to the extent that the latter has been subdued to narrow political agendas that mirror prevalent political and sectarian divisions (Alamin 1994, p. 22). One illustrative example of this state of paralyzes is the divergence and lack of consensus, among politicians, and by consequence of pressures exerted by politicians, among education policy makers, on a unified "History of Lebanon" textbook to be adopted on a nation-wide basis in all Lebanese elementary schools. This is a simple, yet powerful example, on how sectarianism has intertwined with and consequently paralyzed the educational system's autonomy and integrity. This sectarian schism in education, which has its roots in the nineteenth century, was manifested concretely in the early 1970s on the eve of the Civil War, in the form of opposing views on the identity of Lebanon (Alamin 1994, p. 38). Ideological politics seeped into the classrooms and the textbooks with students' political views being influenced by sectarian pressures from those sharing their religious affiliation and by education as well. As a result, the education system was molded into serving the sectarian aspirations of the political groups, which dominated the geopolitical spheres in Lebanon.

## State and Higher Education

### The Role of the State

The intention of this section is neither to introduce the various models and systems of governments worldwide nor to present a political analysis discourse on Lebanon as a "state" and its system of government. The aim is to situate the Lebanese model of government within the context of higher education and to highlight the role of the state in this sector. It would help in this respect to note some of the major differences between the government system in Lebanon and those of its neighboring Arab countries. Elia Harik (Bashur et al. 1999) argues that most Arab countries can be depicted as "Patron" states or as transitioning "Patron" states that are typically based on centralized systems of governments where the state is in close control of all economic, political, and

educational matters of the country. These countries approach education, including higher education, as a national priority with the purpose of raising politically indoctrinated generations. They also consider that it is the unquestionable duty of the state to provide education to the public. Lebanon, Harik continues, has been characterized as a nonauthoritarian democratic form of government that allows for a provision of education by both the private sector and the state itself. As we have seen in the previous section, the Lebanese government since its independence has allowed the private and civil sectors to provide for education and specifically higher education, while playing the role of a monitor and regulator. According to Harik, a departure from this policy could, however, be observed in the directions taken by the post-Civil War governments since the early 1990s. They started to adopt characteristics of the "Patron" state by increasing control in several aspects of life and specifically education, which the new governments started viewing as an opportunity to forge a common national identity within post-Civil War generation. Examples of this are the attempts by the government to establish unified pre-higher education curricula that apply to both public and private schools. The more important argument that Harik presents is establishing doubts on the ability of the government in Lebanon to represent the interests of the "public good," which is quite difficult to define, and consequently increase its control on such aspects of the "public life" and specifically education; he also raises an even more important issue on whether the government in Lebanon has actually the capacity and capability to exercise such an increased control.

## The Regulation of Higher Education in Lebanon

The Lebanese Constitution ensures the freedom and independence of education, it states "...education is free so long as it is not contrary to public order and morals and does not touch the dignity of any of the religions or creeds. No derogation shall affect the right of religious communities to have their own schools subject to the general prescriptions on public education issued by the State" (Article 10 – Lebanese Constitution). However, it does not establish the right of nor guarantee the provision for each citizen to have proper education.

Higher education in Lebanon is divided into two categories: vocational tertiary education and general or nonvocational higher education – in this article we focus on the latter.

Policy on higher education lies within the authority of the Ministry of Education and Higher

Education (MEHE 2016). This authority is mandated through laws and regulations that are based on the higher education legislation, which goes back to the 1960s and was revised and amended in 1996. The 1961 law established the Council for higher education, which has the prerogative to license new higher education institutions. On the other hand, the Lebanese University is self-governing and has its own autonomous structure. The MEHE operates and regulates the sector through two standing committees, the first is the Technical Committee and the second is the Equivalency Committee. These committees are in charge of regulating, more or less, the quality assurance aspects of the higher education sector in respect to licensing, auditing, and institutions/programs of study validation.

In 2002, and undoubtedly in response to the intense proliferation and expansion of private universities, the Directorate General for Higher Education (DGHE) was established as part of the Ministry of Education and Higher Education in order to regulate the private higher education sector and supervise, maintain, and coordinate all actions related to it. As such, the DGHE is the government entity in charge of the aforementioned private higher education institutions in Lebanon.

## Need for Reform and Quality Evaluation

### Accountability, Public Interest, and Internalization of Higher Education

The rise in the number of private universities in Lebanon, of which only a small part are openly declared as nonprofit institutions, has led to concerns on the quality of education they provide. Lebanon is in dire need of proper ways to ensure that it will maintain its regional reputation as a quality provider of higher education. Demands for accountability and assurances of the quality of the Lebanese higher education system have now increased within the institutions of higher education themselves and among the public, the employers, and policy-makers alike (Kaissi et al. 2008).

The ever expanding and globally diverse systems of higher education bring to the forefront the challenge of quality and quality assurance. In regional contexts and within individual countries debate is continuing on the role and form of quality and quality assurance for higher education. In the case of Lebanon, the practice of a system of external examiners or the more formal and institutionalized independent quality assurance authority are absent, which is only now being addressed in the form of draft law for the Lebanese Agency for Quality Assurance (MEHE 2016).

Within the Lebanese higher education context, accreditation is fairly new, but nonetheless the accreditation trend has recently picked up pace, and out of the 47 private competing institutes of higher education, a small number of universities has already acquired, or are in the process of acquiring, professional accreditation from international accreditation providing agencies such as AACSB, Accreditation Board for Engineering and Technology (ABET), Open University Validation Services (OUVS), and others. Although the vast majority has not yet been involved in such demanding processes, the majority is feeling the pressure. This comes at a time when government and regulatory boards stress issues of quality and reform within the Lebanese higher educational system and where public bodies – employers, parents, students, and society – have become more aware and even more demanding of the need for notions of quality and accreditation. Moreover, the huge competition among these universities and their vast diversification, manifested in the university reputations (prestigious or newly established), educational models (American, French, British, or other), nonprofit or profit seeking, and their academic affiliations with other universities (international, regional, or solely local) have started raising questions among stakeholders of higher education. For example, what makes a university better? How can a university's worth and quality be established? Does accreditation serve such a purpose? Does it effectively affect quality? The research literature does not provide direct answers to these questions although it is

now commonly deemed by the public and the universities themselves as a differentiator of quality and a stamp of approval to a university's worth. The race for acquiring accreditation in the Lebanese higher education community has been increasing while the concept of accreditation and its applications still leaves many questions unanswered all of which, accreditation and its associated questions, need answers, thus inducing further enhanced the scholarly interest into studying the specifics of accreditation.

Kaissi et al. (2008) identify several factors that affect the Lebanese higher education system such as globalization as manifested in regional cooperation, trade agreements, and demand for technology development, which increased the international exchange of resources with the region including human capital. The accelerating globalization of higher education, with international and cross-border providers of higher education acting as major players, rendered the need, to develop frameworks for quality assurance and international recognition of awards and qualifications, has never been so important. The authors (Kaissi et al. 2008) believe that these factors are affecting the Lebanese higher education system and pressuring it to make sure that its awarded qualifications are internationally competitive and recognized by the international labor market.

The human resource is Lebanon's most competitive asset and as such, it should be the country's main priority to enhance human capability by vocational training and education. However, the education sector suffers weakened public management due its low institutional capacity, efficiency, and quality (EURO-MED Partnership 2006). The Lebanese education sector also suffers from continuous migration from the country of youth and middle-class, and by high unemployment and low confidence in equal access to economic opportunities (Euro-Med Partnership 2006). Despite these aggravating factors, the private education sector has had positive influence on Lebanese education by attracting competent skills and resources in teaching and administration. Moreover, the national expenditure on education is relatively high (9% of GDP) and mainly due to private sources, which comprise 60% of this expenditure. Adult literacy has increased from 65% in 1972 to reach 85% in 1997, primary schooling is almost universal, net enrolments in secondary education are around 50%; post-secondary enrolments are around 25%, and gender differences are not particularly significant (Euro-Med Partnership 2006).

### Attempts at Reform

The aforementioned challenges establish the need to further develop the higher education sector. The government recognizes the shortcomings in the education system, and has launched a number of reforms, that have been manifested in several reform projects and one decreed law and two draft laws currently being considered by the Ministry of Higher Education:

- The law for organizing the private higher education sector (law #285) which was passed in 2014
- The draft law for creating the Lebanese Agency for Quality Assurance
- The draft law for restructuring the directorate of higher education in the Ministry of Higher Education

Other reform projects pertain to developing an information system in support of the national education strategy, reforming the administrative capacity of education strategic planning, rationalization of teaching staff management, and improving teacher training/inspection and counseling/examination and evaluation (Euro-Med Partnership 2006).

The Ministry of Higher Education has declared that the reform of the Lebanese higher education system and in particular areas of improving quality of this system sits high on its agenda (Higher Education Strategic Plan: Documentation of Ministry of Higher Education, DGHE, 2007/2008).

In addition, the area of reform of higher education and particularly the emphasis on quality assurance in the Arab world and particularly in Lebanon has been established as part of the EU country strategy paper (Lebanon 2007–2013) (EC 2012), and part of the recommendations of the World Bank (MENA Development Report,

"The Road not Travelled"), Education Reforms in the Middle East and North Africa (World Bank Publications 2008), and with the recommendations of the conference of Arab ministers of Higher Education in Dubai 2007.

Kaissi et al. (2008), in a project that was funded by the Trans-European Mobility Scheme for University Studies (Tempus), attempt to highlight the European experience in the field of quality assurance and to exemplify, within the Lebanese higher education context, the benefits and challenges linked to the development of quality management in higher education. TEMPUS aims to create an area of co-operation and support the modernization of higher education in countries surrounding the European Union in contribution to the globalization challenge facing higher education institutions (TEMPUS 2012). The aforementioned project, named Quality Assurance for Higher Education in Lebanon (QAHEL), investigates several QA models that have been used in Europe, from participative models to more centralized approaches, providing an opportunity for Lebanese higher education institutions to become aware of the existence of quality assurance systems and allow them to benefit from it. The project and its outcomes are of special interest to this research and thus will be elaborated in the following.

The project puts forth specific goals, namely, to the development of three guides in quality assurance for higher education, train Lebanese academics in the field, and support universities to establish their own institutional quality assurance units. A steering committee for the project was formed, and it devised the following approach to achieve the above. The first step was to evaluate "quality in Lebanon" through a closed-ended questionnaire, which was developed by the steering committee, covering the following issues in quality: "mission statements, goals, program planning, student admission, academic appointments, academic staff appraisal, support services, research, self and external evaluation, benchmarking, governance, non-academic quality issues (attractiveness of campus, positive attitude of staff. . .)." The questionnaire also included open-ended questions with two main objectives. The first is to identify other important quality assurance mechanisms and procedures that respondents think are important for the Lebanese higher education sector (not included in the questionnaire), the second is to identify the problems and gaps facing the Lebanese universities in the field of quality assurance. The findings of the questionnaire showed important problems and gaps in the system. The lack of laws, national agency, national standards, and guidelines for quality assurance processes and lack of accreditation procedures were mentioned by 62.5% of responding universities. Other findings included lack of understanding of the quality assurance system, the political and sectarian interference, lack of faculty and staff development, lack of adequate library facilities, and lack of cooperation and coordination. The second step in the approach of the project was to develop three guideline documents, which provide advice on standards and performance indicators for the Lebanese universities. The document covers the areas of quality and quality management, self-evaluation, and quality audits and accreditation for higher education institutions. The guides attempted ". . .to safeguard and promote public confidence in the quality of higher education in Lebanon, assist institutions in enhancing the quality of their provision, ensure that there is clarity and transparency in quality assurance processes and outcomes, and provide a measure of accountability."

The project concludes by highlighting the "urgent need to enhance the quality of the Lebanese higher education system and to establish a Lebanese National Quality Assurance Agency," the agency, as Kaissi et al. (2008) describe it, is expected to play key functions in enhancing higher education quality in Lebanon:

- Setting criteria for higher education standards based on the QAHEL outcomes;
- Promoting and disseminating good practice of quality assurance in higher education in Lebanon;
- Assessments related to the initial opening of programs and institutions;
- Supervision of the current functioning (institutions/programs)

- Granting accreditation
- The dissemination of information on the recognition and accreditation status of both institutions and programs

The project concludes with the need for higher education stakeholders (higher education institutions, students, teachers, researchers, professional bodies, and employers. . .) to agree on the scope of work and a set of guidelines for such a future national agency that can provide both a reference framework and a total approach to quality in the Lebanese higher education sector. It would provide a system of standards and indicators for the Lebanese higher education sector, as it progresses, through self-improvement, towards international best practice.

## Synonyms

Cyberlaw, e-law; Electronic government, e-government

## Definition

Public administrative organizations: Government organizations that are responsible for executive functions, actions, and policy (Appleby 1947).
Cyberlaws/e-laws: A series of laws designed to specifically address the requirements and restraints placed on e-government and e-commerce entities (Otenyo and Lind 2011).
Compliance: Fulfillment of external laws and regulations.
Digital signature: Electronic validation technique used to authenticate and validate digital documents.
Electronic government: The use of information and communication technologies to deliver public services (Holmes 2001).
ICT: Information and Communication Technologies.

## Introduction

The increased use of Internet-based technologies and information and communication technologies (ICT), such as broadband, e-mail, fiber optics, text messaging, 4G, search engines, teleconferencing, and Wi-Fi, has been advocated as a vehicle to reform public administration. The goals of the reform, to make public administration "better and more efficient, effective, responsive, and

lean," rely on what has been coined as e-government, or use ICT to deliver public services (Otenyo and Lind 2011, p. 105).

The use of ICT in public administration is not particularly a new concept. As early as the 1970s and 1980s, computers were used to assist in administration, albeit in simplistic forms such as word processing (Groothuis 2007). In more recent years, technological innovations have increased the capabilities of administrative organizations. Internet and e-mail applications have allowed citizens to increase communications with government entities in ways not previously possible. For example, a recent Pew research study found that more Americans are using ICTs to access information, ask questions, and receive government services online (Pew Internet and American Life Project 2010). In many cases, physical documentation and communication are being phased out in favor of the efficiency of the digital age.

However, these conveniences do not change the obligations of public administrative bodies to adhere to the rule of law. Like its physical predecessors, digital data can be considered sensitive or private. Unlike physical documents, digital data can potentially be accessed externally. A poignant example of this is the organization *WikiLeaks*, which claims to have a database of more than one million leaked diplomatic and military documents. Their July 2010 release of 76,900 documents related to the war in Afghanistan prompted considerable public concern regarding the safeguarding of digital governmental information. It is the responsibility of public administration entities to ensure the data is protected, and it is only accessed and altered through authorized means. To ensure that these agencies are held to a sufficient standard of security, as well has to hold them responsible for abuses of sensitive data, additional legal constraints outlining the use of ICT and the associated data have been placed on public administration. For example, On December 17, 2002, the E-Government Act was enacted. The legislation was designed to address prior shortcomings of the federal government and improve the management and development of Internet-based technologies and information and communication technologies (E-Government Act 2002). On the other hand, open and transparent decision-making is crucial to the accountability of governmental officials. It is on this basis that the Freedom of Information Act (FOIA) of 1996 was passed. This balancing act between protecting information necessary to the security of the nation, protecting the rights of individuals to have privacy, and making information regarding the accountability of governmental decision-making more transparent underlies the legal challenges to Internet-based technologies and information and communication technologies in public administration.

## What Is Cyberlaw?

Actions of public administrative entities are largely controlled by existing constitutional and regulatory laws. These laws serve as the framework for creating regulations that address new areas of concern, such as the development and implementation of ICT in public administration. Cyberlaws, also referred to as e-laws, are a series of laws designed to specifically address the requirements and restraints placed on e-government and e-commerce entities (Otenyo and Lind 2011). The purpose of cyberlaw is twofold. First, cyberlaws are meant to establish procedures and requirements for the use of ICT in order to protect and secure sensitive and personal data. Five areas of concern have been of particular interest in the development of cyberlaws: the regulation of information processing, regulation of information transmission, regulation of content, governance of secrecy protocols and personal data protection, and directives indicating the form of information (Otenyo and Lind 2011).

Second, cyberlaws establish boundaries on the use of ICT by government agencies in order to prevent violations of constitutional rights. Admittedly, some cyberlaws have actually expanded the powers of these agencies and are controversial due to the perception that they infringe on the rights of citizens. One such example is the Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act of 2001, colloquially known as the

Patriot Act. The Patriot Act greatly expanded the surveillance capabilities of federal law enforcement and intelligence agencies, authorizing the electronic monitoring of citizens in the name of national security (US PATRIOT Act 2001). In addition to concerns of overstepping the bounds of constitutionality and privacy, it has also been argued that the overdevelopment of cyberlaws can become a hindrance on e-governance and the benefits it could potentially provide.

## Examples of Cyberlaws

Cyberlaws can be implemented at the state or federal level and vary in their scope and purpose (Otenyo and Lind 2011). For example, some of these laws are designed to specifically address the activities of individual government agencies. On the other hand, some cyberlaws are designed to set standards and requirements for all agencies. Other cyberlaws were created to supplement prior legislation, using the original law as a framework while elaborating on new requirements that take ICT into consideration. The following section outlines several federal cyberlaws that have a direct effect on the operation of public administration. While this is not an all-inclusive list of federal cyberlaws, the selected legislations illustrate some of the challenges faced by public administration in regard to information technology and ICT.

As previously indicated, the E-Government Act of 2002 was designed to address prior flaws in the development, maintenance, and implementation of ICT in conjunction with federal agencies (E-Government Act 2002). Within the E-Government Act, two other significant pieces of e-law legislation were also enacted: the Federal Information Security Management Act (FISMA) and the Confidential Information Protection and Statistical Efficiency Act (CIPSEA). FISMA focuses on the security of federal data and information systems. Within the text of FISMA, information security is defined as "protecting information and information systems from unauthorized access, use, disclosure, disruption, modification, or destruction in order to provide. . .integrity. . . confidentiality. . . availability" (FISMA 2002, p. 2947). The law concerns all information systems operated by agencies in the legislative and executive branches of the federal government. In order to remain in compliance with FISMA, all federal agencies are required to develop, document, and implement programming designed to establish security procedures and protocols to protect agency assets and operations. These requirements also extend to cover ICT systems and data provided or managed by third parties on behalf of a federal agency. In order to receive certification and accreditation, system managers are required to complete an inventory of the information system, categorize the systems based on risk level, develop and implement security controls, conduct a risk assessment, and develop a security plan. Following accreditation, monitoring of the system continues, and the process repeats (FISMA 2002).

Compliance with FISMA is costly and time consuming, and the responses to the law are mixed. Advocates argue that the law created a legitimate framework for the management of information security. Opponents of the law argue it is far from perfect. Two of the largest areas of concerns are the issue of user complacency and the measurement instrument for compliance. Agency managers may consider the requirements as a checklist that needs to be completed, rather than considering the actual purpose of security. The requirements for compliance do not help alleviate this mindset, as compliance only requires the development of a security plan. There is no consideration for the effectiveness of the plan (Jackson 2007, 2009).

As alluded to before, some cyberlaws target specific types of data or specific agencies; CIPSEA is one such law. CIPSEA was enacted to establish uniform policies across federal statistical agencies, such as the Bureau of Labor Statistics, the Bureau of Economic Analysis, and the Census Bureau. The policies specifically concerned confidentiality protections for statistical data and allowances for information sharing between these bureaus. The law was designed to address concerns of citizens and businesses, who had become reluctant, or even hostile to the idea of participating in federal statistical surveys

(CIPSEA 2002). This concern is legitimate. Journalist Joab Jackson illustrated the two sides of this issue in an example concerning the energy department and energy companies. In order to remain competitive, companies must keep trade information secret. Alternatively, the energy department needs statistical data on energy use trends (Jackson 2004). The federal perspective was addressed in Subtitle A of CIPSEA:

> Declining trust of the public in the protection of information provided under a pledge of confidentiality to the agencies adversely affects both the accuracy and completeness of statistical analyses. . .Ensuring that information provided under a pledge of confidentiality for statistical purposes receives protection is essential in continuing public cooperation in statistical programs. (CIPSEA 2002, p. 2965)

CIPSEA was designed as a form of legal reassurance to citizens and businesses that all data collected by these agencies would not contain identifying information and the data would be used for statistical purposes only unless informed consent was obtained (CIPSEA 2002).

Another benefit of cyberlaws is the possibility of increased transparency of government agencies. Some laws were already in place to serve such a purpose and became the framework in which cyberlaws have been developed. The Freedom of Information Act (FOIA) was initially established in 1966. The law outlines mandatory disclosure procedures for requested information and documentation controlled by the US government as well as establishes exemptions to the law (FOIA 1966). As a result of the expansion of ICT, the Electronic Freedom of Information Act (E-FOIA) of 1996 amended the original law: all records created after November 1, 1996 must be made available through electronic means. Additionally, the law required that all agencies publish indexes from 1967 and beyond, which had already been required in a physical format, electronically no later than December 31, 1999. Due to the added administrative strain such requirements added to agencies, the response time for request completion was extended to 20 days (E-FOIA 1996). In the years immediately following its initial implementation, compliance with E-FOIA was problematic. Specifically, agencies were struggling to transfer the significant amount of records to electronic formats while also maintaining and responding to new FOIA requests, especially with a lack of additional funding, staff, and resources (Dat' 2000). This is not an uncommon issue in regard to the difference between legislation in theory and in practice. Leslie A. Jensen, a FOIA specialist, summarized the issue overall, stating, "E-FOIA overall is a good thing. But it is the same old story. In my opinion, Congress sometimes mandates without giving funds. I think we've done well in E-FOIA given the constraints in funds" (Dat' 2000, n.p.).

As mentioned before, one of the areas of interest when developing cyberlaws concerns the form information can take. More specifically, such laws may address the legal validity of digital documentation. The Electronic Signatures in Global and National Commerce Act of 2000 (ESIGN Act) specifically concerns the validity of digital signatures used during financial transactions in the private sector. The intent of the ESIGN Act was to ensure that a signature could "not be denied legal effect, validity, or enforceability solely because it is in electronic form" (E-SIGN Act 2000, p. 464). Ultimately, these records were to be considered legally equivalent to the signature in physical documents. Interestingly, government entities do not fall under the purview of the ESIGN Act. The ambiguity of confirming identities through ICT brought the validity of digital signatures in e-government into question. In order to ensure that a digital signature is valid, and therefore legally binding, e-government infrastructures have a few options. First is the use of public key infrastructure (PKI), a security architecture that uses cryptography to authenticate digital information as well as ensures the security of the data transmitted. Other options include, but are not limited to, identification by PIN or password, knowledge-based authentication, biometrics, and digitized images of physical signatures (Otenyo and Lind 2011). These cyberlaw examples illustrate how the law must keep pace with the ever-evolving attempts of ICT to enhance the privacy, security, and performance of public administration technologies (Milakovich 2012).

## Impositions on the Use of IT in Public Administration

Federal and state governments may also use other methods of controlling how ICT and the related data are implemented. Government agencies may place impositions on public administration entities. Unlike legal controls, conforming to government impositions is not required, though there is a reward for compliance. Compliance with guidelines, often referencing the use of ICT and the availability of data, is required in order to receive grants or other financial benefits. Alternatively, legislation both establishes a legal requirement and holds the secondary benefit of ensuring the accountability of agencies that violate these laws.

## Conclusion

As with most bureaucracies, the shift to digital governance has been slow-going, though the reality of digital age is irrefutable. With that considered, it is no surprise that public administration is continually being subjected to an ever-changing world of legal challenges regarding the implementation and protection of information systems and ICT. Each legislation comes with its own hurdles. Some requirements are not well planned, such as the FISMA compliance standards or the lack of resources offered to ensure compliance of E-FOIA. While these laws can be considered as overbearing and can constrain the effectiveness of e-government, they do address real concerns about the risks these technologies created. Without proper security and data management protocols, personal information has been compromised and abused. These laws also help increase government transparency and reduce secrecy. Alternately, some laws were developed to allow such behavior legally by the government in the name of national security. The point, however, is that information technology is a tool that is equally useful and dangerous to public administration. As a result, legal guidelines are a necessity.

Judicial ethics; Legal responsibility; Professional responsibility

## Introduction

Legal ethics are the ethereal bond that enables the judicial system to render peaceful disposition of societal conflict. The ultimate legitimacy of the legal system is dependent upon the perception by the society it serves that it is a fair process achieving just results. This requires that the legal process be founded upon ethical standards for the conduct of the participants and procedures. There is no legitimate legal system without legal ethics.

Legal ethics are important to maintain the integrity of the system and public support for the process and its outcomes. Society is dependent on the peaceful determination of legal disputes for its civil operation. Rather than relegating disputes to be resolved through the exertion of force or deceit, a legal system founded on ethical conduct engenders the public trust necessary for acceptance of the peaceful proceedings and the resulting outcomes. Devoid of ethical underpinnings, the judicial system would have no such support and thus collapse as a public institution.

The principles of legal ethics are implemented by defining the permissible conduct of attorneys relative to the other participants in the legal system. These participants are the clients, the courts, and third parties tangentially in contact with the legal process. The ethical governance of these relationships is the ultimate preservation of the integrity of the process and its legitimacy to society.

Virtually all of the interactions among attorneys and the participants are beyond the direct oversight of any controlling authority. Instead, the propriety of the interaction is self-regulated with guidance and direction by the permissible parameters of legal ethics. These ethical standards are implemented by the professional rules set for attorneys. As opposed to the clients and third parties, the attorneys are trained in the law, knowledgeable in the ethical parameters, and subject to professional discipline for any violations of those standards.

The principles of legal ethics, intended for societal support of the justice system and enforced by defining and regulating attorney conduct, also seek to address the interests and needs of the individuals in the process. Freedman and Smith assert that the concept of individualized justice embraces two concepts – respect for the individual in light of his circumstances and the control of the individual over important life decisions (Freedman and Smith 2016). These concepts combine to comprise the foundation for the adversarial system for the purposes of individual justice (Freedman and Smith 2016). These are the principles that are at the core of legal ethics.

## Operation of the Rules of Legal Ethics

The ethical standards for the legal process are the product of professional adoption of the generally accepted rules. These rules are intended to meet the societal needs for the legitimacy of the process while preserving respect for the individual in the process and their control over important decisions.

The rules are subject to formal adoption by the controlling professional body as the overriding

ethical principles for the governance of conduct. Just as the success of the judicial system requires public belief in the integrity of the process, the ethical rules for conduct require a mandate of the professional constituents. That acceptance is the requisite for consistent compliance.

The adopted ethical standards provide an overarching framework of guiding principles. Ethics, in general, are the principles that guide conduct in the absence of direct supervision. It is said that integrity is what you do when no one is watching. The overarching framework of legal ethical principles provides direction for conduct for professional self-supervision.

The infinite variety of potential possibilities of ethical issues confronting the practitioner precludes a definitive code of reference for specific application to every conceivable situation. Legal ethics remain an exception in an algorithm-guided society. Each situation requires individual judgment founded on guidance of the ethical rules. The practitioner must determine the course most consistent with the framework and proceed in ways that are consistent with those principles. The further the issue diverges from the framework, the more challenging the choice of action by the practitioner.

The challenge is further accentuated by the conflict between ethical rules founded on competing principles. These frequently arise when considering the conflict between the interest of society, such as a just outcome based upon complete consideration of the truth, and respect for the individual, such as confidentiality. Navigation through these ethical conflicts is the circumstance that is most difficult to resolve for those engaged in the practice of law.

## Governance of Legal Ethics

The rules for legal ethics in the United States have been established by a private organization, the American Bar Association ("ABA"), rather than by Congress or state legislatures (Freedman and Smith 2016). The Model Rules of Professional Conduct were adopted by the "ABA" House of Delegates in 1983 (ABA 2016). Before this, legal ethics were guided by the "ABA" Model Code of Professional Responsibility that was adopted in 1969 (ABA 2016). This model was the successor to the 1908 Canons of Professional Responsibility (ABA 2016).

While intended to promote and protect the underlying principles needed for societal respect for the judicial system, ethical rules have been reflective of contemporary societal and professional mores as well. For example, Freedman and Smith state that the 1908 Canon of Ethics was not motivated by a desire to regulate the bar, but were a reaction to mass immigration that peaked in that year, intended to preserve the practice to those who were native-born, white, Anglo-Saxon, Protestant monopoly (Freedman and Smith 2016). More recently, ethical prohibitions against attorney advertising as being degrading to the profession have given way to a contemporary acceptance of the practice as a first amendment expression. Today, the rules of legal ethics are confronting the challenges of social media in society. These include the attorney's use of social media for communication and promotion as well as the parameters of permissible access to the social media content of legal adversaries.

Rules for legal ethics are adopted on a state-by-state basis by the applicable state authority. Each state guideline is founded on the "ABA" Model Rules. However, the product of this ethical federalism is variations of individual states ethical rules differing from both the Model Rules and those of other states.

Just as the each state decides the specifics of its governing ethical code of legal conduct, so too do they determine the methods of enforcement. Most states establish a legal disciplinary board charged with the responsibility and power to enforce the rules and determine sanctions for transgressions. Discipline is determined after a hearing to afford the accused with due process. Disciplinary penalties include written sanctions, suspensions, or the ultimate penalty of disbarment.

## Rules of Legal Ethics

The ethical rules address the relationship of an attorney with the multiple participants with whom he interacts – the client, the court, and

third parties. Each constituency presents particular needs for the attorney to address. The ethical challenge arises in the interface between these constituencies.

## Rules of Legal Ethics as to the Client

The client is pre-eminent in the consideration of legal ethics. Hazard states that the relationship between the lawyer and the client is at the center of the law of lawyering (Hazard Jr et al. 2016). The ethical provisions are predicated upon the protection of the client interest within the framework of the legal process. The integrity of the judicial system begins with the belief of the participant that their needs and interests will be addressed in a manner that is fair and just.

The mainstay of legal ethics is the confidentiality of client communications. It all starts here. A client's security that their communications will be held in confidence is the predicate for full legal representation based upon the consideration of all of the facts.

The law is a fact-driven profession. A legal determination is dependent upon the application of the law to the specific facts of the case. In the absence of confidentiality, a client would hesitate to communicate the pertinent facts with full candor and completeness. The concept of confidentiality is vital to providing full representation to the individual. The ability of the attorney to provide wise counsel requires the client to fully provide information, even if embarrassing or incriminating (Freedman and Smith 2016). The potential result of incomplete conveyance of the facts is a deprivation of full representation.

The ethical rules providing for confidentiality in the legal process are tantamount to that of a doctor's or psychiatrist's patient's ability to present the history and symptoms needed by the professional to render a diagnosis and the proper treatment. In both the legal and medical contexts, the vital importance of factual completeness to the professional mandates a protection of confidentiality as a core ethical principle.

Confidentiality is also important as a fundamental expectation of the public. While they may not be fully versed in the particulars of the rule, the public is well aware that confidentiality is at the heart of the attorney-client relationship (Hazard Jr et al. 2016). The public perception of an attorney is that of "keepers of secrets" as much as being litigators, or advisors or draftsmen of contracts or wills (Hazard Jr et al. 2016). The ethical rules controlling confidentiality ensure that the profession meets those expectations. Confidentiality similarly results in a trust by the client which fosters an inclination in the client to accept the attorney's advice to do the right thing (Freedman and Smith 2016).

The "ABA" Model Rules provide that "a lawyer shall not reveal information relating to the representation of a client" in the absence of informed consent by the client, implied authorization necessary to carry out the representation, or exceptions enumerated by the rule (Rule 1.6a). Even inadvertent disclosure is precluded by the rules (Rule 1.6c).

The ethical protection of confidentiality is buttressed by the recognition of the attorney-client privilege by the rules of litigation. However, the ethical rule regarding confidentiality extends beyond the bounds of attorney-client privilege as the latter only protects against compelled disclosure and only as to communications between the client and the attorney (Hazard Jr et al. 2016). Again, the protection of client communications from disclosure in litigation is the same as that afforded to doctor-patient, psychiatrist-patient, and clergy-parishioner communications.

Hazard notes that the confidentiality often creates the tension as it exacts a sacrifice of the truth-finding and justice-seeking aims of the law generally (Hazard Jr et al. 2016). This balance is sought to be addressed by limited exceptions to the rule of confidentiality. These exceptions to client confidentiality are limited to prevention of the most severe societal harm (certain death or substantial bodily harm, commission of a crime or fraud reasonably certain to result in substantial injury to the financial interest or property of another, or to rectify or mitigate such financial injury), for the attorney to secure advice as to compliance with the ethical rules or determine a conflict of interest, to comply with a law or court order, or to establish a claim or defense in a conflict between the attorney and the client (Rule

1.6b). These exceptions are intended to address the conflict between the interests and expectations of the individual client and those of the judicial system.

The second ethical principle related to the client is the avoidance of conflict of interest. An attorney may not represent a client if the representation involves a current conflict of interest (Rule 1.7). Loyalty to clients is one of the core values of the legal profession, perhaps as vital as confidentiality and zealous representation (Hazard Jr et al. 2016). Just as the client needs unqualified assurance that he can freely communicate with his counsel, so too must he have no question that his interests are the attorney's sole concern. Institutional integrity is dependent upon the client not questioning whether his interests are being unfulfilled or even betrayed by the attorney's conflict with the interests of another.

A situation does not require an absolute or unquestionable conflict in the interests of the client or another. Instead, a conflict of interest refers to a situation where there is a reasonable possibility that an attorney will not be able to fulfill the legitimate demands of their time, attention, and loyalty (Freedman and Smith 2016).

The "ABA" Model Rules limit the exceptions to the prohibition against conflicts of interest to those instances in which the attorney believes he can represent the various clients, the representation is not prohibited by law, the representation does not involve the assertion of a claim by one client against the other, and "each affected client gives informed consent, confirmed in writing" (Rule 1.7b). Similarly, the "ABA" Model Rules prohibit attorney-client business interactions or resolution of multiple clients' civil or criminal actions in the aggregate (Rule 1.8). The prohibition of conflicting representation survives the termination of the attorney-client relationship with regard to the same or substantially related matters (Rule 1.9). The "ABA" Model Rules further impute a conflict to all members of a law firm if any of the attorneys are prohibited by the rules applicable to the conflict of interest in the absence of certain qualifying restrictions (Rule 1.10).

A third client-related ethical principle is that the attorney shall abide by the client's decisions as to the objective of representation and consult with him concerning the means by which they will be achieved (Rule 1.2). This applies in civil actions to the decision to settle and in criminal actions to decisions as to waiver of a jury trial, acceptance of a plea, or whether the client will testify. In addition to these core ethical provisions, the attorney's relation with the client give rise to other obligations (Rule 1.2a). This rule fulfills the previously discussed necessity that the system ensure client control of important decisions.

A client's involvement in the important decisions of his legal issues is of limited value in the absence of the client's possession of the information necessary to make informed decisions. Accordingly, the "ABA" Model Rules require effective communication by the attorney with the client (Rule 1.4). An attorney must explain a matter to the extent reasonably necessary for the client to make informed decisions as to his representation (Rule 1.4b). Additional rules as to client communication include the obligation to promptly inform the client of any decision or circumstance with respect to which the client's informed consent is required by the rules, consultation with the client as to the means by which his legal objectives are to be achieved, keeping the client informed as to the status of the matter, promptly complying with reasonable requests for information, and informing the client as to limitations of representations by the ethical rules (Rule 1.4a1-5).

## Rules of Legal Ethics: The Process

The rules of legal ethics similarly provide for protection of the process, the second of the tripartite elements of the judicial system. Just as the client requires confidence as to their individual interests predicated upon ethical principles, so too the integrity of the system is dependent on the legal ethical considerations as to the attorney's interactions with the courts.

The hallmark of the judicial system is the zealous representation of the client by the attorney. The client expects his attorney to prosecute his case and advocate for his interests to the fullest

possible extent. It is only when this occurs that the client has full confidence in the integrity of the legal system. However, an attorney's zealotry is not unrestrained. The prosecution of the client's interest is tempered by the considerations for the preservation of integrity of the process. These limitations preserve societal confidence in the integrity of the process.

The primary ethical principles that are protective of the process are the attorney's duty of candor to the court and fairness to opponents. Without either principle, the process degrades to a competition of untruthfulness. The result would be to undermine societal confidence in the system as a whole.

The attorney has a duty of candor to the tribunal (Rule 3.3). This duty goes beyond truthfulness in representation of facts and law. It extends to correction of prior misstatements, disclosure of controlling authority contrary to his position, and the preclusion from offering evidence known to be false (Rule 3.3).

The more challenging requirements of this rule arise from the tension between the requisite candor and protection of the client confidence. In that regard, if an attorney knows that the client or a witness has offered evidence known to be false or represents a client in an adjudicative proceeding that he knows is or has been engaging in criminal or fraudulent conduct, the attorney "shall take reasonable remedial measures" (Rule 3.3 (a)(3) and (b)). Such circumstances present the most taxing ethical challenges to the practitioner to fulfill the competing obligations to the client and to the process. The limited guidance to a practitioner by the rules is that the attorney may refuse to offer evidence, other than the testimony of a defendant in a criminal case, that the attorney reasonably believes is false (Rule 3.3(a)(3)).

The rules of legal ethics, protective of the process, similarly address the conduct of the attorney relative to the opposing party. These standards preclude obstructing the opposition's access to evidence, falsifying evidence, knowingly disobeying an obligation under the rules, making frivolous discovery requests, or alluding to a matter at trial that will not be supported by admissible evidence (Rule 3.4).

## Rules of Legal Ethics: Third Parties

As the attorney is traditionally viewed as a zealous advocate for his client interacting with those engaged in the legal process, both adversaries and courts, the existence of ethical standards for his interaction with both is expected. What is less obvious is the attorney's ethical obligation to third parties other than those he represents, to whom he is in an adversarial relationship, or the tribunal in which the legal matter is proceeding.

Freedman and Smith state that a premise of the adversary system is that one involved in a legal matter is entitled to have the benefit of a trained and skilled lawyer (Freedman and Smith 2016). The rules thus deal with two categories of circumstances – communications by the attorney with an individual who is unrepresented by counsel and communications with an individual who is represented by an attorney (Freedman and Smith 2016). The provisions of the rules are not restricted to those who are adverse to the attorney (Freedman and Smith 2016).

An attorney's interaction with third parties is subject to ethical constraints. The foundation of this interaction is the attorney's obligation for truthfulness (Rule 4.1). This obligation is to not make a false statement of material fact to a third person in the course of representation of his client (Rule 4.1(a)). Further, an attorney may not fail to disclose a material fact to a third person when the disclosure is necessary to avoid in assisting in criminal or fraudulent action by the client (Rule 4.1(b)). However, even this latter obligation is qualified by the obligation of confidentiality to the client as set forth by the "ABA" Model Rules. This again gives rise to ethical tectonic plates, bearing the force and pressure against the conflicting mandates.

In dealing with an unrepresented third person in the course of representing his client, an attorney may not misrepresent himself as being disinterested in the subject matter or even imply as much (Rule 4.3). Further, an attorney may not give legal advice to an unrepresented person other than recommend that he seeks legal representation (Rule 4.3). Among the purposes of this rule is to avoid the unrepresented individual's misconception of

legal representation by the attorney based upon providing legal advice (Freedman and Smith 2016).

Among the most clear proscriptions of legal ethics is the prohibition of an attorney from communication with a third party that he knows is represented by an attorney (Rule 4.2). The representation of the third person by the attorney must be known by the communicating attorney to be subject to the prohibition.

Other rules relating to this relationship provide that the attorney shall not employ means that are bereft of any purpose other than to embarrass, delay, or burden a third person or obtain information involution of that third person's legal rights (Rule 4.4).

## Conclusion

Legal ethics are the foundation of the acceptance of the legal process by individuals and society. The ethical rules are directed to attorneys to control their conduct relative to clients, the legal process, and third parties. The result is a self-regulated system that is the foundation of the legal justice system.

# Legal Issues in Nonprofit Management

Joseph Mead
Cleveland State University,
Cleveland, OH, USA

## Synonyms

Charity law; NGO law; Nonprofit law; Nonprofit policy

## Definition

Nonprofit management is the study and practice of running organizations motivated by a primary purpose other than profit-seeking. Legal issues of nonprofit management are those aspects of regulatory public policy that apply with unique force to managers of nonprofit organizations.

## Introduction

Nonprofits encompass a wide variety of organizational forms, purposes, and activities, and the full scope of legal issues faced by a nonprofit leader can vary widely depending on sector, structure, and country. Legal issues relating to nonprofit organizations fall into roughly three categories: organizational, tax-exempt, and operations.

## Understanding Nonprofit Legal Structure

There are several different forms nonprofits can take. The most common is the corporate form, which requires filing incorporation paperwork or obtaining a charter with a government office. A corporation is allowed to own property, sue and be sued in its own name, and exist permanently apart from any of its founders. In the United States, states manage the incorporation process and specify the rules that must be followed. As

long as the organization meets some minimal filing requirements, incorporation is a ministerial process without any discretion. Unless a nonprofit seeks tax benefits (see below), the reporting requirements for simply existing as a nonprofit corporation are typically pretty minimal in the United States. In other countries with a more skeptical public policy view on nonprofits, organizations are subject to extensive government oversight of their activities and may even be denied incorporation if the government determines the organization's goals or activities are counter to public policy.

Although the rules for nonprofit corporations are often similar to for-profit, or business, corporations, the primary difference is that nonprofit corporations are prohibited from sharing excess profits with insiders. One of the most common requirements for a nonprofit corporation is a board of directors or trustees who are responsible for governing the organization. The number and terms of board members are usually specified by the organization in their bylaws. Governments vary in the number of board members required – some allow just a handful, or even one, while others impose a much larger minimum size. The board is responsible for hiring and overseeing the chief executive officer, usually a paid position, who manages the staff and the day-to-day functioning of the organization.

Board members owe duties of care and loyalty to the organization. This means that each board member is legally required to make sure that they don't enrich themselves at the organization's expense and that they pay attention to the organization with enough detail to make good decisions about the organization's direction. For extreme bad behavior, board members can be removed from their position or held personally liable.

In most nonprofit organizations, new board members are selected by existing board members. This creates a self-perpetuating board. See entry: ▶ "Differences Between Nonprofit Agencies and Membership Associations." However, some organizations – for example, labor unions, homeowners' associations, and some advocacy organizations – are created with a formal, voting membership. Under this arrangement, members vote to elect board members and can vote to amend governing documents. Significantly, members are *not* owners or shareholders and do not have any claim to the organization's revenue, although they do have the right to certain types of information about the organization's activities. It is up to the organization to specify the qualifications of members. For example, members of a homeowner's association may be every property owner who pays dues to the organization, or an advocacy group may include anyone who has made a set donation over the prior year.

In many places, there is a distinction between "nonprofit" and "charitable," with "charitable" organizations being a subset of nonprofit organizations. "Nonprofit" generically refers to organizations which prohibit the sharing of surplus revenue or assets with members or owners, a prohibition sometimes called the nondistribution constraint. The nondistribution constraint allows payment of fair market salaries and contractual obligations, but does not allow for excess assets or revenue to be distributed to insiders in excess of fair market value. In many places, nonprofits can be created to pursue any lawful purpose.

"Charitable," in contrast, is a subset of nonprofit organizations that is designed primarily to pursue a purpose that is considered charitable. The definition of charitable has evolved through time and in part reflects country-specific preferences. To be charitable, the organization need not strive to benefit everyone, but it must benefit more than just a few closely connected insiders. In many countries, the articulation of charitable purposes is a descendant of England's Charitable Uses Act of 1601. The United Kingdom's 2011 statement of charitable purposes reflects a typical, modern approach:

(a) The prevention or relief of poverty
(b) The advancement of education
(c) The advancement of religion
(d) The advancement of health or the saving of lives
(e) The advancement of citizenship or community development
(f) The advancement of the arts, culture, heritage, or science

(g) The advancement of amateur sport
(h) The advancement of human rights, conflict resolution, or reconciliation or the promotion of religious or racial harmony or equality and diversity
(i) The advancement of environmental protection or improvement
(j) The relief of those in need because of youth, age, ill-health, disability, financial hardship, or other disadvantage
(k) The advancement of animal welfare
(l) The promotion of the efficiency of the armed forces of the Crown or of the efficiency of the police, fire, and rescue services or ambulance services (Charities Act 2011, c. 25 (Eng.), available at http://www.legislation.gov.uk/ukpga/2011/25/pdfs/ukpga_201 10025_en.pdf)

Depending on the country, advocating for policy change as a major goal can be considered a charitable purpose or can be flatly prohibited (Chevalier-Watts 2017; Salamon 1997).

## Nonprofits and Tax Rules: Exemptions, Benefits, and Subsidies

Certain categories of nonprofits are often given preferential tax treatment, including exemptions from corporate income tax, property tax, and tax benefits for individuals who donate to the organization. Specific rules vary by jurisdiction, but generally the nonprofit must prove to the satisfaction of the taxing authority that its mission is such that it qualifies for the exemption, that it is operated for the public benefit, and that it follows strict rules against distributing revenue or assets to insiders above a fair market wage. Jurisdictions differ in how stringent the review is. For a good summary of tax treatment of nonprofits between several different countries, see Dehne et al. (2008). For example, in the United States, many different types of nonprofit organizations are exempted from the federal corporate income tax, but only certain types of charitable organizations also receive the benefit of the charitable deduction, which can allow donors to the organization a benefit on their individual taxes.

Among the more rigid requirements for tax exemption are rules prohibiting personal benefit. Insiders are often limited in their ability to profit from the nonprofit's activities. In the case of staff, such as the executive director, the nonprofit can pay a fair market wage to employees but must be careful not to overpay. Having careful.

Even when nonprofits qualify for income tax exemption, they may still be taxed on commercial activity, such as selling goods or services to raise funds. Jurisdictions differ on which circumstances trigger such a tax. Some (such as Australia and Greece) look to the *destination* of the income and exclude income if the revenue is used to further the organization's charitable purpose. Others (such as the United States) consider the *source* of the income, taxing the income unless the commercial activity *itself* directly furthers the charitable mission. For example, a tax-exempt library that sells food off-site at a bake sale to generate revenue to support the library's operations would likely be taxed on that revenue in a jurisdiction that considered the source of the income, but not in a jurisdiction that considers the destination of the funds. Some nations contain specific rules for certain types of revenue, such as Finland's exemption of real estate income (Dehne et al. 2008). Across jurisdictions, donations made to organizations are typically excluded from the organization's tax obligations and may also come with tax benefits to the donor.

Tax benefits may come with restrictions on the organization's activities. In the United States, for example, federally tax-exempt charitable organizations are prohibited from engaging in political activity and limited in the amount of money that they may spend attempting to influence legislation. However, US nonprofits that are federally tax-exempt for noncharitable reasons – such as a 501(c)(4) social welfare organization, such as certain advocacy groups – have fewer restrictions on their political and lobbying activities.

Motivated by concerns of undue influence and hoarding large amounts of money, some nations have special rules regarding foundations, which are entities that have a primary mission of providing grants to other organizations rather than directly providing services. In the United States, for example, certain foundations are subject to

additional rules requiring a minimum annual distribution and more severe restrictions on lobbying for legal changes and engaging in transactions with board members.

Nonprofits that attempt to move donated funds from one country to another often run into serious legal issues, both in the nation of origin and the nation of delivery. From the perspective of the nation of origin, many jurisdictions desire to keep donated funds locally, particularly before granting a tax benefit to the organization. And several nations are deeply skeptical of foreign influence and tightly regulate the influx of foreign dollars, although these restrictions have tended to be relaxed in recent years.

## Legal Issues Raised by Nonprofit Operations and Activities

Finally, nonprofit organizations must navigate legal issues raised by any of their programming or activities. For example, health-care nonprofits must comply with numerous licensing, privacy, and standard of care rules related to their health-care functions. Common legal issues that many nonprofit organizations must navigate involve managing personnel (especially volunteers), regulations on fundraising, and limits on how revenue can be spent.

As with most employers, nonprofits will need to follow numerous rules about employee pay, safety, treatment, health care, hours, and rules prohibiting discrimination. Nonprofits have the additional challenge of managing volunteers, workers who provide labor without expectation of being paid. Unpaid workers can raise additional legal issues (International Federation of Red Cross and Red Crescent Societies 2011; Restall 2005). Although most nations allow nonprofits to accept donated labor, some impose limits. For example, some countries limit the number of hours a child can volunteer or prohibit people with certain types of criminal convictions from interacting with vulnerable populations.

One thorny issue is whether an unpaid worker is covered by laws applicable to employees, such as minimum wage or health-care rules, maximum hour limits, tax obligations, and safety or screening requirements, particularly if that "unpaid" worker receives certain types of benefits or compensation. For example, reimbursements paid for actual, out-of-pocket expenses typically do not create risk of the volunteer being considered an employee, but other types of compensation or financial gain to the volunteer may lend to classification as an employee, triggering rules such as wage, hour, and safety requirements. Moreover, in the United States, laws prohibiting discrimination or harassment on the basis of protected characteristics, such as race, sex, or disability, only apply to employees, which leaves volunteers uncovered. Some other nations, however, prohibit discrimination against volunteers through broader, more comprehensive anti-discrimination laws.

Nonprofits that seek to raise money by asking for donations may have additional obligations. In the United States, most states require nonprofits to register with a state authority before soliciting a contribution, whether by advertisement, email, phone, or in person. The nonprofit must provide specific information about their finances, how much is spent on the cost of the fundraising appeal, and certain information about board members. Other nations require similar public financial disclosures of all nonprofits, regardless of how they raise their revenue.

Nations often restrict nonprofits on how their money can be spent. First, money that is donated typically must be spent consistent with the donors' wishes. Moreover, a nonprofit must spend its assets consistent with its mission and not to support a wholly unrelated end. This also means that nonprofits may not spend money on activities that are illegal, although some nations allow nonprofits to spend money to advocate for changes to the law. Third, nonprofits may be limited in transferring money to another country, as nations prefer domestic spending. Finally, nations impose strict limits on supporting activities or organizations associated with terrorism, imposing severe criminal penalties or asset seizure for violations. Nonprofits are expected to carefully monitor spending outlays to ensure that all expenditures are approved via appropriate internal safeguards and are used to promote the organization's mission.

## Conclusion

As with any enterprise, the size and complexity of legal rules grows with the size and scope of the nonprofit organization. Different nations have different nuances in how each provision is interpreted and applied. As new policy choices and social realities emerge, the law governing nonprofit organizations will continue to evolve and mature.

# Legal Liability

Jason Hochstatter
Milwaukee, WI, USA
Illinois State University, Normal, IL, USA

## Synonyms

Accountability; Accountableness; Blame; Burden; Compulsion; Culpability; Debt; Duty; Indebtedness; Obligation; Onus; Owing; Subjection; Susceptibility

## Definition

Liability refers to money or debts owed or something disadvantageous.

## Introduction

Legal liability is a person's legal responsibility for something. This responsibility can be financial, such as the expectation that if you break something, you should pay for it to be repaired, or it can carry other costs, such as a prison sentence, community service, or even death.

Legal liability can be broken down into two types. Criminal liability is a person's responsibility to obey laws, and if a person breaks a law, they are required to pay the legally described cost of doing so (Cooter 1991). For example, if Jerry Jones gets pulled over for speeding, he may be given a ticket by the police officer and be required to pay a fine. However, if the police officer also searches Mr. Jones' car and discovers the pound of cocaine he was smuggling across the border, there may be more serious consequences in addition to the speeding ticket.

Civil liability is different than criminal liability in that criminal liability is typically between an individual and his or her government, while civil liability is typically between two or more individuals or businesses typically as a result of negligent actions. For example, if little Joey accidently hits a baseball too hard and breaks a neighbor's window, his parents' might be found liable for allowing little Joey to do that in a place where he could easily cause damage and be required to pay for replacing the window. If Zapco Motors makes a car with a faulty ignition that causes one of their sedans to explode upon starting, and this accidently kills Elizabeth Smith, then Zapco Motors could be found civilly liable for the wrongful death of Ms. Smith. Typically, individuals and businesses purchase insurance policies to protect themselves from civil liability.

The purpose of this segment will be to provide an overview of what liability is, the differences between criminal and civil liability, and the different ways that individuals and business attempt to mitigate it.

## Criminal Liability

Criminal liability becomes an issue when someone breaks a law that the state can charge them with a crime for, and they typically come with consequences that can range from financial penalties, to imprisonment, to death in some cases. It is a debt that a lawbreaker owes to the state. This section will cover what exactly liability is, when it is established, potential consequences that the state may impose, as well as ways that individuals may attempt to mitigate liability.

In some ways, criminal liability is like a disease. You can't see it, people may treat you differently because of it, and it stays with you, mostly unseen, until it is cured. You "catch" liability, or rather become criminally liable for something, by doing something against the law. If someone shoots a man in Reno just to watch him die, he has just become criminally liable for the crime of murder. The liability in this case is the responsibility to pay the state specified cost of breaking the law, and once paid, the person is no longer liable for that crime.

Last Tuesday, Jane Jackson was ticketed for jaywalking and she paid a small fine. When Jane jaywalked, she became criminally liable for the crime of jaywalking. When the police officer caught her and ticketed her, she was charged and assigned a punishment for her crime. Finally, when Jane Jackson pays her ticket, she is no longer liable for the crime of jaywalking.

Sometimes criminal liability can have lasting effects. For example, in some states, people who have committed crimes deemed to be felonies, or particularly serious crimes, are no longer allowed to vote. In these cases, those individuals are no longer liable for the crime they no longer committed, but part of their payment was that they are no longer able to vote.

There are some instances that someone can break without becoming criminally liable for them. Criminal liability primarily comes into play when the law specifically indicates that it should come into play. In these cases, it is possible that the person could still be civilly liable, even if they are not criminally liable.

A person must typically intend to break the law in order to be criminally liable for breaking the law. The court does not typically want to put people in jail for honest mistakes or accidents, so for many laws, there is a requirement of "mens rea," which is a Latin phrase meaning the law breaking must be intentional (Parker 1993).

James Walsh is driving home from work and runs a red light, causing a three-car pileup. James is found to be responsible for the car accident, but the police do not ticket him for damaging the other vehicles, because he did not intend to damage the other vehicles. The police officer does give James a ticket for running the red light, however, because James did know that by doing so he would break that traffic law. James will still be civilly liable for the damage to the other vehicles, as well as any medical bills that those people may have had.

Will Lawson is driving home from work, but he is pulled over and ticketed for speeding. Will believed that he had been driving the speed limit, because his speedometer never read above the speed limit. Will takes his car to the mechanic to check the speedometer, which they find to be faulty. Will may take this document to court to reduce the charge to having a defective speedometer, as he had no way of knowing that he was speeding.

Some crimes are considered by the court to be especially distasteful regardless of the circumstances, so there is a strict liability requirement (Cantu 2002). This means that no matter what the intent of the lawbreaker, they are still criminally liable for their actions.

In some states, statutory rape is considered to be a crime of strict liability. Tiffany and George have sex. Tiffany had asked George if he was above the age of consent, but George lied and said he was 21, even though Tiffany had reason to believe that George was above the age of

consent, she is now liable for statutory rape, because intent does not matter in this case.

The ramifications of a criminal offense may vary depending upon the severity of the offense, if the offender has previous convictions, and what the laws in the state dictate. Typical punishments might include a monetary fine, imprisonment, loss of certain privileges, or even death. Lesser offenses, especially nonviolent offenses, tend to be punishable by fine. Violent offenses, or offenses that could be violent, tend to be punishable by imprisonment. Crimes that are considered to be especially heinous might be eligible for the death penalty depending on the state.

Ben Johnson is pulled over for speeding, and he is issued a ticket. If Ben was only going ten miles per hour over the speed limit, he would typically be charged a small fine. If Ben was going forty or fifty miles per hour, he might be charged with reckless driving, or street racing, which may carry a higher fine, as well as restrictions about his driving privileges. Additional side effects not imposed by the court could potentially include increased premiums for Ben's auto insurance or even loss of his job if he is no longer able to get to work due to a lost driver's license.

Bethany Thomas is arrested for killing David Radkin. If Bethany kills David in a moment of anger during a fight, she would go to jail for it, but if Bethany planned to kill David and intentionally murdered him, then the state will be much harsher on her and potentially give her life in prison or the death penalty. In either of these cases, Bethany would likely be considered a felon, which would affect her ability to get a job, her ability to purchase a gun, and in some states her ability to vote.

Criminal liability is primarily mitigated by not committing crimes. Ignorance of what the law states is not considered a defense for committing the crime, so an individual needs to have enough knowledge of the law so that they do not commit a crime. It is common sense that it is against the law to murder someone or steal something, but frequently there are other laws that one might not think about. If John owns a house, he ought to know what local ordinances affect him as a homeowner, so that he does not violate them and become liable for paying a fine. Banks need to know all of the relevant laws about banking, so that the government does not impose fines or other penalties, making them less profitable.

## Civil Liability

Civil liability becomes an issue when an individual breaks a law that affects another person, but it may be something that the state does not get involved with. Civil liability can be seen as a debt that one person legally owes to another person (Cooter 1991). This section will cover what exactly civil liability is, when it is established, potential consequences that the state may impose, as well as ways that individuals may attempt to mitigate liability.

Civil liability is typically created when one person damages another person in some way. Property damage, bodily injury, copyright infringement, or breaking a contract are just a few ways in which civil liability can be created (Cooter 1991). Civil liability can even be created at the same time that criminal liability is created. In the well-known OJ Simpson murder case, Simpson was found not guilty at his criminal trial, but he was later found to be civilly liable for the death of his ex-wife.

John is an auto parts manufacturer and has agreed to deliver 500 wheels to Susan by Friday. They have signed a contract, and the contract outlines that if John fails to deliver the wheels by the deadline, he will have to pay a penalty of $500 to compensate Susan, because she is relying upon timely delivery of the wheels. The moment that John fails to deliver the 500 wheels on time is the same moment that he becomes civilly liable for paying Susan the $500 compensation.

Little Jimmy is playing baseball in the backyard, and he accidently breaks a neighbor's window with a fly ball. If Little Jimmy has the money for replacing the window, he may be made to pay for it, but it is more likely that Little Jimmy's parents will pay for the window, accepting liability for the actions of their son.

The potential consequences of civil liability are much more limited than they are with criminal liability. Unless a criminal act has also been

committed, things like a criminal record, jail time, and capital punishment are off the table. Typically, civil liability is limited to exchanges of money or goods.

Joan is walking through Steven's property when she unknowingly walks over an entrance to Steven's hidden underground cellar, and the door collapses. Joan falls in the cellar and breaks her leg. Steven neglected to adequately make the cellar entrance visible and neglected to ensure that it was safe should someone step on it. His neglect makes Steven civilly liable for Joan falling into his cellar, and because of this, the court decides that he should pay for any medical bills that Joan incurs as a result of falling through the cellar door.

Craig is renting a house to Richard for $1,000 per month. Unfortunately, Richard loses his job and is unable to continue paying his rent. Because Richard is now no longer paying his rent, he has now broken his contract. Craig becomes concerned that he will no longer be able to pay for the mortgage on his own house, and the mortgage on his rental property, and moves to evict Richard so that he can find a tenant who will be able to pay rent. The court finds Richard liable for not paying his rent, and it orders that Richard be evicted. While the eviction may not be a monetary cost to Richard, an eviction will go on his record and he may find it more difficult to find an apartment in the future.

While you can be both civilly and criminally liable for an act, intent is a major dividing line between civil and criminal liability. Criminal liability typically requires that the act is intentional, whereas civil liability does not; it typically only requires damages or neglect that causes damages. Damage typically considered to be some sort of harm that comes to someone due to someone's actions.

If James causes a car accident and accidently kills someone, he may not be tried in a criminal court because he did not intend to kill someone, unless the way the law is written in James' state is written differently, or if he is found to be criminally negligent. James may still be required to make a wrongful death payment in this case regardless of criminal liability because in causing the accident, he was found to be negligent.

It can be impossible to avoid civil liability. James cuts off Susan in traffic, and Susan can't avoid rear ending his car. The majority states assign fault to one person or the other in the event of an auto accident, even if both were at fault. Some states are considered to be no-fault states when it comes to auto accidents because blame is not assigned, and each party's insurance pays for their own damages, but these are rare. In this instance, most states would consider Susan liable for following too closely, even if James was driving dangerously. There are ways to avoid, mitigate, and transfer liability depending on the situation.

Avoiding liability is simply not doing something that could potentially make you liable for something (Dorfman 2007). If Will decides that he is a terrible driver, he may stop driving to avoid getting into a costly car accident. This is not always a viable solution, as many people need to drive to work and a business that is not putting itself at liability risk is not doing much business.

Self-insuring decides that there is an acceptable level of risk for what they stand to lose and simply plan to pay for it if that issue crops up (Dorfman 2007). A non-liability example is if I drive an old car that is about to fall apart, I may decide to accept the risk that if I get into an accident, I would be personally responsible for paying and for replacing it. This method is less common for civil liability because civil lawsuits can become expensive very quickly, and liability insurance is inexpensive.

Reducing the risk is taking actions that will minimize exposure to risk (Dorfman 2007). This is a commonsense approach to liability that boils down to not being negligent. In a previous example, where Joan was hurt by falling into Steven's hidden underground cellar, Steven could have reduced his risk by posting a caution sign or by having the entrance be in plain sight, rather than hidden. If either of these things were true, it would have reduced the risk of Joan accidently getting hurt, and in some cases, Steven would have a better defense if the issue does go to court.

The last method of managing risk of civil liability is to transfer the risk to someone else (Dorfman 2007). Insurance companies offer policies where they will take on your risk of civil liability. They

will pay for a legal defense as well as damages up to a limit set by the policy. This is often inexpensive coverage to provide, and broad liability coverage is typically included with all auto, homeowner's, renter's, and commercial insurance policies. Insurance does not typically protect against intentional acts, so if John smashes someone's windshield with a baseball bat, he is on his own.

## Conclusion

This chapter has attempted to broadly describe and explain the complex issue of liability. Risk management analysts, insurance companies, and lawyers all make their living off of interpreting the seemingly simple rules laid out here. Multinational corporations can have their profits decimated if they do not manage their risk properly. Individuals may face million-dollar lawsuits if they are negligent and may be sent to jail for the rest of their lives if they commit a crime. This overview is only meant to serve as an introduction into a vast topic.

# Legal Versus Ethical

Anna Simonati
Faculty of Law, Trento University, Trento, Italy

## The Relationship Between Lawfulness and Ethics: Preliminary Remarks

It is quite interesting – and perhaps surprising – that *ethical* and *legal* may be considered as opposite terms (MacKinnon and Fiala 2015; Lyons 1984).

If one looks at the origin of the legal phenomenon, in fact, there is a strict link with ethics (which, in the past, was expressed in the belief of the divine origin and legitimacy of sovereign power).

Anyway, there is clearly at least one main difference between what is legal and what is ethical. The concept of *ethical* has always to do with a voluntary choice of a person, according to his/her perception of good and evil (Huberts 2014). If something is legal, instead, this means that a decision has been taken by the lawmakers, in light of evaluations which are not (and could not be) individual, but must reflect a collective dimension.

An open issue regards the possible existence of a theoretical bi-univocal correspondence between ethics and law. In principle, as already pointed out, legal rules find their origin in moral commands and prohibitions. At the same time, following the rules in force should be, first of all, a moral duty for individuals, groups and authorities: which is the very soul of the principle of lawfulness. Therefore, between the two fields, there should be a sort of correspondence; the difference has essentially to do with the nature of the punishment for the breach of the ethic and of the legal rules.

But history teaches us that, during the centuries, several statutes have been emitted with contents that nowadays are considered nonethical. Just to mention some self-evident examples, in the recent past – and still, in some systems – slavery, racial apartheid, and discrimination

against women were and sometimes still are perfectly legal, notwithstanding, according to the most shared view, they are clearly nonethical.

The explanation for such a contradiction is double. From a side, legal rules – like all the products of human choices – may be wrong. From the other side, the cultural sensitivity is not still, and it has progressively changed. Even if a principle (for instance, equality) was generally accepted many centuries ago by the great majority of the legal systems, its implementation was deeply different in the various contexts (Beck Jørgensen and Vrangbæk 2011). The contradiction is possible also because ethics normally consists of guidelines, while legal rules also have specific content.

Another level of the possible contrast between what is ethical and what is legal may be grasped, especially in the field of public action. A legal discourse, when a behavior of an authority or institution is involved, postulates the protection of the interest of the whole community, which sometimes requires a sacrifice of the interest or view of a part of the population. Therefore, the question is as follows: is the prevalence of the public interest (which is normally pursued by the statutes) necessarily ethical? From this point of view, the problem of the complex relationship between lawfulness and ethics – in rule-making and in administrative action in strict sense – is particularly evident in some "sensitive" fields: for instance, let's think at human activities potentially impacting the protection of natural environment or public health, or at the distribution of scarce resources (like it happens in social housing and in urban law in general), or at the protection of minorities and "weak" parts of population through the introduction of affirmative measures (Rittel and Webber 1973; Scott 2009).

## Lawfulness, Ethics, and Legal Sources

In the system of legal sources, there was traditionally space – and, within certain limits, still there is space – for routines, which, if commonly shared in a community, may become legally binding: *diuturni mores consensu utentium comprobati* (Gaius). This shows that an ethical behavior, even if not imposed by the rules in force, may spontaneously become potentially legally enforceable.

The opportunity for customs to become real sources of law is nowadays normally admitted in the legal systems either when "positive" rules are completely absent or when their content is so wide to require a specification in order to be properly implemented.

However, there is not only this solution, in order to integrate a legislative framework which is not complete. Other tools may be used, particularly when administrative action is involved.

Sometimes, in fact, the statutes in force do not contain an exhaustive description of how administration should work. Therefore, if one looks only at the "positive" law, the "minimum necessary" level of accomplishment with the legal rules would be enough. On the contrary, if one looks at the legal system as a whole, it would be easily grasped that, from an ethical point of view, some principles of fair administration (to make two very different examples, the ancient *audi alteram partem* principle and the more recent principle according to which the final assessment of an oral test must be recorded) are self-executing and the compliance with them is normally compulsory.

Besides, especially from the point of view of good behavior of public servants, Codes of Ethics have started being emitted in the latest decades in many legal systems (Meine and Dunn 2013; Ochoa and Graycar 2016). The open issue about these tools is their legal value. Tendentially, one could infer that, if there is not an expressed reference to them in a legal source, they work as guidelines to implement best practices. However, they can help officers and employees in avoiding not only illegal but also unfair conducts, indicating the link with the general principles. They also have the function to create a sort of preventive consciousness about the ethical dilemmas that administration must face in its daily action, when the solution to concrete problems is not clearly or exhaustively indicated in the statutes in force.

Considering all these elements, one may infer that the possible contrast between ethics and

lawfulness has to be checked out very carefully. When a gap in the rules in force seems to suggest that – as not expressly forbidden – an action is implicitly allowed even if nonethical, it is necessary to look at the whole legal system. In fact, the prohibition of the nonethical behavior may probably derive from the general principles, notwithstanding they are not written or they are expressed in very wide terms.

## Lawfulness, Ethics, and Administrative Measures

The problem of the possible contrast between ethics and legality is mainly relevant, in the field of administrative action, with reference to the exercise of discretionary power. Discretionary power, in fact, requires public authorities to balance interests. The best solution for the single case is not directly indicated by the legislators; on the contrary, it must be found out by carefully identifying the dominant public interest. Approximately, one could say that it is the greatest good for the greatest number; however, the respect for minorities and dissenting voices is an ethical value, and consequently it has become a legal priority as well, as many statutes (especially about administrative procedures) in various legal systems at present show.

An important side of the relationship between ethics and lawfulness of administrative action regards the breach of the rules about the emission of administrative individual measures.

In this field, there is often a contrast between formal and substantial defects of the measures. Both, of course, make the act illegal, but they do not always produce the same effects.

According to some legal systems, an act cannot be declared void, due to just formal infringements of procedural individual rights. Moreover (and parallelly), if there is not a proof of a substantial breach of an individual interest, the act may not be declared void in presence of certain procedural irregularities. In such cases, the autonomous relevance of the public interest at the compliance with the principle of lawfulness is not enough to justify the elimination of the measure, which may be quashed only if there is a further interest to eliminate it. In other words, according to some legislators, a strict respect for the principle of lawfulness is inefficient and unfair (consequently – one could infer – at least partially nonethical), if it has just the consequence of compelling administration to repeat an institutional action, when no element of its result must change. So, when the breach of law regards rules about forms or procedure, the measure has just "formal defects" and it cannot be quashed if it is evident that its content should anyway have been the same. Of course, this normally happens when the exercise of the administrative power is completely bound by the statutes. Whenever there is discretionary power, instead, it is almost impossible for the competent authority to produce the required evidence of the substantial irrelevance of the legal breach.

Besides, when a discretionary power is involved, normally in the legal systems there is a settled rule, according to which its exercise is reserved to public administration. In other words, in light of the general principle of separation of powers, the court before which a measure has been challenged may not evaluate the specific content of the administrative choice. Judicial review regards, instead, only the respect for the procedural rules and the general principles of good administration (equal treatment, participation by all the private stakeholders, transparency, and so on). This means that, if the legal procedure and the "macro-principles" have been respected, there are often no judicial tools to compel administration to change a decision which is considered "just" wrong from an ethical perspective. Consequently, public authorities themselves should be carefully self-critical and open to change their opinion, either in front of an administrative appeal by the interested private party or ex officio.

## Lawfulness, Ethics, and Privatization of Administrative Action

Another aspect of the issue of the possible contrast between lawfulness and ethics is linked with the progressive involvement of (at least formally)

private subjects in the fulfillment of public interest. Because of their private nature, these bodies are often bound by (civil law) rules, which are partially different from the administrative law ones and require the compliance with fewer obligations.

This may make their action much more flexible and less expensive, with a possible violation of the principle of equality when they are involved in activities that are substantially the same than the ones held by the authorities. In such cases, the mere implementation of the traditional rules would produce an undesired unfair effect. Consequently, sometimes the legal systems themselves impose the assimilation of these bodies to public authorities. A typical example can be found in the European Union, where the legal concept of "body governed by public law" was created in the public procurement directives to avoid circumventions of the rules in force by the public entities of the member States, which at that purpose constituted totally ruled by private law companies. In the case, a supranational system introduced mechanisms to neutralize what was considered as a nonethic implementation of statutes by the national legislators.

Some other times, the involvement of private subjects in public interest activities can put in evidence another possible consequence of the difference between ethics and lawfulness. In particular, the implementation of spontaneous best practices is often easier for private bodies than for public authorities, because the borders of private freedom are wider than the ones of administrative autonomy. In fact, even if they are not compelled to do so, private entities sometimes hold virtuous behaviors, to pursue values of equity and substantial justice. An example is the voluntary implementation of anti-discriminatory practices by private corporations, especially to protect people belonging to minorities or other vulnerable groups. It is interesting to notice that these good practices, if frequently implemented, are able to become (first) soft law and (then) real binding rules. Such a result may happen when the best practice produces an efficient defense of the public interest and, consequently, it is requested to be respected as a preferential element to obtain public grants or favorable administrative measures. In this case, what is originally just ethical progressively converts into legal.

## Legal Vs. Ethical in a "Totemic" Tool: Short Remarks about Whistle-Blowing

With specific regard to administrative action, a particular instrument is important to mention, because it perfectly represents the possible tension between ethics and lawfulness: it is whistle-blowing in public bureaus.

Not all the legal systems rule whistle-blowing. It starts being encouraged by some legislators to overcome severe phenomena of maladministration; however, there are cross-cultural differences in the ethical perception of this tool, which is based on the dilemma of conflicting loyalties.

As it is well known, whistle-blowing is strictly linked with the theory of public service motivation (Ritz et al. 2016). Public officers who act as whistle-blowers are normally motivated by concern for the public interest; moreover, they are often high performers, and they report high levels of achievement, job commitment, and job satisfaction. Besides, they are likely to work in high-performing work groups and organizations.

This is very interesting, because it shows that a stimulating working environment substantially encourages public servants to overcome their possible moral compunctions for a superior (general) advantage.

However, whistle-blowing is not only connected with a conflict between different loyalties. In most cases, it has also to do with an illegal behavior which – as it is aimed at contrasting a third party's more severely illegal (and anyway unfair) behavior – is considered ethic. This clearly happens, for instance, whenever the whistle-blower has to disclose (first, to an authority and, then, probably to the public in general) confidential data.

This example shows that, notwithstanding it is a constant goal for rule-makers and administrative authorities to overcome the causes of contradiction between ethics and lawfulness, they are not totally erasable. Moreover, there are fields where

the legislative contribution may not be self-sufficient and the prevalence of one value on the other depends on a personal choice by an individual.

## Conclusion

Ethics and lawfulness are clearly strictly linked with each other. In principle, ethics should be, from a side, the basis for the legislative choices; from the other side, the full compliance with the legal rules in force should be a categorical imperative.

Notwithstanding this, in reality there is not between them a two-way relationship. The full respect for the statutes in force may sometimes produce the breach of ethic commands; sometimes there is a conflict among legal sources of different level and other problems are caused by the absence of clear and precise rules in certain fields. Numerous open issues regard the exercise of discretionary power, also because – especially at present, in our very complex and complicated societies – it is not simple to choose (first) what are the private positions to be sacrificed in the public interest and (second) what is, in comparison with the others, the main and prevalent public interest to be pursued. In this perspective, the greatest good for the greatest number is not always the best solution. It is also interesting to notice that sometimes the legislators realize that non-perfectly legal decisions may be coherent with ethic values; consequently, they make formal or procedural mistakes in the emission of an administrative measure irrelevant, denying the act to be quashed if it does not really infringe an individual interest.

When the solution to the single problem is not directly offered by the legal rules in force, the correct balance between lawfulness and ethics may be found either in a comprehensive vision of the legal system or in the implementation of best practices. These ones, in particular, sometimes progressively grow in importance (in light of their constant use with good results) and, at the end of a process of metamorphosis of their nature, become legally binding.

However, one must realize that the role of personal choices among different (and sometimes conflicting) values by public servants and other people involved in administrative decision-making cannot be eliminated, as the example of whistle-blowing clearly shows.

## Legislation and Policy for the Nonprofit Sector, Japan

Kyoko Ohta
Faculty of Law and Letters, Ehime University, Matsuyama, Japan

### Synonyms

Gray zone; Nonprofit sector; Public benefit; Public interest corporation; Specific nonprofit corporation

### Definitions

Overview of the recent legislations for Japan's nonprofit sector and the argument over the resulting institutional diversity.

### Introduction

In 2018, the Law Concerning the Promotion of Specific Nonprofit Organization Activities (the NPO Law), a monumental law for Japan's nonprofit sector was in force for 20 years. The mid 1990s when this law was promoted by citizens' groups and the political process unfolded was a watershed period for Japan's nonprofit sector or for civil society. This paper reports on a study of the characteristics of and challenges facing the legal system of Japan's nonprofit sector focusing on the period since the enactment of the NPO Law.

Many studies of Japan's nonprofit sector systems and policies have been dealt with themes such as the following:

1. The reasons for and background events culminating in the 1998 enactment of the Law Concerning the Promotion of Specific Nonprofit Organization Activities (the NPO Law), the NPO support tax system in 2001, and the revision to the NPO law in 2012. With particular focus on activities of international NGO since the 1980s, and activities related to the Great Hanshin Earthquake of 1995, and the following policy making process encouraged by citizens' groups (Kojima 2003; Matsunami 2008; Osborne 2003).
2. Reasons for and background events culminating in the revision of the public interest corporation system in 2006 (Okamoto 2015).
3. Regarding the relationship of NPO and public administration mainly in municipalities since the enactment of the NPO Law, concerning the actual state of the partnership with municipalities in individual fields such as welfare, environment, education and urban planning (Yasuhiko 2014).
4. International comparative research centered on quantitative analysis of the field of nonprofit organizations (Salamon & Associates 1998; Salamon & Anheier 1998).
5. Research on neighborhood associations (Pekkanen 2006).

The analytical perspective common to existing research that analyzed the characteristic of Japan's nonprofit sector from the viewpoint of international comparison in particular since 2000 has been based on historical institutionalism (Schwartz & Pharr 2003; Pekkanen 2006; Okamoto 2015). That is to say, the view that a unique legal system and critical functions of the state related to the nonprofit sector in a certain country have greatly influenced the formation of the characteristics of its nonprofit sector (Smith 2011; for a different perspective, such as "social origins" theory, see Salamon & Anheier 1998). But during the 20-year period beginning with the enactment of the NPO Law in 1998, the legal

system surrounding the nonprofit sector has itself been transformed. This paper gives an overview of the state of the system during this period at the same time as it organizes a new argument that has resulted from the transformation of this system. This new argument is, in short, over whether or not the nonprofit sector legal systems that have been increasingly diversified (or have become increasingly fragmented) by the NPO Law and by new public interest corporation system should be integrated into a single system in the future.

## Legislations for the Nonprofit Sector

This section overviews the two important legislations for the Japanese nonprofit sector: the establishment of the NPO Law and the reform of the historic public interest corporation system.

Events in the background to the process of the enactment of the NPO Law include the anti-pollution movement of the 1960s, environmental protection movements in various regions that developed later into the national trust movement, rising formation of corporate foundations in various fields since the 1970s, the following various philanthropic activities promoted by these foundations since 1980s, community-based welfare activities and the flourish of international NGOs. Another event often said to be an important trigger is the Great Hanshin Earthquake of January 17, 1995. In 1 day, 60,000 volunteers, and overall a total of 1.3 million volunteers took part. At the same time, however, the criticism was made of a systemic shortcoming of the efforts, namely, that almost none of the volunteers had corporate status (Amemiya 2002, pp 29–30).

In Japan, organizations must obtain the status of "legal person" (hōjin) to have legal standing. Although it is possible to operate without that status, groups lacking it cannot sign contracts as an organization, and that makes it impossible for them to do such things as open a bank account, own property or sign a lease for office space, or undertake joint projects with the government. The lack of legal standing may also deprive organizations of social recognition they would otherwise win (Schwartz 2003, p 10).

The Law Concerning the Promotion of Specific Nonprofit Organization Activities (the NPO Law) was passed unanimously by the plenary session of the House of Representatives, became law and was promulgated in March 1998 and came into force on December 1 of the same year. The tax system under the NPO Law treats nonprofit corporations as "foundations without juridical personality," which means that corporate tax is levied only in the case of for-profit business activities. Provisions regarding tax deductions for charitable donations were not incorporated when the NPO Law was enacted. The Law Partially Revising the Act on Special Measures Concerning Taxation of March 2001 was passed by the Diet and came into force on October 1, 2001, permitting tax deductions for charitable donations in the case where the donation is made to a nonprofit corporation certified to have satisfied specified conditions.

The Law Partially Revising the Law Concerning the Promotion of Specific Nonprofit Organization Activities that came into force on April 1, 2012 introduced the following changes: (1) It established a new authorization system. Along with revising authorization criteria, it moved jurisdiction for authorization work from the Commissioner of the National Tax Agency to the competent authority (mainly prefecture government). (2) It established a preauthorization system. (3) It established a required supervisory regulation.

The reform of public interest corporation system eliminated about 25,000 incorporated foundations and incorporated associations by converting them to one of four types of newly created legal persons – general incorporated association, general incorporated foundation, public interest incorporated association, or public interest incorporated foundation – or if not, by abolishing them. Incorporated foundations and incorporated associations under the old system were corporations permitted by the competent authority under the provisions of Article 34 of the old Civil Code enacted in 1896 and enforced in 1898 ("Civil Code" corporations).

According to the Basic Policy for the Fundamental Reform of the Public Interest Corporation

System decided by the Cabinet on June 27, 2003, the following is the aim of the reform of the public interest corporation system (https://www.gyoukaku.go.jp/jimukyoku/koueki-bappon/kihon_housin/index.html):

> As the values of individuals and social needs have broadly diversified in Japan, it is vital to take aggressive steps to position the private nonprofit sector that can provide diverse services to meet social needs that cannot be satisfied by the public sector and the private for-profit sector in the social economic system. The present system governing public interest corporations that has not been radically revised for more than 100 years since the enactment of the Civil Code (associations and foundations under Article 34 of the Civil Code) has played a major historical role, but it has been criticized regarding various points: the inconvenience of establishing corporations under the principle of permission by a competent authority, lack of clarity of criteria for judging the public benefit, and survival of corporations that resemble for-profit corporations. Therefore, radically revising the present public interest corporation system in order to appropriately resolve such problems and encouraging the sound development of activities of the private nonprofit sector are vital challenges.

The reform has four major characteristics. (1) Abolition of the competent authority system, (2) establishing the general corporation system that permits establishment simply by registration regardless of whether public benefits are or not provided (rule-based principle), (3) definition of "business for public interest purposes" (22 items + others) and legislation of authorization criteria, etc., so that they are more easily understood, and (4) approval of tax incentives such as exempting profits of business certified to be business for public interest purposes from taxation, and preferential measures for donations to public interest corporations. Preferential measures for taxes on contributions under the new public interest corporation system are its major achievement. It can be stated that such a generous preferential tax system does not exist in any other country (Amemiya 2015, pp 18–21, 28).

The three new acts to reform the public interest corporation system were enacted in May 2006 and came into force on December 1, 2008, followed by a five-year transition period that ended with full enforcement on December 1, 2013. The new system features at two-step incorporation structure. The first step is obtaining corporate status and the second step is becoming a public interest corporation with recognition of the public benefits of the corporation. Among cases under the jurisdiction of both the national government and the jurisdiction of prefectures, far more transitioned to general corporation than to public interest corporation. Various reasons for desiring to transition to general corporation included business for public interest purposes being less than 50% of a corporation's business, its desire to be under fewer restrictions, or its administrative system being too weak to prepare the necessary documentation. Some corporations wished to transition to a public interest corporation after transitioning to a general corporation and completing its new system under this status (Amemiya 2015, p 23).

Regarding this, nonprofit corporations obtain corporate status premised on providing specified degree of public benefits, so their system is a similar system in that it too is designed as a two-step system: first corporate status is relatively easily obtained under the rule-based principle, followed by becoming a certified specific nonprofit organization with its public benefits certified by a tax authority (prefecture government under the revised law enforced in 2012).

## Argument over the Split System

After the legislation of the NPO Law in 1998 and the reform of the public interest corporation system in 2006, the Japanese nonprofit sector now has two coexisting legal person systems for general purpose, both of which have several similar requirements for gaining these statuses. There are also other categories of special purpose legal persons, such as social welfare corporation, educational corporation (for private schools), medical corporation, and legal person for offenders rehabilitation, all of which are regulated by individual laws. In addition, there are self-help cooperatives, such as labor unions, consumer cooperatives, agriculture cooperatives, and fishery cooperatives, organized by 20-something laws. In sum, Japan's nonprofit sector organizations are

split between more than a hundred different laws, according to their unique historical backgrounds or bureaucratic sectionalism (Okamoto 2015, pp 8–9).

In order to challenge this situation, some jurists and the people working for public interest corporations in particular had an argument over the necessity of the unified nonprofit corporation system. They claimed that the unified system would contribute to the presence of the sector as a whole and enhance the transparency and make the whole system understandable. On the other hand, for the people working for the Nonprofit Corporations and intermediary and advocacy organizations who had an experience of political process of the enactment of the NPO law in 1998 in particular preferred the coexistence of two legal systems, since it would offer a choice and would guarantee the plurality of the sector (Ohta 2015a, b). The relatively substitutable between the two systems are specific nonprofit corporations and new general incorporated association, both can be established under the rule-based principle. Or, certified specific nonprofit corporations, which are certified according to its structure and contents of the income, and authorized public interest incorporated associations, which are authorized according to its structure and contents of the expenditure in budget (Yamaoka 2015, p 142). Though the latter pair share the similar preferential tax system, their legal systems as a whole are substantially different.

How can we understand the coexistence of the two legal systems for the nonprofit sector? Yamaoka (2015) distinguishes two sources of public benefits: "public benefits by citizens" and "public benefits by the private sector." Of these, activities of "public benefits by the private sector" are relatively widespread, and these activities were conducted by former public interest corporations and other "Civil Code" corporations. Activities of "public benefits by citizens," on the other hand, are represented mainly by nonprofit corporations and should be distinguished in its nature from the former. (Of course, there were many other forms of organizations, including former public interest corporations and other "Civil Code" corporations, which were devoted to the activities of "public benefits by citizens.")

Whether someone sees this difference small or crucial will depend on his or her position. In order to encourage the discussion between two camps, a survey was carried out in 2014 with the partnership of intermediary organizations of public interest corporations and nonprofit corporations. The survey investigates into the choice of corporation types by the two groups of new general incorporated associations and foundations, and specified nonprofit corporations, who gained either status in the years between 2008 and 2013 (Committee for the Survey 2015). According to the survey report, there is a significant difference in the reason for the choice between two groups. It also finds a difference between what is recognized as merits and advantages by the two groups. For who choose general incorporated associations and foundations, there are advantages in convenience and quickness of startup, and freedom from the regulations of the fields they work, management, and competent authorities. For whom choose specified nonprofit corporations, there are advantages in the reputation of high degree of citizenship, participation, and trust from the public sector.

It is also said in the report that such differences are resulted from the institutional design and the historical background, as well as from the way each group has been treated by their stakeholders. According to the survey, the relationship to the public sector in particular seems to have an impact. There are lots of subsidies, commissions, and designated managers of specific public facilities in municipalities, which are applicable only to specific nonprofit corporations and ruled out for general incorporated associations and foundations. The report points out that differentiated approaches by public sector themselves could come from different institutional designs and historical backgrounds of two types of corporations, and two will be closer if attitude of the public sector is changed (Committee for the Survey 2015, p 80).

In order to contribute to such a new argument, this paper concludes with a discussion of the

characteristics of the concept of public benefit in Japan from the perspective of the study of public administration. In Japan, activities of "public benefits by the private sector," such as corporate philanthropic activities through "Civil Code" corporations, had been widely recognized, rather than activities of "public benefits by citizens" throughout the late twentieth century. Meanwhile, "Civil Code" corporations also included either so-called quasi-public organizations or organizations in an administrative gray zone – types active under strict criteria for permission and supervision of administrative bodies – so "public benefits by the private sector" activities have also been recognized as the gray zone of administrative activities. Organizations in the administrative gray zone here include various organizations from quasi-public institutions such as nondepartmental public bodies (NDPB) or agencies, to more private ones like quasi-autonomous nongovernmental organizations (Quangos). The former public interest or "Civil Code" organizations, which functioned as the complement of public administration, belong to this category.

Such organizations in the administrative gray zone played an important role for the Japanese public administration. With regard to the proportion of the number of public servants in central and local governments against the population and the proportion of the national budget against the GDP, Japanese government is relatively "small," compared to many other advanced democracies. However, a plenty of organizations in the gray zone, which are strictly not in the public sector, have a close relationship with public sector organizations, supply the place of them, and complement their work at their beck and call. These organizations should not be underestimated when we understand the actual size and functions of the Japanese public administration (Mabuchi 2008, chapter 6).

The former public interest corporations in the gray zone contributed to the postwar rapid economic growth where resources in the private sector were mobilized to the maximum for the national goal. More recently, they were expected to play a quasi-public role to compensate the reduced number of public servant and public services in the era of retrenchment. In addition, it should be noted that these organizations in the gray zone have been comfortable place for the retired officials who look for the second appointment with reasonable pay. Because of this background, ironically, former public interest corporations were, contrary to their denomination, associated with wicked images of vested interests and appropriation of public services. Under the new public interest corporation system, which reflects the aim of the reform, what should be promoted above all is due administration of the system to encourage the activities of "public benefit by the private sector" in a real sense.

"Public benefits by citizens" on the other hand, are about searching for what are the public benefits of civil society from the viewpoint of citizens who are completely independent of the government or administrative bodies, and are displayed as influence in the forms of the capacity to propose and to advocate public policies. This influence is created because these nonprofit organizations provide their own services and learn lessons. (However, it is a mistake to simply view "public benefits by citizens" as identical to mere service provider.) As pointed out by Pekkanen (2006), although Japan's nonprofit sector is quantitatively not necessary small, because such advocacy capacity is weak, "public benefits by citizens" has been considered weaker than "public benefits by the private sector." As the establishment of the NPO Law and the new public interest corporation system have completed and diversified the legal system surrounding the nonprofit sector, the question as to whether or not to unify these systems in the future should probably be discussed by finding a way to contribute to the expansion of "public benefits by citizens."

# Legislative Oversight of Bureaucracy

Usman W. Chohan
UNSW Canberra, Business School, University of New South Wales, Canberra, ACT, Australia

## Synonyms

Bureaucratic accountability; Congressional oversight; Cycle of oversight; Legislative engagement; Parliamentary oversight

## Definition

*Legislative Oversight of Bureaucracies* refers to the set of activities that legislatures perform in order to evaluate the performance of bureaucratic institutions and the implementation of policies by bureaucrats.

## Introduction

Legislatures represent a vital pillar in democratic dispensations, and there are three primary functions attributed to legislative bodies (see Stapenhurst et al. 2008). First, they are responsible for *representation*, to articulate the divergent, and sometimes conflicting, voices of constituents and to defend the core interests of their electoral constituencies. Second, they are responsible for *lawmaking*, creating, debating, and passing

legislation that serves the interests of their constituents. Third, legislatures are responsible for *oversight*, which is to say "act as a watchdog" for the bureaucracy and for other arms of government, to ensure that the implementation of policies, as well as the institutions themselves, conform with their stipulated objectives.

Out of these three functions: representation, lawmaking, and oversight, the first two are generally well studied by scholars, constitutionally secured or mandated, and well understood by other agents of institutional power. However, the role of oversight has received less attention, is less understood, harder to evaluate, more open to negotiation, and if performed, is often done in a less consistent way than the other two roles. For example, even if legislators perform their representation role poorly, at least this role is tested in elections, and has a performance standard in terms of whether constituents feel that they are getting what they want. Similarly, lawmaking is a role that is constitutionally mandated in nearly every system, including those that may not necessarily be designated as "democratic." By contrast, the oversight role of legislatures is not addressed with the same level of urgency, and may not receive the same level of cooperation or acceptance from other institutional actors. Worse yet, oversight is generally conducted in a manner that lacks public visibility and is dispersed across different areas and over different lengths of time.

The less addressed nature of the oversight role notwithstanding, legislatures can improve the level of social governance by conducting their oversight duties in an effective way, because this role enhances the degree of accountability, transparency, and participation, all of which are crucial to the vitality of democracy. This is because legislative oversight of the institutions including the bureaucracy ensures that these agents remain responsive to the democratic will and are made answerable (held accountable) for their actions (see Chohan 2016).

The essential justification for *legislative* oversight of the bureaucracy is that bureaucrats are unelected, and are thus not directly responsible or answerable to the people. As unelected experts, bureaucrats can drift policies away from the original intent under which the policies were created. This creates a *principal-agent problem* that requires oversight to make the bureaucrats regularly accountable for the implementation of policy. By contrast, legislators are democratically elected individuals who are expected to advocate, and remained attuned to, the aspirations of their voters. Their democratic mandate justifies their watchdog relationship vis-à-vis the bureaucracy. This is why an increasing number of legislative scholars now believe that oversight is or should be the main activity of legislatures (see Stapenhurst et al. 2008).

In this sense, the problem of legislative oversight is subsumed within the longstanding quandaries pondered by thinkers of government, for as one of the American founding fathers James Madison noted:

> In framing a government which is to be administered by men over men, the great difficulty lies in this: you must first enable the government to control the governed; and in the next place oblige it to control itself.

Oversight can be thought of as the set of activities that a legislature undertakes in order to watch over bureaucratic institutions and on the policies implemented by these institutions so as to conform with their stipulated objectives, while being mindful of the impact of bureaucratic judgments and actions on the electorate that voted the legislators into power. From the perspective of accountability theory, the legislative oversight of the bureaucracy is a form of *horizontal accountability*, which means that it is part of the system of mechanisms for state institutions to check abuses or transgressions by one another (see Stapenhurst et al. 2008). This horizontal accountability should help in limiting the untoward exercise of power both by personnel and institutions of government.

Given this logic for a legislative oversight role, how can legislatures actually go about conducting their oversight work?

## The Tools for Oversight

There is in fact an array of tools that a legislature can and should use in order to perform oversight functions. They are enumerated in Table 1, and are

**Legislative Oversight of Bureaucracy, Table 1** Oversight tools for legislatures

| Oversight tool | Timing of activity | Process/body | External/internal |
|---|---|---|---|
| Questions | Ex ante & Ex post | Process | Internal |
| Question time | Ex ante & Ex post | Process | Internal |
| Hearings in plenary sittings | Ex post | Process | Internal |
| Interpellations | Ex post | Process | Internal |
| Committees (in general) | Ex ante & Ex post | Body | Internal |
| Parliamentary accounts committees (specific) | Ex post | Body | Internal |
| Commissions of inquiry | Ex ante & Ex post | Body | Internal |
| Ombudsman | Ex post | Body | External |
| Auditor-general | Ex post | Body | External |
| Legislative Budget Office | Ex ante & Ex post | Body | External[a] |

[a]Legislative Budget Offices are usually "external" in that they usually exercise independence from parliament through the status of "independent officer," but in some cases, notably Canada, the Parliamentary Budget Office has been denied this status, and this has affected its ability to perform its budgetary oversight work

described by three properties: the timing of activity, process/body, and external/internal. The timing of activity can be described by its *ante* nature, which is to say, before a policy is formulated, legislated, or implemented; or its *ex post* nature, which is to say, overseeing existing policies, after they are instated. The distinction of process and body refers to whether the form of oversight involves a series of actions (process: interpellations, questions, etc.) or to delegating oversight to a mechanism (body: committee, legislative budget office, etc.) (see also Stapenhurst et al. 2008). Oversight is *external* if it is conducted by an institution related to parliament, but which exercises a measure of independence from it. It is *internal* if the oversight is conducted from within the legislature itself.

The array of tools available to a legislature will depend on the provisions in the constitution that ascribe specific powers to the legislature. Furthermore, within legislatures, the committees tend to be the main vehicles of conducting oversight; while outside of the legislatures, the auditor general and ombudsman tend to serve as important mechanisms. Legislative Budget Offices are a comparatively new innovation in the oversight landscape, but their numbers are growing, with more than 40 working institutions around the world today. In terms of political design, it has been found that parliamentary systems tend to have more oversight tools at their disposal than presidential systems do. However, this does not mean that *actual* oversight is more effective in parliamentary systems than in presidential ones.

Given all of these possibilities for conducting oversight, it is pertinent to ask whether these tools are indeed put to use, to what extent, and whether they produce results. In practice, it appears that the presence of the tools is a necessary condition for effective oversight, but having the tools alone does not assure effective oversight without the fulfillment of other important conditions.

Some of these variables include: a robust constitutional mandate for legislative oversight, the degree to which bureaucrats are ready and willing to cooperate with the legislature, sufficient access to information to make proper and informed judgments relating to oversight, amenable personalities and their influence within the legislature, the proactiveness of legislators, the historical relationship between the legislature and the bureaucracy, the salience of issues being examined, and the general political climate and mood of the country.

Oversight tools tend to be more impactful if they force a quick response from the bureaucracy. As an example, questions to be answered immediately in the assembly or in committees tend to be more powerful oversight tools. The nonpartisanship, or at least appearance of nonpartisanship, may also be an important determinant in the power of an oversight tool. As an example, Legislative Budget Offices must provide fiscal analysis in an impartial manner, without regard

to political factors, solely on the economic merits of budgetary items. This helps them to act as an important oversight mechanism in the budget process (see Chohan 2016). Similarly, the ombudsman is an independent and impartial office, which makes it an important avenue of recourse in oversight.

## Difficulties in Oversight

Despite the aforementioned merits of oversight, as well as the requirements and the tools of oversight, in many countries there is still a critical deficit of transparency and accountability, and legislative oversight is but one part of that preponderant concern. In practice, the legislatures of many countries find it difficult to actually perform effective oversight, whether over the bureaucracy, over the budget, or over other branches of government (see also Fashagba 2009). These difficulties stem both from within and without, and can greatly hamper any significant oversight initiative.

The first difficulty arises when the bureaucracy is unwilling to provide the necessary information to the legislature. This may be due to the recalcitrance of bureaucratic culture, but may also depend on whether bureaucrats, often wielding far more specific and ample expertise on the issue, deem that legislators should not be delivered the information because it is secret, sensitive, or even just too complex. Furthermore, in some countries the lack of access to information may simply result from poor record-keeping and other such operational deficiencies. If legislators do not have recourse to a means of sanction against recalcitrant bureaucrats, then they may be helpless or at best severely limited in their oversight duties (see also Fashagba 2009).

A second difficulty arises from the lack of "attention" from legislators due to the sheer volume of matters that may require oversight. Oversight is a function of prioritization, which is why legislators must divide their attention prudently between relevant issues. If legislators attempt to oversee every aspect of bureaucratic function, they are unlikely to perform their oversight role effectively due to a lack of focus. A third difficulty stems from lack of resources such as funding or expertise. Oversight requires well-endowed legislatures that can muster sufficient resources to conduct that role. This is evident in many young legislatures, where the resource endowment is limited by insufficient competencies in research and fact-finding (see Chohan 2016).

A fourth difficulty arises from the internal politics and bickering of the legislatures, which can equally erode oversight delivery capability. Partisan agendas within the legislature can fragment the institution and prevent oversight of specific issues against which a faction within parliament holds reservations. A fifth difficulty arises from the lack of consistency among legislators. In some countries, legislatures suffer from a significant turnover of members, which means that they do not stay around long enough to complete oversight projects, and also that many inexperienced MPs enter in each period, who may in turn find it difficult to develop oversight-related acumen (see Chohan 2016). A sixth difficulty stems from corrupt practices, whereby legislators may collude with public servants to share an agency's or ministry's funds or other resources (see Fashagba 2009).

## Conclusion

Oversight is best contextualized as a cycle, wherein both ex ante and ex post processes remain continually at work (see Stapenhurst et al. 2008). Treating legislative oversight of the bureaucracy as an intermittent or periodic process can only weaken its effectiveness. At its best, which is to say, in situations where the legislature's oversight is considered a significant factor, bureaucratic agencies may be tacitly induced to shape and effectuate policy before being brought to account, and may design and act on policy with regard to anticipated legislative reactions. Yet, as the aforementioned discussion has shown, such outcomes are often stymied by a variety of limitations emanating both from within the legislature and without.

Nevertheless, an open question still persists about the causality of oversight mechanisms. It is observed that more democratically robust countries

tend to have better oversight. But is it that they had better oversight tools that they became more democratic? Or is it because they were more democratic that they put in more oversight tools? Furthermore, there are several important international organizations, such as the World Bank, that are drawing renewed focus to the creation of legislative oversight mechanisms, as a means of ensuring more participatory and accountable development. However, the actual premise of their practitioner efforts is still not a sufficiently addressed question: is legislative oversight really good for democracy? From the research undertaken by these organizations, the evidence for legislative oversight is at best suggestive (see Stapenhurst et al. 2008). Nonetheless, given the increasing interest expressed around the world for stronger oversight mechanisms that assure the vitality of democracy, legislative oversight is likely to constitute an area of further academic and practitioner interest in the years to come.

# Legislative Power

Marjorie Sarbaugh-Thompson
Wayne State University, Detroit, MI, USA

## Synonyms

Legislative politics; The power game

## Definition

Legislative power is the capacity of a legislative chamber or actors within that chamber to thwart, encourage, or compel actions by others.

## Introduction

Power is a difficult concept to define and possibly even harder to measure. This dilemma has been extensively documented (March 1966). But power is essential to the work of a legislature. So the difficult task of defining and measuring does not absolve us from the need to discuss legislative power. In this discussion, we explore first the nature of legislative power within the chamber, including its distribution among legislators and the resources that give rise to individual legislators' power. Then we address the external uses of legislative power, first to check the executive branch and then more broadly in a network of actors including legislators, other government actors, interest groups, and voters.

## The Nature of Legislative Power

Power in general comes in two overarching forms: the power to block or thwart action and the power to encourage or compel compliance (Bachrach and Baratz 1962). With respect to legislative power, the power to thwart is typified in legislative gridlock; the power to persuade undergirds legislative compromise and negotiation. The two forms of power often comingle in practice, but the distinction between the power to prevent and the power to persuade is useful in discussing legislative power. In the following discussion, we also consider the distribution and use of both these forms of power among actors within and outside a legislative chamber. Moreover, we explore the difference between formal and informal resources of power on legislators' efforts to persuade or to sabotage other actors' efforts.

## Power Within a Legislative Chamber

Some legislators are more and less powerful compared to their colleagues. Often these additional increments of power accompany formal positions, such as caucus leadership positions and committee chairs. But in many legislatures, there are also powerful legislators who do not hold formal positions of authority. In some legislatures, the concentration of power in the hands of a few chamber leaders is extreme, with the speaker or majority leader exerting a lot of power over her or his colleagues. In these legislatures it is rare for legislators other than caucus leaders or committee chairs to wield power. Other legislatures are more egalitarian, with power distributed more broadly throughout the entire membership.

These differences are especially apparent in state legislatures. Some of these are replicas of the US Congress – the so-called professional state legislatures – in which leaders, such as the speaker, have access to staff resources and sizeable campaign coffers. These leaders also have the power to set the chambers' agenda by controlling what business reaches the floor for votes and which committees are tasked with crafting specific pieces of legislation. Thus legislative power can be concentrated in the hands of a few actors. In other legislatures, sometimes referred to as part-time or citizen legislature, power can be more widely distributed among many legislators.

## Comparing Concentrated Versus Distributed Power

Although it might seem logical that concentrated power would produce better outcomes, there is some evidence that in democratic institutions, widely distributed power leads to more programmatic success (see the work of Tannenbaum 1961, 1968, 1986). Tannenbaum argues that this is the result of a greater volume of power in an organization in which power is distributed more broadly among the membership.

This raises questions about whether power is a finite commodity that is allocated among members of a group or whether it is possible for the volume of power in a group to expand as more participants are empowered or to contract as it is concentrated in the hands of a smaller cabal. At the heart of this debate is whether power is zero-sum or not. That is, if one person gains some amount of power, does someone else lose an equal amount of power?

The tendency in a democracy is to conclude that the more people who are empowered, the more effective the system. One can easily envision advantages of wider participation in generating options, crafting compromises, and coopting legislators into supporting a deal. This definition of the effectiveness of power seems to focus heavily on the power to persuade rather than the power to thwart, however.

On the other hand, one can readily conceive of instances in which concentrated power would be quite effective in blocking negotiated compromises, depending on the prerogatives to thwart action wielded by a key legislator – for example, a speaker or majority leader. So power concentrated in the hands of the speaker or a committee chair means that other legislators lack the means to rebuff the speaker's blockage. Therefore, when one thinks about the effective use of power, the form of power seems to interact with the concentration or distribution of power.

## Formal Power Versus Informal Power

The distinction between formal and informal power is germane to the distribution of power in a legislature and is associated with the two forms of power as well. Formal power arises from the official positions that legislators hold and the prerogatives associated with those positions. For example, chamber leaders, such as the speaker or majority leader, are authorized to select committee chairs or to control the calendar for floor votes and other chamber business. Formal power, therefore, is more likely to be concentrated in the hands of a small group of legislators, typically caucus leaders such as the speaker or majority leader. And, when one person among these leaders possesses a prerogative, other legislators typically lack that source of power. Therefore, formal

power does seem to be a zero-sum commodity. If the constitution or the chamber rules change and shift a particular prerogative from one legislative position to another, then one legislator loses power and another gains an equal amount of power. This power inheres in the position not the person. Moreover, as speakers come and go, the legislator holding the speakership gains and loses power.

Informal power on the other hand is derived from personal qualities, such as a legislator's reputation as an honest broker in negotiations, or from her or his knowledge, expertise, or experience. In other words, informal power is personal – accruing to an individual. The number of legislators who have knowledge about or expertise on an issue is not finite. It can expand or contract without shifting power from one legislator to another. Informal power is clearly non-zero-sum and lends itself to expansion and contraction across time and circumstances.

French and Raven (1959) developed a widely known taxonomy of the sources of power. These sources include: legitimate power (based on formal prerogatives), referent power (based on personal qualities), expert power (based on knowledge and expertise), coercion (based on credible threats), and rewards (based on the ability to distribute something of value). Referent power and expert power fall into the category of informal power. Legitimate power is clearly formal power, while the ability to coerce and reward are likely to be enhanced by the prerogatives of a legislator holding a formal position. But one can also envision coercion and rewards that might involve informal power in tandem with formal power.

Obviously formal power and informal power are not mutually exclusive. A legislator holding a formal position with attendant sources or power can use that power more or less effectively based on his or her personal qualities and reputation – informal power. Moreover, power is relational. Legislators with power have to be willing to use their power, but their actions do not occur in a vacuum – their colleagues can comply or resist based on their own, often informal, power resources.

## The Use of Legislative Power

Externally, legislative power is fundamental to the American system of checks and balances between branches of government. In particular, during periods of gridlock, legislatures are seen as thwarting or checking the power of the executive branch. This power is exercised through refusal to pass budgets and laws, refusal to confirm appointees, failure to ratify treaties, or by publicly challenging and embarrassing executive branch appointees and civil servants during oversight hearings. The use of legislative power to thwart the executive branch does not occur in a vacuum and depends on the power resources the executive branch brings to the table. For example, is the governor or the president able to reward or coerce the legislature into a more supportive or at least less oppositional posture? The power of a legislature varies in tandem with the formal and informal powers of its executive branch partners – typically the US president or state governors. Thus, power is relational – contingent on power and intentions of multiple sets of actors. The formal powers of these executive branch partners typically is codified in constitutions, but their informal powers rise and fall with their public popularity and their expertise and experience.

Among US state governments, the formal powers granted to legislatures and governors vary widely as demonstrated by an ongoing multi-year project by Martorano et al. (2016) analyzing state constitutions. In some states, legislative sessions are limited. State legislators are restricted to meeting for a set number of days per year or sometimes even just a few days every other year (see Montana and North Dakota). In these states, the power of the legislature vis-à-vis the governor is quite limited, and the executive branch is the dominant actor. In other states, with more professional legislatures, the national system of checks and balances between coequal branches of government is replicated at the state level. These legislatures, which often meet year-round, have more power to thwart or to motivate the behavior of their executive branch counterparts. For their part, the head of the executive branch, whether a governor or the president can parry legislative

power using various forms of the veto. On the other hand, legislatures can refuse to fund executive branch activities, and presidents and governors cannot pass laws.

More importantly for readers in the field of public administration, legislatures, both state and national, typically have the power to monitor or oversee the work of the bureaucracy. There are two broad categories of oversight: fire alarm and police patrol. The former is a response to a crisis or at least an unanticipated problem. The latter, police patrol oversight, involves continuous and systematic trawling for agency performance measures. It is unclear how effectively legislatures perform this task of overseeing the work of the bureaucracy. And oversight hearings often peak during periods of divided government implying that the motivation is political gain rather than service delivery improvement. Moreover, there is some evidence that state legislators fail to use this power because they do not realize that they can. Sarbaugh-Thompson et al. (2010) in interviews with legislators in a highly professional chamber discovered that a sizeable proportion of these legislators believe that the governor is solely responsible for monitoring the work of the state agencies. These authors attribute some of this to the lack of experience introduced under state legislative term limits, but more broadly it underscores the fact that an effective use of power requires skill and will.

It appears that legislators who perform oversight of the bureaucracy effectively are veterans who combine both formal and informal power. Legislators who are described by their colleagues as exemplars of state agency monitoring accomplish this in two ways. First, they are highly experienced with a vast reservoir of knowledge about the work of the agency. Second, they are likely to have personal relationships with agency bureaucrats based on trust and honesty. For example, there are stories of legislators who help interns from their office apply for civil service jobs. These interns then feel confident that they can confide in the legislator or legislative staff that they know personally if they want to provide information about a problem within the agency. This facilitates confidential leaks of key information that can be useful in committee hearings scrutinizing the work of the agency. Similarly, these bureaucrats with ties to a legislator's office are an easily accessible source of information when the legislator has a question about how things are going within an agency. So once again, we find that legitimate power (committee chair's prerogatives to call state agency staff as witnesses in committee hearings) in tandem with informal power accruing from skill and trustworthiness (expertise and referent power) enhances the use of power.

## Power as a Relational Phenomenon

This brings us to another important characteristic of legislative power – it is part of a multiplayer game. The classic iron triangle depiction of legislative power as a vertex in a triangle formed with interest groups and state agencies moves our vision of legislative power beyond the confines of the chamber or the branches of government. Legislative power is fundamentally relational. It is based at least in part on a grant of power from the larger public – both voters and ordinary citizens at the ballot box. Legislative power can, also, serve as a tool used by the extraordinarily advantaged groups and individuals who attempt to use their money and their own positions of power in the economy and global affairs to persuade legislators to do their bidding.

Voters' and ordinary citizens' efforts to channel the legislators' power toward fulfilling their wishes is limited for a host of reasons. Chief among these is the fact that with the advent of sophisticated demographic models and creatively drawn district boundaries, it is increasingly likely that legislators have more say in selecting their preferred voters than voters do in electing their preferred legislator. Moreover, there is rarely a cohesive public mandate that legislators could respond to even if they wished to do so. That is, public opinion is notoriously unstable and fragmented on specific issues. Economic and interest group elites can be just as diverse and fragmented as the general public, but there are instances in which they formulate a more cohesive agenda and coerce or reward legislators using

their resources of power, such as campaign donations, media attention, or their seal of approval to their group's members.

As the cast of players expands, the legislative power game looks more like issue networks rather than iron triangles (Heclo 1978). Legislators are enmeshed in a complex web of power-wielding actors pursuing multiple goals, and these other actors mediate legislative power. For example, the power of the big financial institutions to bring down the economy during the 2008 financial crisis induced reluctant legislators to use their power of the purse to prop up the banks while individual homeowners suffered.

Rather than individual players there are teams of players, and legislators are part of one or often several teams. In the 2008 financial crisis, there were financial sector interest groups, both the executive branch and legislative branches of government, both political parties' presidential candidates, and throngs of fearful citizens and other business interests, as well as international global actors. So the legislative power game is not a two-player game. The legislative power game might more aptly be imagined as the Tour de France rather than a football or baseball game. Individual teammates' importance ebbs and flows depending on the context and issues. And multiple teams vie for leadership, jockeying for top positions.

## Political Parties as Conduits of Legislative Power

A discussion of legislative power would be profoundly incomplete without discussing the mediating role of political parties. Within a legislature, political parties, at their best, are teams seeking success for a common agenda. At their worst, political parties in the legislature are gangs in which loyalty to the ingroup and opposition to the outgroup are essential for survival. Yet loyalty to the dictates of his or her political party can lead a legislator to risk electoral defeat. So the political party, just as a team or gang might, insures that the loyal member can benefit even in defeat. This reward for loyalty can be fulfilled by placing a defeated legislator in an appointed position in government or under the umbrella of allied groups external to government (e.g., lobbying or think tank positions).

Discussing political parties brings us full circle in our discussion – back to the individual distribution of power within a legislative chamber. Chamber leaders are also party leaders. They can combine the prerogatives of their formal position in the chamber with informal power resources to enforce party discipline. Campaign funds provided by chamber political action committees (PACs) are not unique to national politics. They are powerful resources for state legislative leaders that can be used to reward loyal behavior. Prized committee assignments reward loyal partisans within the chambers. On the other hand, individual legislators often donate large sums to the chamber caucus PAC, which the leader uses to reward compliant colleagues. But this money often comes with expectations of a plum committee assignment or some other reward. So the speaker's power is checked by the power of other legislators. Moreover, legislative leaders are chosen by popular vote of their co-partisans, so although their formal powers might permit harsh tactics to hold their caucus in line, their willingness to threaten their colleagues is constrained by a parallel threat that their colleagues might oust them from their leadership position. Once again, power is relational and must be viewed within the larger system and the current circumstances.

## Measurement of Power

Finally, we turn to the question of how to assess and measure power. How do we determine who is more powerful in a particular legislature? And even more challenging, how do we compare the power of different legislatures? A lot of attention focuses on measuring the power of legislative leaders whom most observers widely agree are typically the most powerful actors within a legislature.

There are two overarching approaches to measuring legislative leaders' power: reputational measures based on the judgment of knowledgeable informants or a composite of various formal

prerogatives assigned to leaders by constitutions and chamber rules. One of the more interesting finding of the research on the power of legislative leaders is that these two approaches to measuring leadership power are poorly correlated (Battista 2011). This reminds us that power involves both formal and informal facets. Reputational measures of power are likely to incorporate informal power, while the list of formal prerogatives is restricted to only one facet of power – formal power. It is then less surprising that these measures are not highly correlated. Once again we point out that power includes informal and formal components. But, moreover, it is relational and needs to be measured vis-à-vis the power of other network actors (e.g., executive branch partners and interest group networks).

One underutilized approach to analyzing legislative power involves network analysis – a set of analytic tools based on matrix algebra that focuses on the ties between actors. This set of techniques lends itself to reputation analysis of the power of legislative leaders because all legislators in a chamber can be asked who they consider to be powerful. This information is then entered into matrices in which the respondents form the rows of a matrix and in which all chamber members form the columns. A value in a cell in a matrix represents that a particular respondent (the row) named a particular colleague (the column) as powerful. There are numerous ways to analyze the resulting matrix to determine the concentration of power and linkages between powerful legislators within the chamber (Hanneman and Riddle 2005). Not only is this set of techniques well suited to data based on reputational measures of power, network analysis underscores the relational nature of power.

## Conclusion

Legislative power inheres in positions (formal power) and arises from individual qualities and behaviors (informal power). Sometimes legislative power is widely distributed and other times it is concentrated narrowly in the hands of a few key legislators, typically chamber leaders. It requires both skill and will to use legislative power effectively. Its use includes the power both to thwart actions of others and to encourage or motivate action by others. But legislative power does not exist in a vacuum. It exists in a network of actors, all of whom have their own bases of power and their own levels of skill and willingness to use power to thwart or to enhance the plans of legislators. This produces a multiplayer legislative power game in which political parties, both within and outside the legislature, are key players.

# Legislative Study on Government Regulation

Lucas Lockhart
Department of Political Science, University of Minnesota, Minneapolis, MN, USA

## Synonyms

Legislative delegation of regulatory power

## Introduction: Politics Not Complexity

The legislative study of government regulation is largely dominated by the following question: why and under what conditions do legislators delegate regulatory power to independent commissions and/or executive bureaucracies? One of the most obvious and frequently cited drivers of delegation is the increasingly complex and dynamic nature of modern society. Given that the time and resources of lawmakers are scarce, they may find it difficult to craft coherent policy responses to the social risks and market failures created by unceasing socioeconomic change. As a result, delegation to specialized nonlegislative actors with high levels of policy expertise can be a net positive for legislators, particularly when policies are technically complex and their effects uncertain (Bawn 1995). Legislators can indirectly provide policies that both interest groups and citizens demand without becoming consumed with the politically unrewarding tasks of oversight, monitoring, and detailed policy implementation. Citizens and interest groups get "better" regulatory policy because it is made by specialized actors with higher levels of technical expertise and better knowledge of ever shifting social and economic conditions.

While this "gains from specialization" account is intuitive on its face, it is politically naïve and ignores instances in which legislative bodies bypass opportunities for delegation and directly address complex regulatory issues themselves (Fiorina 1982). Four decades of social scientific research repeatedly comes to the same conclusion: politics are paramount in legislators' regulatory decision making. Not only do political conditions shape legislators' decisions to retain or delegate regulatory power, they fundamentally affect the amount of discretion that lawmakers grant to their regulatory agents (Moe 1984; McCubbins 1985; Huber and Shipan 2002). Government regulation cannot be understood without direct reference to political struggles between legislators, executives, bureaucrats, political parties, and interest groups.

## The Decision to Retain or Delegate Regulatory Power

The initial decision over whether to retain regulatory authority or to delegate it to some non-legislative administrative entity is driven by several factors. These include (1) levels of legislative and bureaucratic capacity, (2) whether a particular regulatory area creates opportunities to claim credit or avoid blame for the benefits and costs of policies, (3) policy uncertainty, (4) the desire to lock in preferred policies to increase policy stability and coherence, and (5) levels of policy agreement among legislators, executives, and bureaucrats.

For a legislature to retain regulatory power, they must have the capacity to do so. In other words, they must possess the necessary organization, financial resources, knowledge, and experience among members and staff to effectively formulate regulatory rules and monitor adherence to those rules by social actors (Huber and Shipan 2002). If a particular legislature lacks a robust and specialized committee system or if legislators and their staff simply lack the necessary policy expertise, the delegation of regulatory power will become increasingly appealing. Obviously, this is a relative judgment. Legislators' willingness to delegate will also be dependent upon the technical capacity of bureaucratic actors to regulate in ways that reflect legislators' preferences (Huber and McCarty 2004).

Even if a particular legislature has the capacity to retain regulatory authority, it may lack the political incentives to do so. Government

regulation creates benefits and costs for different groups within society. While legislators are undoubtedly concerned with securing their ideal regulatory policies, their policy pursuits are almost always shaped by their desire to claim credit for policy benefits and to avoid blame for their costs (Fiorina 1982). As a result, where benefits are large and visible to their constituents and/or politically powerful interest groups, legislators should be loath to delegate regulatory authority. Where costs are significant and easily perceivable, delegation should be pursued aggressively. However, legislators do not always have a clear understanding of the costs and benefits of particular regulatory policies. This policy uncertainty and the doubt it creates with regard to future opportunities for credit claiming should lessen legislators' desire to retain regulatory authority.

On occasion, legislators do have a clear idea of what the optimal regulatory policy should be over the long run, but they lack the short-term political incentives to consistently pursue that policy. This time inconsistency problem can occur with regard to a variety of policies, but has been the most systematically explored with regard to the regulation of money supply and public utilities (Kydland and Prescott 1977; Rogoff 1985; Spiller and Tommasi 2005). More broadly, lawmakers often recognize the benefits of regulatory stability and consistency over time, but short-term electoral concerns may tempt them to strategically alter rulemaking or monitoring efforts in an attempt to win political contributions from powerful interests or votes from the general public. When these credibility problems become sufficiently costly for lawmakers in terms of forgone private investment, economic stagnation, or social disruption, the delegation of regulatory power to a politically insulated administrative entity becomes more attractive (Gilardi 2005).

The final and perhaps most important factor driving legislators' decision to delegate regulatory authority is the degree to which the incentives facing their potential regulatory agents are compatible with their regulatory policy preferences. Stated simply, if legislators and those to whom they delegate will regulate in precisely the same way, legislators face few costs from ceding regulatory authority. In contrast, if potential regulatory agents have significantly different preferences from those held by legislators or lack the incentives to pursue legislators' preferences, lawmakers will be more likely to retain regulatory authority or severely limit their regulatory agents' discretion (Epstein and O'Halloran 1999; Volden 2002a).

To summarize, past research suggests that legislators will be the most likely to delegate regulatory authority when (1) policies are complex and policy effects uncertain, (2) legislative capacity is low and bureaucratic capacity is high, (3) opportunities for credit claiming are few and blame avoidance is politically expedient, (4) maintaining credible commitments to long-run regulatory policy stability and consistency is difficult, and (5) potential regulatory agents share the legislators' policy preferences.

## Legislators' Choice of Regulatory Agent

Legislatures that do delegate regulatory authority cannot do so without costs. Known as "agency costs" in social scientific literature, these costs are often nonmonetary, are affected by political conditions, and include the costs of monitoring regulatory agents and the costs incurred when regulatory agents defy legislators' preferences (McCubbins 1985). Like the initial decision to delegate, the desire to minimize agency costs fundamentally shapes *how* regulatory power is delegated. Fortunately for legislators, they are often able to choose among existing regulatory agencies or create new organizations from scratch. The most basic choice is whether to delegate regulatory duties to the executive bureaucracy or an independent regulatory commission. The latter has become increasingly common across much of the world and can be found in a wide variety of economic and social sectors (Gilardi 2005; Levi-Faur 2005). Independent commissions differ from executive bureaucracies in their greater insulation from executive influence, multimember boards, staggered appointment terms, and longer-term lengths that do not coincide with executives' tenure in office, formal protection

from policy-related dismissal, and even requirements that appointments alternate in terms of partisanship (Gilardi 2002). In contrast, most executive agencies lack any semblance of political autonomy and are often run by a single agency head that executives can appoint and remove at will.

Research is clear; legislators' choice between independent commissions and executive agencies is inherently political. These findings are most obvious in political systems with a separation of executive and legislative power such as the United States. Echoing findings from Epstein and O'Halloran (1999), Volden (2002b) finds that legislatures are more likely to delegate regulatory authority to executive agencies when the executive branch is of the same political party (i.e., unified government), while delegating to independent commission is more common under divided government. Work by Wood and Bohte (2004) reinforce these conclusions. They find that conflict between the legislative and executive branch, measured in terms of presidential vetoes and veto override attempts, increases the probability of creating independent commissions with politically insulated leadership.

Another political factor that shapes regulatory organization are overall levels of political uncertainty. When legislative majorities are weak or divided, or if electoral turnover is high, legislators face greater uncertainty as to whether their regulatory policies will be preserved after the next election. Evidence suggests that this directly affects legislators' organizational preferences as they seek to insulate their regulatory policies from future majorities (Moe 1990). Once again, Wood and Bohte (2004) find that as the proportion of new members of Congress increases, as majorities get smaller in size, and party cohesion decreases, new regulatory organizations are more likely to be independent commissions and have politically insulated leadership. This finding is not limited to the American context. Scholars of the European Union have found that agency independence varies according to the feasibility of policy change within the supervising EU institution. Wonka and Rittberger (2010) find that agencies overseen by supranational forums, which are operated according to qualified majority decision rules, are more independent than agencies overseen by the EU's intergovernmental decision-making forums where cross-national unanimity is required. Stated differently, when decision-making rules ease policy change and thereby increase political uncertainty, EU lawmakers confer higher levels of political autonomy to EU regulatory agencies.

Finally, political uncertainty may also heighten legislators' concerns with regard to policy credibility. Particularly when electoral turnover is high and institutional veto points are few, alternating legislative majorities may lead to drastic alterations in rulemaking, monitoring, and enforcement priorities. This instability and incoherence may be particularly damaging in economic sectors that are recently privatized, exposed to international competition, or dependent upon long-term investments. As a result, desires for greater policy credibility may be another factor driving legislators' preference for politically insulated commissions over more politicized executive agencies. Despite the intuitive nature of this argument, it has received only mixed empirical support depending upon how credibility problems and political uncertainty are conceptualized (Elgie and McMenamin 2005; Gilardi 2002).

## Legislative Control of Regulatory Agents

In addition to the choice of regulatory organization, legislators have a variety of other ways with which to control their regulatory agents both before and after delegation has occurred. As before, choices concerning regulatory agency control and discretion are deeply influenced by politics. Perhaps the most straightforward way for legislators to control their regulatory agents is through the specificity of authorizing statutes (see ▶ "Lawmaking and Public Administration" for related issues). If lawmakers want to exercise a maximum degree of control over their regulatory agents, they carefully draft highly detailed statutes that leave little room for interpretation or bureaucratic discretion (Huber and Shipan 2002; see ▶ "Administrative Discretion" for a more focused

discussion of this issue). Obviously, crafting highly detailed statutes dealing with complex regulatory issues is not without costs, and only some legislative bodies have the capacity to draft them. That said, political disagreement and threats of political uncertainty once again reemerge as key driver of statutory detail. Utilizing Medicaid legislation from 38 American states and labor legislation from 29 parliamentary democracies, Huber and Shipan (2002) find that the specificity of statutes is positively related to policy disagreement between American governors and state legislatures, levels of cabinet turnover, federalism, and the presence of minority and coalition governments. All of these conditions either increase opportunities for conflict between legislators and their regulatory agents or heighten the risk that future legislative coalitions will have different regulatory priorities.

Crafting detailed legislation is often accompanied by other levers of influence. The most prominent among these are administrative procedures that regulatory agents must follow when exercising delegated power (see ▶ "Administrative Procedure" for more detail). The Administrative Procedure Act of 1946 is a clear example. The Act and others like it require that agencies provide information to the public regarding their internal organization and decision-making practices, publish notices of proposed and final rules, and involve the public in rulemaking through mandatory comment (and response) periods (see ▶ "Agency Rulemaking" and ▶ "Formal Rulemaking in Public Administration" for more detail). Other administrative procedures alter the judicial process by lowering barriers to litigation for particular groups or assigning the burden of proof to specific parties. Within some regulatory jurisdictions, agencies must submit proposed rules to cost-benefit or budget impact analyses. According to pioneering work of McCubbins et al. (1987), legislators create these administrative procedures to reduce bureaucrats' informational advantages, raise the costs of ignoring legislative preferences, and "stack the deck" in favor of interest groups that share legislators' regulatory preferences. Rather than have to expend scarce time and resources constantly monitoring their regulatory agents, many administrative procedures allow legislators to delegate oversight activities to private interest groups. When agencies deviate from legislative intent, interest groups trip "fire alarms" in the form of litigation, hostile comments during notice and comment periods, press campaigns, or direct lobbying (McCubbins and Schwartz 1984).

The final set of methods available to legislators is perhaps the most familiar to ordinary citizens. Legislators can hold high-profile congressional hearings or investigations to embarrass wayward agency officials, cut agency budgets, block nominations to agency leadership positions, reduce agency discretion through legislative change, or, if allowed by law, exercise a legislative veto over regulatory rules (see ▶ "Legislative Veto" for more detail). While these more high-profile actions may create clearer opportunities for credit claiming and position taking, they are also more costly in terms of time, bargaining, and coordination.

## Conclusion

Policy complexity, gains from specialization, and technical capacity obviously have a significant impact on legislators' regulatory decisions. However, political considerations are never absent from legislators' minds and may even come to dominate regulatory choice. These considerations include opportunities to claim credit and avoid blame, the political uncertainties associated with electoral politics, the difficulties involved in delivering regulatory policy stability and consistency over time, interest group mobilization, and divergent policy preferences within and between legislative, executive, and bureaucratic actors. All of these political conditions profoundly shape whether legislators retain regulatory power or delegate it to bureaucratic actors. Furthermore, they affect the political independence of regulatory organizations, the amount of discretion they are granted, and the procedures they must follow when exercising their regulatory duties.

# Legislative Veto

Gregory Neddenriep
Northeastern Illinois University, Chicago, IL, USA

## Synonyms

Congressional veto

## Definition

Legislative vetoes are negotiated arrangements between Congress and the executive branch whereby Congress gives agencies discretionary authority to establish administrative regulations that have the force of law, while Congress exercises supervisory control by retaining the authority to prohibit certain executive actions by passing either a concurrent resolution in both of its chambers or a simple resolution in one of its chambers or committees. Legislative vetoes technically occur outside the Constitution's step-by-step lawmaking process, and they reverse the bargaining roles traditionally occupied by the legislative and executive branches in their negotiations with one another.

## Introduction

Most scholars believe that legislative vetoes originated in the 1930s, but others say that they can be traced to an earlier time. Legislative vetoes have been inserted into substantive pieces of legislation dealing with the environment, the economy, arms sales, federal salaries, product safety standards, student loans, and executive branch reorganizations. This procedural device was invented because presidents and their administrators sought more discretion over public policy, but Congress would not yield this authority without retaining supervisory control. Congress found that exerting control in the constitutionally prescribed manner – by passing a public law – was unacceptable because it was cumbersome, slow, and subject to the president's veto. The legislative veto, therefore, serves as a compromise whereby executive agencies are allowed to promulgate administrative regulations and make policy decisions that have the force of law unless Congress objects. Congress can object by passing concurrent resolutions in both chambers or by passing a simple resolution in one of its chambers or committees. These efficient arrangements essentially reverse the lawmaking process set out in the United States Constitution. Rather than Congress presenting legislation to the president for approval or veto, it is the executive branch's responsibility to initiate proposals and Congress's responsibility to decide whether proposals will take effect. Furthermore, the legislative veto relaxes the Constitution's bicameral requirement that calls for both chambers of Congress to play a role in the lawmaking process. This entry considers the constitutional dimensions of the legislative veto and the implications of the United States Supreme Court's decision to declare such arrangements unconstitutional.

## The Way Federal Courts Have Approached the Legislative Veto

Although the legislative veto seems to have emerged in the 1930s, it was not until the 1970s when federal courts began seriously considering whether this practice violated the United States Constitution. The federal courts initially decided these cases on narrow or procedural grounds, seeming to appreciate that these legislative-executive arrangements were collaborative compromises designed to satisfy pressing and legitimate institutional needs. Federal courts, however, became more willing to engage the substantive issue as Congress began using legislative vetoes to broadly dictate administrative policy rather than using them to carefully target specific administrative determinations (Fisher 2007; Nowak and Rotunda 1995). This evolutionary process reached its dénouement when the United States Supreme Court considered *Immigration and Naturalization Service v. Chadha* in 1983.

In *Chadha*, the Court struck down a legislative veto embedded in the Immigration and Nationality Act that allowed either chamber of Congress to pass a resolution overruling the attorney general's decision to suspend certain deportations. Chief Justice Warren Burger wrote the Court's opinion, which was joined by six other justices on the issue of the one-chamber veto. According to Burger, this legislative veto and others like it violated separation of powers derived from the Constitution's overarching structure as well as two constitutional requirements emanating from the separation of powers: One, bicameralism located in Article I, Sections 1 and 7; two, both "presentment" clauses found in Article I, Section 7. In other words, the Court concluded that, when making law, both chambers of Congress must participate because this facilitates deliberation and debate in varied settings, encourages thorough analysis of issues, and safeguards liberty by distributing power. Furthermore, the Court concluded that any legislation that Congress passes must be subject to the possibility of a presidential veto so presidents may protect the public from imprudent laws, encourage laws to have a national perspective, and prevent Congress from usurping executive power. The Court insisted that Congress comply with bicameralism and presentment whenever its actions change the legal rights, obligations, or relationships of persons who are not part of the legislative branch. Presumably this means that Congress may manage its internal affairs as it sees fit, and it need not honor these

precepts when fulfilling its role in treaties, impeachments, and appointments. However, it must forgo the legislative veto after it assigns administrative responsibilities to executive agencies. Taken at face value, *Chadha* stands for the proposition that once a bill is enacted into law, Congress may not intervene in executive branch affairs unless it passes another public law.

The decision was formalistic. Rather than valuing efficiency and other practical considerations, the Court suggested that it would closely adhere to the Constitution's text, history, and structure when resolving these types of disputes (Korn 1994–1995). Some aides in the Reagan administration favored this approach because they believed that it would reduce congressional interference in executive branch affairs. Likewise, some administrators applauded the ruling because they believed that the legislative veto negatively affected the policy implementation process. These administrators reasoned that the Administrative Procedure Act of 1946 created a process that allowed administrative rules to be put in place only after the public had been given an opportunity to comment on the proposals so as to promote due process, transparency, and responsiveness (West and Cooper 1983). They thought that the legislative veto work against these objectives because congressional control was exercised privately, the public was not directly involved, and Congress was assumed to be more responsive to organized interests than the general public.

Although the legislative veto is a "creature" of the federal government, states have experimented with it from time-to-time. Beginning with Kansas in 1939, as many as 17 general assemblies wielded the legislative veto at one time or another (Levinson 1987). The Court's ruling in *Chadha* did not affect these legislative vetoes because their validity turns on how each state's constitution is interpreted. Nevertheless, many state courts eventually ruled that legislative vetoes violate separation of powers.

## Criticisms of the *Chadha* Decision

Justice Byron White, who dissented, and scholars such as Eskridge and Ferejohn (1992) expressed concern that *Chadha* impaired the government's ability to make policy in a way that was practical, feasible, flexible, and efficient. These functionalists suggested that courts should either adopt a more elastic interpretation of separation of powers or be more reluctant to intervene in situations where the other branches of government have streamlined the policy-making process through consensual negotiation. Rather than a decision based on the Constitution's text and structure, functionalists would have preferred *Chadha* to have turned upon the legislative veto's origin, purpose, and how it balanced power between the branches (Korn 1994–1995). Furthermore, functionalists pointed out that *Chadha* is difficult to reconcile with many time-honored congressional shortcuts such as the suspension of rules, unanimous consent agreements, and the placement of riders on appropriations bills. Similarly, they noted that *Chadha's* call for strict procedural adherence is at odds with the president's unilateral creation of law-like policies with executive orders.

Critics also challenged the way the *Chadha* Court applied the separation of powers doctrine, which, at its core, is designed to ensure that the governmental branches are coequal and dominant in their constitutionally assigned areas. First, according to Justices Rehnquist and White, the Court should not have struck down the legislative veto in the Immigration and Nationality Act while still preserving the remainder of this legislation. By doing so, the Court advantaged the president in a deal that Congress would have been reticent to accept without this concession. Second, critics reject the Court's assertion that legislative vetoes create new law each time they are invoked (Fisher 2007). Instead, they see the legislative veto as a part of the original bargain struck between Congress and the president. Hence, when courts invalidate a legislative veto like the one in *Chadha*, it is the judiciary that creates new law by altering the original agreement. Finally, Justice White observed that legislative vetoes maintain the *status quo* rather than conferring some special advantage upon Congress. In the Constitution's lawmaking process, Congress initiates proposals and the president must approve or disapprove without modifying their content. The legislative veto is similar in

that one branch initiates proposals, while the other must accept or reject them without amendment. Therefore, from White's perspective, both branches remain equal bargaining partners although their roles have reversed.

## Aftermath of *Chadha* and Fate of the Legislative Veto

Shortly after *Chadha*, some scholars predicted that the decision would induce conflict between the executive branch and Congress because it invalidated a mechanism that promoted institutional bargaining and cooperation (Cooper 1983; Franck and Bob 1985). More recently, scholars have contended that the importance of the legislative veto has been exaggerated (Korn 1996) or that Congress has been able to fulfill its intuitional role because it found other strategies and procedural devices to replace the legislative veto (Fisher 2007; Franklin 1986). According to the later perspective, relationships between the branches remained substantially the same because presidents and their administrators still demanded flexible authority, while Congress still insisted on a satisfactory means of supervisory control.

The literature gives great attention to strategies and procedures that Congress began using in place of the legislative veto (Fisher 2007; Franklin 1986; Korn 1994–1995). Congress exercised control by writing laws that placed detailed constraints on executive agencies, by granting agencies authority for shorter periods of time, and by attaching language to appropriations bills that prohibited agencies from using funds for specific activities. Congress also relied on a court sanctioned "report-and-wait" strategy where it passed statutes requiring agencies to notify an oversight committee before taking certain actions or implementing particular programs. This approach compelled agencies to seek prior approval from the oversight committee if they desired to take prompt action. Moreover, Congress passed statutes containing a joint resolution of approval procedure, which required presidents to garner the support of both chambers of Congress within a given time period or particular regulations or programs would automatically lapse. This procedure honors bicameralism and presentment, occurs within the lawmaking process, yet produces the same result as a legislative veto if one chamber withholds support. As these examples illustrate, Congress demonstrated great procedural ingenuity while attempting to comply with *Chadha*, but many of its alternative approaches inconvenienced the executive branch.

There have also been instances where the two political branches of government circumvented *Chadha*. On some occasions, Congress inserted legislative vetoes into legislation, while presidents often signed these bills into law without complaint (Fisher 1985, 1993, 2007; Glennon 1989). On other occasions, the bargainers entered into these arrangements informally by moving the "legislative vetoes" from the face of the legislation to the conference reports and by giving their agreements innocuous designations such as "legislative-executive understandings" (Fisher 1993, 2007; *see also*, Glennon 1989). Although these gentlemen's agreements are contrary to the spirit of *Chadha*, they are unlikely to violate the letter of the law because they are unenforceable and not technically part of the legislation. Yet, in application, they function like an overt legislative veto when they satisfy the institutional needs of the bargainers. Fisher (2007) explains that presidents and their administrators usually acquiesce and are disinclined to litigate because they attach considerable value to administrative flexibility. In essence, presidents and their administrators have generally concluded that it is better to tolerate the occasional congressional intrusion rather than receive no grant of authority at all or receive only small modicums of discretionary authority through a series of *Chadha*-compliant laws. In sum, administrators have come to realize that Congress is more willing to grant them authority and flexibility so long as it is convinced that it has a sufficient means of supervisory control.

Does Congress have any limit when using procedural devices like the legislative veto? In a legal sense, the answer is, "yes." In *Metropolitan Washington Airports Authority v. Citizens for the Abatement of Aircraft Noise* (1991), the Supreme Court, relying on separation of powers, struck down a federal law that created a congressional review board that could veto the actions of a

regulatory body that operated two District of Columbia airports. Hence, the Court has been willing to reassert *Chadha* even though the other branches of government find it to be out-of-step with the realities of modern government. Yet it is difficult for the federal courts to reassert *Chadha* and to insist on close adherence to the Constitution's formalities when the executive branch consensually bargains with Congress and is disinclined to litigate. Therefore, as a practical matter, members of Congress and their bargaining partners in the executive branch can enter into these arrangements in satisfaction of their institutional needs so long as no third-party stakeholder is willing and able to bring the matter before the federal courts.

## Conclusion

The legislative veto is a procedural mechanism that enables Congress to oversee executive branch agencies after it has granted them discretionary authority. It works by reversing the direction of the Constitution's lawmaking process so that executive agencies initiate proposals and Congress accepts or rejects them through various forms of resolution. The Supreme Court, in *INS v. Chadha* (1983), declared this practice to be a violation of the Constitution's separation of powers framework, as well as bicameralism and the presentment, which both emanate from separation of powers. However, functionalists objected to the Court's wooden interpretation of separation of powers and argued that the decision denied governmental actors a flexible and efficient means of completing their responsibilities. In the end, scholars concluded that the importance of the legislative veto has been overstated or that Congress continues to fulfill its institutional role because it either found sufficient procedural substitutes or ways to circumvent the *Chadha* decision.

## Synonyms

Accountability; Appropriateness; Reasonableness; Responsiveness

## Definition

Public purpose: "A governmental action or direction that purports to benefit the populace as a whole" (Wild 2006, p. 212).

## Introduction

In a legal sense, the idea of legitimacy is fairly straightforward – what is legitimate complies "with the law; [is] lawful"; beyond this, what is legitimate is also "genuine [and] valid" (Garner 2006, p. 423). From a public administration perspective, though, the discourse over legitimacy has been fraught with disagreement and cries of crises facing the field on fronts of theory and practice. Given the place of administration in the public sphere, sometimes thought to be precarious given the unelected status of administrators, much time and effort has been allotted to defending public administration's role and function. Such efforts have shifted over time, from a focus on neutrality, expertise, and experience as a reservoir of authenticity and value in the carrying out of official function to an increasing need for administrators to be accountable on numerous bases – for their attention to particular needs, potential to play a valuable interactive role with the public, and yet to remain true to old standards of administration as the whims of public opinion may yet require. Rifts real and imagined are regularly part of the legitimacy discourse: rational versus responsive/participative, institutional versus strategic, efficiency and effectiveness versus morality, and particular interests attributed to the consent of the whole.

The landscape of public administration legitimacy has at various times been trying, with passionate insistence on the value of administration to the larger enterprise of governance and brusque refutations of such claims. Expectations for legitimacy in administration have changed along with the public's belief in what is valid and genuine about government, policy, and the relationship of the citizenry with the public sector. This entry assesses legitimacy and specifically legitimacy in public administration, reviewing historical shifts in this concept and highlighting views on public administration legitimacy relevant to the present.

## Legitimacy

Legitimacy may be defined as a "generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574). "Legitimacy is not a commodity to be possessed or exchanged but a condition reflecting cultural alignment, normative support, or consonance with relevant rules or laws" (Scott 1995, p. 45). For the public sector, legitimacy might be thought to be the difference between the capacity of administration to implement policy and the public's expectations for administration (Pierre 1993). Elsewhere, administrative legitimacy has been modeled as a four-part typology: administration and administrators serve as "instruments of presidential control," "experts... [at] apolitical problem solving," implementers of legislative command, and "forums for bargaining among diverse interest groups" (Seifter 2014, p. 447), and legitimacy derives from how well these functions are addressed.

In public administration, government actions by elected officials or administrators should serve a public purpose. Further, "an administrative agency's power to regulate in the public interest must always be grounded in a valid grant of authority" (Food and Drug Administration vs. Brown and Williamson Tobacco Corporation, 529 US 120 (2000)). This might include "constitutional and statutory grants and limitations subject to judicial interpretation," or if there is no clear view for or against about whether an activity is allowed, an assessment can be made about whether the activity or policy is reasonably related to activities specifically authorized by law (McCarthy 1995, p. 2–3). Judicial review has further informed and constrained the administrative process, particularly noting that "we must take care not to extend the scope of the statute beyond the point where [the legislative authority] indicated it would stop" (529 US 120).

Administrative legitimacy is typically associated with three ideals: "the rule of law, sound public policy, and democracy" (Arkush 2012, p. 611). With improved attention to the democracy ideal, administration has great and possibly unrealized potential to positively impact citizen's lives as well as to increase its own legitimacy. The next section reviews the historical basis of legitimacy in government.

## The Historical Basis of Legitimacy in Government

As mentioned at the outset of this entry, accord with law is the primary source of legitimacy. "What is actually legitimate in a well-developed, advanced society is the rule of law – the mechanisms, the procedures that have been established to govern it" (Pauker 1973, p. 3). Consent of the governed and right use of the authority of the public accorded to its government has historically been central considerations in discussions of legitimacy. In his *Second Treatise of Government* (1690), John Locke wrote that "all peaceful beginnings of government have been laid in the consent of the people." What makes a person a bona fide member of a society is freely given consent to be governed, "the better to preserve himself, his liberty and property." In exchange, government must agree that

> the power of the society. . .can never be supposed to extend farther, than the common good. . .whoever has the legislative or supreme power of any commonwealth, is bound to govern by established standing laws, promulgated and known to the people, and not by extemporary decrees; by indifferent and upright judges, who are to decide controversies by those laws; and to employ the force of the community at home, only in the execution of such laws, or abroad to prevent or redress foreign injuries, and secure the community from inroads and invasion. And all this to be directed to no other end, but the peace, safety, and public good of the people. (Locke 1690)

The American system of public administration has been described as "subordinated to democratic control and [therefore] must be responsive to public opinion" (White 1955, p. 23). The need to balance efforts to review and check administration from various quarters with labors to understand and respond to public opinion has been challenging. Historically, for legitimacy in the public sphere, a generally accepted assumption has been that "the part stands for the whole" (Rosanvallon 2011, p. 2). A working model of legitimacy of the public enterprise has been dependent on this distortion. This assumption plays a normative role in stabilizing a public sphere and its structures, even though it exists as a symbolic trope: the vote is a proxy for popular assent and a statement of the collective will of the entire. The people writ large do not "share identical, preconstituted ends. . .homogeneity is presupposed by the category of the People, and thus by the idea of the popular sovereignty itself" (Harmon 2006, p. 128). Homogeneity does not exist, and so the legitimacy project is essentially undermined, at least in the respect of popular direct consent, at its root.

This is problematic for purposes of discerning consent for administration. A system of voting cannot express the concerns of society as a whole; those that vote do not all agree with one another, and even if they do, what they say as a collective cannot be taken in any broader sense, as a total will beyond the people that voted. It is important to remember that consent given to administration is restricted and subject to change: "The disposition to obedience is general, but to the spirit rather than to the letter of the law, and to reasonable regulations rather than to those that interfere with custom and habit" (White 1955, p. 24). Efforts toward regulatory extremes may be seen as overreaching, even if they meet legal tests, because they fail to attend to common conventions of reasonableness. Extreme efforts to implement poor public policy can aggravate an otherwise docile public.

In more recent times, different senses of legitimacy have arisen – including values like "impartiality, pluralism, compassion, and proximity" (Rosanvallon 2011, p. 5). These shifts may have represented a coming to terms with the failure of classical legitimacy to achieve an accounting of the collective will of the people and an effort to make an effort to appeal to a populace increasing

dissociated from its role as citizenry. Calculating the needs of a public can be extremely difficult, even with local knowledge, a great sense of compassion on the part of public employees, and a commitment to public service. Further, [Social justice] "is very specifically defined by each society for itself at a given time" (Pauker 1973, p. 8). Even if achievement of general constructions of justice were possible for the whole of humankind, the small-t truth involved in defining what is just and fair at any given time, in a specific place, makes knowing justice when one sees it unexpectedly difficult. Merely seeking to provide justice, or impartiality and compassion, does not necessarily mean that the effort will produce the intended result or that the whole public will perceive the effort as intended.

For public administration, legitimacy is all the more complex given changing political views. Politics at least has the virtue of election of representatives by the people; public administrators are most often not elected, and their presence in the system of government over a period of hundreds of years has created some anxiety as theorists of the field have sought, to varying degrees of success, to sketch out the most legitimate place of public administrators, and in their best possible context in service to the public interest.

Within the public administration community, an early refuge was rationality and expertise. Public administration could be made to serve the common good, by developing the best processes to accomplish the work of governance, using the most efficient and effective means available. Wilson (1887) considered the work of administration to be the realizing of direction decided elsewhere, by political forces, and Goodnow (1900) further developed the idea of administration's place to suggest the best ways to accomplish the desired ends of political forces. Later, Taylor (1919/1911) brought forward scientific management with the notion of developing such "best ways" of accomplishing tasks. The early public administration literature gave rationality a solid foundation; in effect, science would save government administration the way it would save other aspects of life.

White (1955) observed that public administrators had increasingly taken on a professional guise, with specific training, professional organizations, and tenure in position. The professionalization of the public sector heightened the perception of the enterprise as legitimate: administrators were increasingly portrayed as skilled technicians employed in a merit system, implementing often complex policies, with their informed by professional codes of service.

It has been suggested more recently that the place of administration is also one of direct representations, given its role of daily interaction with the public on a street-level basis in the implementation of policy. Democratic governance might be best enabled not through a public service that exists solely as a rational implementer of policy, but through a public sector more aware of its "responsibility to serve and empower citizens" (Denhardt and Denhardt 2000, p. 549). Public administrators might have a better sense of the popular will through their daily close and specific relations than do elected officials often far-removed from the lived experience of citizens. Government should not concern itself exclusively with running its operations like a business, because it is not a business. "Public servants must attend to law, community values, political norms, professional standards, and citizen interests" (Denhardt and Denhardt 2000, p. 554). It is not sufficient to operate within the legal framework or accumulate self-interests as a proxy for broad public benefits (Denhardt and Denhardt 2000). In New Public Service literature, the shift from old public administration to New Public Management reverted back from a more purely efficient position to one that speaks to the role of representation of administration, and the difference between the merely legal basis of administration, to a basis in thought and action that is legal and provides for due consideration to appropriateness of the role of administration in the public sphere.

The next section looks at legitimacy in the practice of public administration, both within agencies and in the environment within which agencies operate.

## Legitimacy in the Practice of Public Administration

### Internal Legitimacy

It has been observed that public administration in practice operates as a "balance wheel" (Rohr 1986, p. 182), wherein administrative agencies select among sources of constitutional oversight. Meanwhile, administration has been expected to display "fidelity to the constitutional heritage," "disciplined discourse," (Rohr 1986, p. 192), as well as "professional competence" (Rohr 1986, p. 193). However, higher ideals are sometimes diminished by the need for attention to organizational survival: "[Administrative agencies'] preoccupation with the low arts of organizational survival blinds them to the brighter angels of their nature" (Rohr 1986, p. 182). Administrative agencies are thus caught in a bind – they are expected to be subordinate and accountable to the caprices of the political leaders of the present, but responsive to the demand that they remain above the fray and professional, avoiding political interference in the implementation of rules. Agencies are ideally expected to gain their strength from propriety and insight (Rohr 1986), but the ideals can only act as a rough guide for the practicing administrator. The administrator might advocate, but not too much. Administrators must follow the capriciousness of politics or risk accusations of lack of accountability. Even then, they must not act to the point where it becomes dangerous to the survival of the agency or the continuance of its mission.

A balancing exists between "taking initiative to achieve the goals of government... [and] action...informed by expertise" (McSwite 1997, p. 33) and responsibility through separation of administration from "elected representatives [that enunciate] policy as a meaningful 'whole' – providing self-contained statements that can serve as a basis for effective control and accountability" (McSwite 1997, p. 40); this recalls the Friedrich-Finer debate. Increasingly, as more was made of the dual nature of public administration, through indirect accountability to the public through elected officials and heightened expectations of direct accountability to the public through interaction and participation, administration has in some sense had to come to terms with its foundations and purpose. The field in practice may have been long content to portray itself as legitimated on the basis of technical expertise – as "Men of Reason" (McSwite 1997, p. 102) – but it is more appropriately part of governmental process, playing an essential role in bridging the social and political spheres and maintaining the stability of society, and legitimate on that basis. Even where a separation of power is advantageous in government, there are times when "appropriate use of independent moral judgment by public officials" (Tuckness 2008, p. 268), the sort favored by Locke, is also valuable.

### External Legitimacy

Managerial and regime values are both important and must be included in any effort to achieve legitimacy in governance, even if a precise, optimal mix of values is elusive (Feldman 2015). There is a general expectation among the public that managerial ends must not trump appropriate levels of attention to broader societal principles, such as those of constitutional standing. Administrators are wise to understand that the best way is not a purely technical tack, when there is a cultural expectation of adherence to societal values.

There remains the matter of how public administration may vary in the perception of its legitimacy depending on audience. Certain groups, particularly those that have had their specific concerns taken up by government through policymaking with programs and official structures enacted, may find the public sector and its administration to be proactive and pleasing. Other groups may feel disenfranchised, left out of official processes and proceeds, and find governments' machinations less acceptable. This unenthusiastic sentiment may tint how the public sees government and administration as a whole, even if a holistic view may suggest that government operates equitably, fairly, and efficiently. To make matters worse, there are segments of the population as a practical matter that are less involved in the exercise of voice to effect policy change. Class divisions that could be bridged by a proactive public administration, intent on

bringing citizens into the public policy process as active participants, instead become ingrained. Freedom and liberty may only exist for those well-off enough to become involved (Forster 1936). Such exclusion has been part of the public landscape for some time in many places around the world and has led to apathy: "In most countries the majority of people are fairly passive. They do not get deeply involved in public life. . .People just do not get that excited" (Pauker 1973, pp. 6–7). Illegitimate governments may consider the involvement of those who voice their opinions as a true statement of the broader consent of the government and thus take advantage of this lack of interest in the product of government. Without an involved and knowledgeable public acting as a check on, for example, a lack of adherence to the rule of law, governments may increasingly stray from their functional mandates and legislative authority. Some government actors desirous of self-serving gains may depend upon an uninvolved, alienated public, as apathy might simplify efforts toward corrupt ends.

The legitimacy of public administration may, like the broader public sector system, be viewed as a system more or less in equilibrium over time. As a public agency interacts with other agencies, branches of government, and its larger environment, the agency will at times be perceived as more or less legitimate. These fluctuations might have little to do with the agency itself or its actions, as quality of product in governance may be attributed to an agency given its environment: a poorly operated agency in an environment of excellence may be perceived as relatively better than a like agency surrounded by inferiority. What is perhaps most important for the agency is that disequilibrium may result in expectation of change – whether a change in leadership, program offerings, approaches to service delivery, or similar adjustments. Because the agency is informed by its past activity as well as its operating environment, it may be expected that such adjustments may require substantial effort, time, and resources to effect the desired change. Instances of substantial disequilibria may result in similarly large corrections (Johnson 1966). Another sort of disequilibrium, where legal aspects may be out of alignment with cultural expectations, within and outside the agency, may also yield disruption to operations. Social systems regularly experience disequilibria. However, the failure to recognize such phenomena – noting how programs and their results may be out of balance with what is reasonable and appropriate and therefore expected – is a hallmark of illegitimacy in the public sphere, whether or not the actions and culture of the governmental enterprise are legal and whether perpetrated by elected officials or administrators.

The connection of internal and external legitimacy is notable: "[organizational] members will seek to reduce any discrepancy between their perceptions of the organization...and their perceptions of the external image" (Breit 2014, p. 588). This can be considered as a form of sensemaking, as organization members attempt to reduce any cognitive dissonance that may be present between their view of their agency and its mission and the perceptions of their work held by the wider community (Breit 2014).

## Legitimacy of Public Administration as an Academic Discipline

Over the history of public administration as a self-aware academic discipline, significant attention has been paid to the legitimacy of public administration, tracking with the interest in practice. To the extent that public administration is taken in by the "Man of Reason" myth and a consuming belief in technical excellence of cost-benefit analyses and performance measurement, it trades some of its essential legitimacy and ability to properly account for the true human benefit of its efforts. Lives and citizen needs are not always directly translatable to simple calculations and balance sheets. Such banal approaches might serve only to "legitimize existing structures of rationality and power" (Denhardt and Denhardt 1979, p. 114), leaving people who desperately need to play a role in the public sphere out of the discussion and uninvolved and the larger goal of a democratic and representative government, at best, a fiction useful for its narrative value. As a

field of study, public administration does the practice of administration a disservice by insisting that the purely technical-rational is the one true way, or even a best way, forward.

From a theoretical viewpoint, the work of public administration as an academic pursuit might seek to help current or would-be practitioners better understand what is expected of them, well beyond technical skill or abstruse theory, and thus help them to increase their legitimacy. Instead, public administration literature, where it is out of touch, blares like a fire alarm about a crisis of legitimacy, and all the while the quiet, competent work of public administration moves forward largely unabated. As it is, administration might seem like it is arguing for its existence against an angry public, when no suitable alternative actually exists, and the public is not actually all that angry. The part does not represent the whole, even when the political sphere might find its interests benefitted from such rhetoric.

Where public administration theory has helped is noting that, for example, the crisis of administrative legitimacy might be more properly laid at the feet of the people generally, thanks in large part to a pervasive governmentality, where "political order is a product of the endlessly repeated microlevel production and reproduction of the models of representation whose very generation includes production and reproduction of the political order it precedes" (Catlaw 2005, p. 469). Legitimacy in such a state of affairs does not reside in vast narrative, but in the interactions between a citizen and an official, in the moment of service. Government, and the spirit of public service, is made and reified in such moments. The possibility of growth in public legitimacy exists in constant attention to a balancing of the legal, with policies that result in intended effects, and through means and methods that are appropriate and reasonable given the unique context for decisions, at all levels of public organizations.

## Conclusion

A government that has lost touch with its citizenry is engaging in behavior that tests legitimacy (Pauker 1973). The reason for public administration's move toward the local and participative is that there is a genuine need for open discourse and to welcome the public back into public administration. Perhaps the best way for a competent, skilled, and expert public administration to show its value to the population is, and perhaps has always been, for administration to be open and responsive: about knowledge, processes, and benefit to the cause of a just civilization. The careful balancing of the machinery of government, between lawfulness and due attention to appropriateness and reasonableness, can help assure legitimacy for the public sector across its diverse pursuits.

## Definition

Contemporary sources of validity, authenticity, and progress in public enterprises.

## Introduction

Modern public procurement fulfills a global host of societal, civilizational, and governmental agency needs. In the case of the United States, it all started with the Purveyor of Public Affairs Act of 1795, which first enabled the government to buy needed supplies and materials. While Congress has passed numerous public procurement regulations since, three major statues forge the field's foundational authority: the Federal Property and Administrative Services Act of 1949 (FPASA) (10 U.S.C. §§ 2301-2314), the Armed Services Procurement Act of 1947 (ASPA) (40 U.S.C. §§ 471-514, 41 U.S.C §§ 251-260), and the Competition in Contracting Act of 1984 (CICA) (41 U.S.C. §§ 253) (U.S. Government 2020). The ASPA oversees the acquisition of all property (except real estate), construction, and services by defense agencies. The FPASA, on the other hand, governs acquisitions by civilian departments and executive agencies not governed by the ASPA. CICA applies to both defense and civilian agencies. This third statute requires that the government achieve "full and open competition" wherever possible in the procurement process. CICA also granted the Government Accountability Office (GAO) as well as the General Services Administration (GSA) Board of Contract Appeals the ability to hear and decide bid protests. While the field's ability to enforce compliance flows from formal Constitutional authority, it is its legitimacy that grants an animating spirit. Legitimacy and authority are intricately intertwined but not synonymous. Both concepts entail power, and it is the warrant that grants the contracting officer (CO) constitutional power to administer a government contract.

The legitimacy of governmental action is a narrative as ancient as the musings of Plato (Friedrich 1972). This narrative continues to evolve and expand, and certain thinkers have served as architects driving forward the social

science within. Debatably the leading social theorist of the twentieth century, Max Weber developed a tripartite theory in 1922 for sources of legitimate government. His theory's general categories are "traditional," "rational-legal," and "charismatic" (Weber 1922). They correspond with three concrete means of validation found in modern public procurement. This trio consist of the ability of vendors protest a bid award, field professionalism, and a public approval-oriented upholding of the public interest. The tenants of credibility, efficacy, and transparency undergird both these three means and the rhetoric of investing in this increasingly essential mechanism of modern government. Understanding public procurement's role and mechanisms in government, as well as its essential values, are keys to formulating meaningful progress and skillfully crafted reform within its public service.

When tax money crosses the private–public barrier in order to be apportioned for profit-oriented commercial activities, it is public procurement's legitimacy that enables it to fulfill its ethos: To wisely spend taxes. Recent estimates place the United States' state and local procurement spending at over 1.7 trillion dollars (GAO 2017) and the federal at over 550 billion (GAO 2017). Prevailing trends indicate a growing governmental preference for a privatization of the social support projects necessary for a democratic constitutional republic to thrive. This field's contemporary relevance extends globally; as of 2012, public procurement spending has grown to represent over 18.42% of the total world GDP (Mahmood 2010). Cracks in the edifice of public procurement are found in three forms. The first is a form of market failure – the asymmetry of information – between the bidding vendor and the procuring agency (Mahmood 2010). From this imbalance arises the issues that surround contract theory's moral hazard, adverse selection, and plausible deniability (Melese 2018). This asymmetry and its related issues are the core reasons why legitimate public procurement regulations and a consistent rule of law are so vital. Currently, in the United States, the most relevant body of rules rests in the Federal Acquisition Regulations, promulgated by Congress in 1984. The FAR's overarching vision for public procurement is fourfold: "Satisfy the customer in terms of cost, quality, and timeliness of the delivered product or service. . .Minimize administrative operating costs. . .Conduct business with integrity, fairness, and openness; and. . . Fulfill public policy objectives" (FAR 1.102(b)). This expansive code, its references, and its specialized subsections guide government acquisitions nationally (USGSA 2020). However, these federal codes are not ubiquitously perceived nor accepted as sufficiently comprehensively applicable for the localized public procurement at state and local levels (Tukamuhabwa 2012; Sutinen and Kuperan 1999). While the FAR does enjoy precedence in the case of an intergovernmental conflict, the vast majority of public procurement activities and appeals remain, by regulation, within the arbitration boundaries of their originating level's jurisdiction (Duvall et al. 2013). While there is a consistency and utility benefit arising from a standardized body of regulation, legitimate modern public procurement is far from a one-size-fits-all strategy. Here, specialization well serves the aims of effective public procurement (Russell and Meehan 2014). One community's needs, in a diverse complex nation, is rarely identical elsewhere. The second weakness, especially in complex contracts that are broad in scope, lies in the uncertainty inherent to the principal-agent relationship (Brown, et al. 2015). A third weakness exists through the need for a sufficient threshold of public trust (Hunsaker 2009).

Understanding the roots of public procurement's legitimacy informs the scientific designing of meaningful reforms that progress good government and its ideal spending patterns. In an era of increasing inter-connectedness, media vigilance, and competing ideologies – this is relevant. The willingness of involved agents to comply with the contract, as well as regulations, is based on the perceived legitimacy of the authorities charged with implementing those regulations (Sutinen and Kuperan 1999; Tukamuhabwa 2012). Institutional rhetoric is essential for the existence of any group that claims to perform public service. In a world of myriad competing demands for resources – one tax dollar spent

implies one not spent in another realm. Legitimacy in public procurement is assured by three foundational elements. Firstly, there is the bidding vendor's ability to protest a contract award is the first; this signals a legitimacy via transparency. Secondly, there is the professionalism of public procurement professionals; this signals a legitimacy via credibility. Thirdly, there is the commitment to the public interest; this signals a legitimacy via efficacy – which is the spirit of representative government.

## Recourse for Bid Protest

Increasing implementation in e-procurement has served as an aid to ensure that all salient contract data is communicated in a prompt, clear, and comprehensive manner so that a bidding vendor may enjoy a fair and reasonable window with which to challenge award decisions (Bromberg and Manoharan 2015). In the hands of fallible humans, this facet is doubly critical in the event that a contract fails; and failure does occur. A transparency of communications and data serve the reviewing courts well in ensuing legal battles. For courts seeking to hold government accountable to itself, the litmus test in each disputed case is whether an agency action and accompanying legal conclusions are found to constitute an arbitrary and capricious abuse of discretion that flows contrary to the procuring agency's constitutional right, power, privilege, or immunity (5 U.S. Code § 706). If so, that agency breaks its warrant and thus loses any claims of sovereignty.

Sovereignty is an ultimate mandate of authority that once was reserved for aristocrats claiming divine right or despots claiming an expediency of security (Greenleaf 1957). That sovereignty now rests divided among three fragments within the United States' government, and each agency may extend that power of sovereignty to satisfy individual agency needs. Public procurement occurs at all three key levels of local, state, and federal. A common thread across all sovereign representative authority is a primal responsibility and accountability unto each dollar spent. Legitimacy theory posits that the procuring agency is responsible to disclose its practices to stakeholders – particularly to the public – and to justify its role within society (Tukamuhabwa 2012; Russell and Meehan 2014). For this reason, the tenant of transparency informs a credible bid protest and timely appeals process. Regarding increasing volumes, the United States Court of Federal Claims (COFC) and the United States Government Accountability Office (GAO), the two principal *protest venues* for bid protest, experienced a dramatic increase in bid protests in response to awarded contracts. Across the years of 2001 to 2012, protests filed by interested parties rose from 1,146 to 2,475, with an inversely correlated effectiveness rating that sank from 42% to 33% (Stein 2014). The GAO first commenced accepting bid protests in the 1920s (Stein 2014). Since then, Congress has authorized three distinct bid *protest venues* for an unsuccessful bidding vendor: The procuring agency, the GAO, and the COFC (FAR 33.101) (31 U.S. Code § 3552). US District Courts do not have any bid protest jurisdiction. A capable, responsive, and accessible bid protest process is essential for the legitimacy of public procurement, and investment is needed in order to keep pace with rising demand. As for state and local levels, the recourses for bid protest remain largely inconsistent and unique to the agency and office (Melese 2018). Using a review body with specific expertise of professional industry knowledge to handle complaints reinforces the legitimacy of award decisions while simultaneously augmenting the government's responsiveness to formal protests. Additionally, alternative resolution mechanisms are established to encourage informal problem solving and thus avoid costly reviews, public embarrassment, and pitched legal battles (OECD 2009).

Over the past few decades, the United States has advocated for the adoption of bid protests systems and thus accompanying enhanced public procurement legitimacy (Melese 2018). The World Trade Organization's "Agreement on Government Procurement" now requires that its members ensure that a functioning bid challenge system be in place. Article 9 of the United Nation's Convention Against Corruption now specifically calls for an effective system of

domestic review and appeal for unsatisfied private bidders (OCED 2009; GAO 2017). Although bid protests may seem to merely raise costs, compound delays, and incite adversarial relations – bid protests are a contemporary and proven means not only for holding public administration officials accountable but also for expanding vendor/citizen participation in the acquisition process (Hawkins et al. 2016; Melese 2018; OECD 2009). Multiple forums for protest are necessary as each watcher requires a watcher. Procuring agency protests are generally viewed with disfavor by vendors and are, in practice, seldom used compared to other forums (Melese 2018; GAO 2017). Despite the rise in bid protests in recent years, only a small percentage of federal awards are protested via the GAO, which contains a finite processing capacity (Hawkins et al. 2016). Furthermore, the percentage of successful protests that result in an eventual award reversal are even smaller. The prospect of an adverse GAO decision drives many agencies to act more deliberately for a prompter corrective action, when a credible protest does emerge. Although the GAO is by far the most popular bid protest forum and is generally acknowledged as the leading authority on federal contract formation issues, the COFC offers an alternative bid protest forum as well as a largely de novo review (Melese 2018). Bid protests at the COFC are not limited to 100 days, as they are at the GAO (Yukins 2017). However, bid protests via the COFC often constitute a more expansive and thus more costly process to litigate (Hawkins et al. 2016).

## Professionalism

Elected officials are unable to effectively nor efficiently adjudicate their funds if they also seek to maintain their seat, deliberate policy, and guide the spirit of a nation. The warranted, legitimate, and professional contracting officer CO serves as both the gateway guardian and the keeper of the rules. In AD 605, the Sui Dynasty of China saw the rise of the first civil service (Roberts 1999). Since then, specialization and delegation have evolved to become integrated as core elements of proficient public administration. While elected officials are the original source of representative authority for a CO, it is a Senior Procurement Executive (SPE) who issues the empowering warrant. The Agency Head appoints the SPE, appointed pursuant to 41 U.S.C. 1702(c), as their designee to delegate that warrant as the FAR indicates that warranting authority is delegable (Yukins 2017). The SPE then authorizes a Head of Contracting Authority (HCA) to further extend that warrant to the Commissioners and Deputy Commissioners of the Federal Acquisition Service, the Public Buildings Service, and the Chief Administrative Services Officer. The HCA establishes budgets for CO training plans, monitors CO performance, and appoints the members who constitute the Contracting Officer Warrant Board. It is this board that ensures that all criteria of the Federal Acquisition Certification, as directed by the Contracting Officer Warrant Program under the Office of Acquisition Policy, have been met by a CO candidate before the warrant is granted (FAR 501.603-2(a)(1)). Complicated as it may be this unbroken hierarchical chain of warranting authority seeks to assure mutual vigilance and accountability – elements that are essential to the professional legitimacy of contracting professionals and their field. The tenant of credibility imbues the COs' warrant with the sovereign authority to legally and financially bind the government financially to a legal contract (Yukins 2017). Legitimacy animates the good-faith relations contained and the trust required to harmoniously accomplish the public procurement professional's civic promise that they are performing to best satisfy the customer, their people.

## Public Interest

Public procurement faces a publicity challenge. Subpar levels of public trust not only necessitate a thickening of onerous and costly red tape; but also this poor trust impedes well-intended reforms to meaningfully affect progress serving the public interest (Hunsaker 2009). In 2016, the Organisation for Economic Co-operation and

Development (OECD) described that public procurement is among the most corruption-prone government activity in existence. In 2019, Rustiarini et al. expounded the "fraud diamond view" that corroborates this facet of the field as well as how lucrative collusion remains. Public procurement is indeed a high-risk area for fraud – particularly within the government institutions. Situational factors of pressure and opportunity interact with psychological aspects of rationalization to enable an individual capability to commit fraud. With each scandal, legitimacy takes a hit and positive progress is muddled by kneejerk reforms that seek to maintain signaling a representing of the public interest (Rustiarini et al. 2019). The OECD in 2005 observed that it is difficult to combat fraud and corruption in public procurement if a group of individuals collude, with common interest, in maintaining secrecy. Indeed, the sheer volume of transactions, the financial interests at stake, and "the complexity of the process, the close interaction between public officials and businesses, and the multitude of stakeholders" align to make public procurement resistant to simple solutions aimed at purging corruption and or boosting representativeness (OECD 2016; Brown et al. 2015). When government awards a contract, it does more than to merely entrust a private enterprise to perform the work of the people. Funding is the lifeblood and incentivizer of a good society that is promoted by the administrative efforts of organized public service. When the government opens its treasuries to outside private businesses, that procuring agency not only endorses but also stakes its own credibility on the contract consequences (Sutinen and Kuperan 1999).

This concept of legitimacy and upholding the public interest is not inherent to any single project at any particular realm of governance (Russell and Meehan 2014). Rather, it collectively emanates from the individual actions of all members of the Acquisition Team; which includes not only representatives of the technical, supply, and procurement communities but also the customers they serve, and the contractors who provide the products and services (FAR 1.102(c)). The modern procurement specialist's ethos is marked by a professional blend of technical expertise, legal authority, and a visible commitment to carrying out the will of their elected government, and their agency's dominant ideological priorities (Russell and Meehan 2014). Additionally, to further an adherence to the public interest and the accompanying legitimacy benefit, public procurement is also utilized as an instrument of innovation. Innovation signals the sincere achievement of a greater efficacy and efficacy in spending tax dollars. Agencies may place an order for something that currently does not exist. This idealized product thus enjoys a potential source of funding as well as a fiscally incentivized impetus for development. In the 1990s, this phenomenon was known as "public technology procurement" (Edquist 2009). This term "technology" has evolved to be replaced by the concept of "innovation"; that is, using public demand to spark innovation (Edquist 2009).

## Conclusion

The field and profession of public procurement is an exemplar of a social science. It is an art, science, discipline, and – most essentially – a public service. The scientific aspects are most clearly revealed via the intellectual scholarship that encompasses systematic studies of not only its structure but also the sum of humanity's conduct within. While the scientific method does remain relevant here, observation and experiment compose but a part of this archetype. To treat public procurement merely as a hard science (e.g., chemistry) would omit the social, artistic, and public service elements. To elucidate the legitimizing pathways and signaling ideological ethos, phronetic research of core presuppositions reveal both the core values and most salient issues that impede the achieving of a greater representativeness unto the public interest (Russell and Meehan 2014). Legitimacy derives from the degree that the affected communities believe in the validity of public procurement to both advance society and better civilization. This is where the public service performance element is most evident. The art element exhibits itself via the myriad relationships

and intangible good-faith norms that are established with each action and omission. This cultural characteristic infers a guiding principle that is endemic not only to the social sciences, but also government's establishment of generalized laws and regulations. With human behavior as the beginning, means, and end – the administrative and political capital expended on a reform is bound for disappointment if the only litmus test be the impact of technical efficiency gains or shrunken budgets. Optimization, given the core sources of modern public procurement's legitimacy, may take many forms and appear limited – especially in the short term. Signaling matters. Each well-considered reform to the global public procurement paradigm encourages a communal momentum – and most importantly – signals a renewal to the commitment of legitimacy and active progress (Russell and Meehan 2014). Also, contained within the civic promise to wisely spend tax money is the quest to mitigate the greatest recurring issues of contract theory: information asymmetry, moral hazard, adverse selection, and waste. By breaking down, the poorly performing ideas and replacing them via innovating novel ones, public procurement professionals advance their field and the governance's holistic dialectic (Edquist 2009). In the field of public procurement and its legitimacy, the whole is greater than the sum of its parts.

## Lesbian, Gay, Bisexual, Transgender, Queer (LGBTQ+) Workplace Policy

Nicole M. Elias
Department of Public Management, John Jay College of Criminal Justice, City University of New York, New York, NY, USA

### Synonyms

Gender; Gender identity; Gender inclusion; Gender nonconforming; Gender variance; LGBTQ+; LGBTQ+ workplace policy; Sex; Workplace inclusion

### Definitions

| | |
|---|---|
| Bisexual | Sexual attraction to two or more genders |
| Cisgender | A cisgender person is a person whose gender identity and sex assigned at birth are in alignment |
| Gay | A man or man-aligned person who is attracted only to men or men-aligned people |
| Gender identity | A perception and presentation of one's own gender |
| Gender inclusion | Equity, fairness, and representation of all genders |
| Gender nonconforming | A gender nonconforming person is a person whose gender identity and/or expression is not typical according to mainstream gender norms. A gender nonconforming person is not necessarily a transgender or gender variant person |
| Gender variance | A synonym for gender nonconforming, a gender variant person is one whose gender identity or expression does not conform to traditional gender norms |
| Gender | A social construct that assigns physical and behavioral characteristics based on one's sex |
| Lesbian | A woman or woman-aligned person who is attracted only to women and women-aligned people |
| LGBTQ | An acronym that represents lesbian, gay, bisexual, transgender, and queer people. The + symbolizes the numerous other gender identities and sexual orientations that are not listed but included in this umbrella acronym |
| Queer | Often used as an umbrella term to encompass all LGBTQ+ identities. People in the LGBTQ+ community may use "queer" to describe themselves, meaning they are not heterosexual and/or cisgender |
| Sex | A binary categorization based on physical and genetic characteristics such as genitals and chromosomes. Traditionally, "male" and "female" sex categories |
| Sexual orientation | The gender or genders to which one feels sexual attraction |
| Transgender | A transgender person is a person whose gender identity does not align with their sex assigned at birth |

## Diversity Management in the Public Sector

The definition of "diversity" has broadened over the past two decades, departing from a historical focus on demographic factors such as race and ethnicity to include the following individual attributes: socioeconomic status, culture, gender, job role, education, profession, age, and ability (Elias 2013; Ozturk and Tatli 2016). With this expanded understanding inmind, diversity management involves strategic organizational efforts to support and value difference within agency culture, policy, and practice. Simply recruiting and hiring employees who fit specific demographic categories is no longer a strategic method for managing diversity (Hand 2010).

An effective diversity management program must be integrated throughout the institution, with programs, trainings, and organizational behaviors that consider the unique contributions of individuals within the entire organization (Hand 2010). Ongoing practices of diversity management move beyond promoting diversity and inclusion in the workplace to more pragmatic tools for building social equity across organizational cultures and ideals. In public administration, scholars have shown how diversity management may be expanded at the educational level to challenge existing concerns of status quo that hinder the success of marginalized groups within society (Hand 2010). Key to the broader definition of diversity management is cultural competency (Elias 2013; Hand 2010). Specifically, public agencies should have cultural competency throughout various processes and policies to be truly welcoming of diversity and promote a place of inclusion.

There is burgeoning research on diversity management within the public sector. Key areas of the literature range from exploring the value of diversity (Blessett et al. 2013), representative bureaucracy, or examining how representation functions within the workplace (Elias 2013), and proposing and critiquing means of enacting diversity in public organizations (Elias 2017).

Many diversity programs initially focused on affirmative action implementation (Thomas 1990) but had historically not targeted the assessment of implementation (Choi and Rainey 2014). An effective diversity management program includes an evaluation of its programs, looking at how social equity and organizational fairness are integrated into policy and procedure. Organizational fairness administered throughout a public agency's diversity management program has been shown to increase employee satisfaction (Choi and Rainey 2014). Women tend to indicate higher satisfaction than men when their companies properly manage diversity with organizational fairness (Choi and Rainey 2014). The field of public administration has witnessed shifts in employee programming, from a focus on historical factors such as efficiency and integrity to the theory of new public administration. With this shift has come a focus on diversity with an ever-broadening definition to meet the growth and fluctuations of the interconnected, ever-expanding, twenty-first century environment. This shift, driven by ongoing social, political, and cultural factors, promotes new conceptions of identity and representation and encourages public administrators to consider next steps of diversity management. A central concern is integrating new identity categories into diversity definitions, policy, and programming. LGBTQ+ identities are in need of greater diversity management attention and inclusion in public sector organizations.

## History of LGBTQ+ Public Employees

Substantial challenges exist to offering an organizational culture that integrates diversity management into all levels of its practices, particularly for transgender and transitioning employees (Ozturk and Tatli 2016). Some of these barriers may include existing marginalization of transitioning and transgender individuals within the broader LGBTQ+ community (Ozturk and Tatli 2016). Staggering statistics indicate that ongoing discrimination of transgender employees within the workplace is a cyclical practice, with the National Transgender Survey reporting that 90% of survey takers had been harassed at work, and 26% of

those who took the survey had lost their employment because of their transition (Tuttle 2015). Many of the existing challenges within the field of public administration are a direct result of historical policies that discriminated against LGBTQ+ individuals within the workplace. Such discrimination was inherent in federal agencies, during the "Lavendar Scare," a time in which a number of gay individuals were forcibly removed from federal government service (Elias 2017). By November 1950, what came to be known as the "purge of the perverts" resulted in more than 600 federal employees losing employment because of their sexual orientation (Elias 2017). Following this policy, President Eisenhower's "Let's Clean House" campaign included removal of individuals who were gay or lesbian, at that time considered to have a "sexual perversion" (Elias 2017). After such blatant discrimination, the Civil Service Reform Act of 1978 passed, which in 1980 through court proceeding, was determined to apply to the category of sexual orientation (Elias 2017).

Following executive orders issued by former President Obama, some diversity policies simply provided employees the option to choose the bathroom that best met their gender identity (Tuttle 2015). However, programs now need to move beyond acknowledging the minimal steps of equality such as bathroom and locker room use, to holistically considering how organizations can move toward a culture of diversity and inclusion. Such policy initiatives should consider how cultural competency can move an organizational culture toward a broadened perspective of diversity (Elias 2017). While many public administration agencies, especially at the local government levels, may not yet have addressed transgender policy on an agency level scale, it is imperative for public administration agencies to proactively adopt policy and procedure that provides employees information about who to meet with and contact when planning a transition (Elias et al. 2018). Among other concerns, the agency should address locker and restroom policies appropriately, and dress code should remain fluid as to not cause discriminatory practice (Elias et al. 2018).

Because of ongoing stigma associated with transitioning identity, individuals who are transgender or transitioning may consistently live disclosure disconnects – where the identity displayed in one aspect of a person's life, such as home or community, may not match the identity reflected in the workplace (Ozturk and Tatli 2016). This may cause stress and result in additional hindrances to understanding the needs of transgender and transitioning employees. Public administrators must consider the need to implement policy that welcomes transitioning employees into the workplace. There are approximately 1.4 million people living in the USA who identity as transgender (Flores et al. 2016). The need to appropriately revise and update outdated policies that may marginalize employees who do not fit their traditional sex and gender categorization cannot be overlooked in today's ever-expanding definition of diversity.

After a long history of discrimination stemming from many actions of the 1950s, new policies have been adopted that protect sexual orientation within the workplace. However, oftentimes such policies do not speak to the topic of gender identity within the work environment (Elias 2017). As of 2014, a number of States have not taken necessary measures to adopt laws that ban discrimination in the workplace based on sexual orientation and gender identity (Mihelich 2014). In 2012, the US Office of Personnel Management began asking employees, through the Federal Employee Viewpoint Survey, about LGBTQ+ demographics. The addition of this question represented a key turning point in US policy and practice relative to employees' perception of the federal government's LGBTQ+ policies. The data gathered through the inclusion of this question since 2012 has been used for various public administration initiatives (Elias 2017). Although the addition of this question has been significant for the study of LGBT topics within the federal workplace, it has also shown how little information is available about the LGBT population within the federal workplace (Elias et al. 2018). This lack of data was exacerbated by a historical stigma on LGBT matters within the workplace (Elias 2017). Considering the troubled

history and challenges with accurately representing the LGBTQ+ population, integrating LGBTQ+ identities into diversity management practices becomes a pressing concern in the public sector.

## LGBTQ+ Diversity Management

Over the past two decades, there has been much scholarly discussion about gender diversity and how best to enhance gender diversity within the workplace through recruitment, management, and programming that focuses on flexibility for family needs within the workplace (Brotherton 2013), distribution of equitable benefits to LGBTQ+ employees, and to employees in same-sex marriages. Much of this literature has centered around the pay gap between cisgender male and female workers, and how this pay gap may be systemically engrained in agency culture (Bishu and Alkadry 2017). However, organizational culture, policy, and practice that target transgender, transitioning, and nonbinary employees within the workplace are growing categories of research within the public administration field.

While the federal government has paved the way to collect data on LGBTQ+ populations, in many cases, state and local governments remain far behind implementing policies that are friendly to transitioning individuals. Several projects have attempted to address this apparent research gap, which is evident both here in the USA as well as in the UK (Cravens 2015). Others have shown how the intersection of federal, state, and local government laws about transgender policies and protections can interact and sometimes conflict (Taylor 2007). Additional research is needed on policy changes to better manage diversity initiatives for LGBTQ+ public servants (Elias et al. 2018).

Despite the need for public administration agencies to adopt LGBTQ+ policies, a number of state and local governments have yet to take such measures. Although reasons for not adopting LGBTQ+ policies have historically cited organization size, researchers have shown that other factors, such as internal dynamics of an organization, broader community culture, partisanship, and competition are all factors that may influence adoption of LGBTQ+ policies. The adoption of LGBTQ+ policies is strongly correlated with advocacy and interest groups (Cravens 2015). Many employees in the transition process experience employment challenges because of lack of organizational support, both within the workplace and within the context of the broader organization (Elias et al. 2018; Ozturk and Tatli 2016). Among these challenges is silencing of LGBTQ+ employee voices within the broader organization. All public agencies should realize the need for clear procedures that impact a transitioning or transgender employee. Concerns about dress code, bathroom and locker room use, as well as any organizational policies that are gender specific may be particularly pertinent for transgender and transitioning employees. The sections below detail the need for proactive transition plans, bathroom and locker room usage, and dress codes that an agency should consider when adopting policies for transgender and transitioning employees.

### Transition Plans

The workplace culture of many public agencies that consider traditional cisgender approaches within policies and procedures, work attitude, and culture may cause challenges to employees transitioning within the workplace. Specifically, if transgender employees do not identify within the binary male-female dynamic, but instead present a more gender fluid approach, colleagues may be intolerable of the employee's behavior and presentation (Elias et al. 2018). Other concerns poignantly impact transgender employees' work experiences, such as being harassed, receiving inadequate support within the management of the public agency, and being subject to outdated and irrelevant human resource policies that do not pertain to the transgender employees' experiences (Elias et al. 2018). There has been little research on how to best train employees within the workplace to understand the needs of transgender employees, and the particular needs of

transgender employees who are in the transition process (Elias et al. 2018). Such diversity training should promote cultural competency within the workplace, with an inclusive environment where a transgender employee feels comfortable and supported to openly converse with coworkers about the decision to transition. Many transgender workers experience fear surrounding the initial decision to transition, with top concerns about experiencing prejudice, losing work experience completed before their transition, and losing their employment because of the transition process. Additional concerns apparent within workplace culture occur when a transgender employee transitions not from male to female or female to male but from female or male to nonbinary. The transgender employee who identifies as nonbinary within the workplace may experience increased challenges and harassment as coworkers judge appearance and behavior against gender norms (Elias 2017; Elias et al. 2018). Agencies that do not have policies, procedures, and training with the goal of inclusivity and cultural competency severely lack the ability to properly support an employee through the transition process. Moreover, public agencies that are not prepared with a transition plan to support all of their employees may lose employees who are valuable assets and may face legal concerns because of lack of agency support.

Without a plan of how best to work with the employee during the transition process, the transition has the potential to be more challenging for both the agency and employee. The majority of federal, state, and local agencies have not taken the necessary steps to formulate a transition plan (Elias 2017). Employees may be left wondering how to properly reflect their new name on agency records, and employers may experience difficulty changing all of the records of the employee's information. Without a plan, agencies may struggle with how best to support the transitioning employee. Agencies should clearly define the contacts and resources for transitioning individuals. This type of plan provides the agency with the organizational readiness to properly assist and respond to a transitioning individual. For the employee, it provides a level of security. For coworkers, such policy should provide a training and expectations portion (Elias 2017).

### Bathrooms and Locker Room Usage

The "bathroom issue" has captured the national spotlight, particularly with North Carolina's House Bill 2 (House Bill 2 is titled "An Act to Provide for Single-Sex Multiple Occupancy Bathroom and Changing Facilities in Schools and Public Agencies and to Create Statewide Consistency in Regulation of Employment and Public Accommodations. House Bill 2 was subsequently repealed by House Bill 142.) which banned bathroom use based on gender identity that did not correspond to biological sex assigned at birth. Since 2016, this Act has been declared unlawful under the Civil Rights Act, Titles VII and IX, and under the Violence Against Women Reauthorization Act of 2013. Confusion among agency leaders is not an excuse for denial of bathroom access and is considered discrimination. Agencies may take additional steps to ensure all have access to safe and comfortable bathrooms by renovating such facilities (Elias et al. 2018). Agency policy should clearly define that individuals who are transitioning do not have to have undergone specific medical or surgical treatment to use the restroom or locker room facilities that best fit their gender identity (Elias et al. 2018). For transitioning and transgender employees, bathroom and locker room use can pose a daily challenge depending on the organizational policy or lack of policy. Oftentimes, a transitioning or transgender person's appearance may not match their sex assigned at birth and entering a gender-specific bathroom that does not match someone's gender identity may cause the person to experience harassment. Even if a person is not specifically harassed for entering and using a bathroom or locker room that does not match their preferred gender, they may be subject to other types of reactions and comments by coworkers. This can lead to an uncomfortable or hostile working environment. A method to mitigate conflict surrounding bathroom and locker room usage at work is to define policies for the use of these

spaces. Oftentimes, transgender employees have been prohibited from using the restroom that matches their gender identity. A 2015 Equal Employment Opportunity Commission, in *Lusadi v. Department of the Army*, that an individual's access to a bathroom after transition is protected under Title VII of the Civil Rights Act of 1964. Furthermore, employees and supervisors who do not agree with a coworker using the bathroom that matches their gender identity after transition is not a valid reason for an employer to use to deny access to the restroom that matches that employee's gender identity (Elias 2017). To fully implement a diversity management solution that fully accounts for the needs of transgender employees, a transgender policy should include a provision that no employee may be denied access to the restroom or locker room that fits their gender identity. The agency should not require proof of transition or other medical procedure to allow access to the applicable restroom or locker room (Elias 2017).

### Dress Codes

It is imperative that when an employee is planning a transition process, the agency supports that person with a set of policies and procedures that is relevant to transgender experiences. Training should be offered to employees to ensure they are aware of the needs of transgender individuals, before and after the transition process. Agencies' dress codes should consider gender fluidity and needs of transgender employees, to ensure that an agency is not incorrectly requiring someone to dress according to their sex assigned at birth, rather than their current gender identity (Elias 2017; Elias et al. 2018). Additionally, dress codes should not require grooming or clothing-specific requirements based on an employee's gender or gender identity. Implementation of any dress code policy should consider all employees, regardless of gender identity, and allow for fluidity in gender identity and presentation. Agency policies should allow for flexible dress codes that provide all employees the option to wear loose-fitting clothing that does not reveal biological sex. Such a policy should state that employees will not be required to dress in conformance with any specific gender identity.

### Next Steps for Transgender Inclusion

Public administration agencies should adopt comprehensive LGBTQ+ diversity management policies and practices to be inclusive of transgender employees. At a minimum, transgender policies should account for practices relative to an employee's transition, bathroom and locker room use, and dress code. These are only three of the most pressing issues that need greater attention and should be included in agency policy. Other considerations include more informal interactions, how personal pronouns will change after or during a person's transition, record keeping, and anti-harassment statements (Elias et al. 2018). Creating a transgender-inclusive workplace requires organizational changes that include personnel, policy, legal, and medical issues unique to transgender people (Colvin 2007).

Because their gender identity does not often match their sex, transgender employees face high levels of discrimination, violence, and harassment. The workplace is considered one of the riskiest places for transgender individuals (Colvin 2007). Public administration agencies, especially at the state and local governmental levels, have been rather slow compared to private organizations, to adopt antidiscrimination policies (Choi and Rainey 2014). In cases where such policies do exist, enforcement may be either lacking or nonexistent (Colvin 2007), which may feed into the cyclical pattern of discrimination. In cases where agencies have adopted antidiscrimination policy, these policies may not speak to the specific needs of transgender and transitioning employees within the workplace. Policy for transgender and transitioning employees should move beyond antidiscrimination policies, to provide equal access to health care and other benefits, such as sick leave, policies to update personnel records and organizational contacts to make the transition process at work more smooth (Colvin 2007).

Public service organizations should look to implement employment practices and cultures of

inclusivity for LGBTQ+ employees. Public administrative agencies should be proactive by adopting a set of standard procedures that provide employees and supervisors with information on who to contact to obtain agency policy and available resources. Such procedures should include one point of contact to change all applicable gender records for the transitioning employee(s), to ensure the agency and employees each have clear information on what processes to follow. Agencies that implement a transgender policy will also promote awareness among colleagues about the needs and concerns of transgender employees within the workplace. Public agencies should further promote safe environments for all individuals, by establishing clear guidelines on bathroom and locker room use.

To be effective, public agencies should craft policy that takes into account the perspectives of LGBTQ+ employees and addresses the unique needs of transgender employees. All employees should be respected and safe in their work environments. Without implementation of policies that consider the entire agency population, an organization cannot effectively establish a safe and welcoming environment for transgender employees (Elias et al. 2018). Central to this goal is keeping communication open and fluid among leadership and employees at every level of the organizational structure. LGBTQ+ advocacy groups and employee resource groups are critical points of contact for beginning to understand the needs and LGBTQ+ employees and devise policy that speaks to these needs. This emergent policy area will continue to evolve with the help of supportive leadership and members of public organizations who feel comfortable to pose questions, voice concerns, and share experiences that result in more inclusive and supportive diversity management policy and practice.

# Levels Within Elites

Ilkka Ruostetsaari
School of Management, University of Tampere, Tampere, Finland

## Synonyms

Inner circle; Oligarchy; Power elite; Ruling class; Upper class

## Definition

Researchers on leadership have presented numerous definitions of an elite. Here elite refers to people who by virtue of their strategic position in influential organizations or in formally non-organized social groups are capable of regularly exercising influence on the formation of significant societal decisions.

## Introduction

The essence of classical elite theory can be reduced to Gaetano Mosca's (1939, 50) claim that there are in all societies two classes of people: a class that rules and a class that is ruled. Elite theory and study on elites have been criticized for working with an overly simplistic division between elites and the mass, with the former thought to hold power and the latter thought to be excluded from power. Although elements of such thinking can be detected in the best-known works of elite theory, the elite position is not a black-and-white, either-or proposition. Elite theory can well work with a more complex and multilayered conception of power (Etzioni-Halevy 1993, 29). The aim of this entry is to assess different levels or strata within the elites and their interrelationship.

## Classical Elite Theory

Many elite theorists distinguish between two levels or strata of power within the elite. Such a distinction appears in Mosca (1939), Pareto (1963), and Mills (1956), although with some variation. This represents an attempt to take account of differences in the degree and the type of influence wielded by elite members. In some cases, the lower stratum of the elite serves as a bridge between the core of decision-makers and the rest of society. It mediates between the rulers and the ruled, transmitting information in either direction and providing explanations and justifications for elite policy. Furthermore, it may be the source from which the higher elite is recruited as well as the level at which outsiders first enter elite circles from below (Parry 1969, 33).

C. Wright Mills (1956, 288–290), for example, makes a distinction within the power elite between an inner circle and outer fringes. The inner circle consists of those who interchange leading roles at the top of various institutions in politics, business, and the military. The outer fringes of the power elite consist of "those who count," even though they are not involved in making decisions, nor do they move from one role to another between institutions. In his studies of the political role of large business corporations in the United States and the UK, Michael Useem (1984, 61) has likewise identified among top executives an inner circle that "constitutes a distinct, politicized business segment, if a segment is defined as a subset of class members sharing a specific social location with partially distinct interests."

Elites (and, by implication, elite theory) have been described as the antithesis of democracy. According to Mosca and Pareto, a prime aim of their work was to demolish the myths of democracy (Parry 1969, 141). But there are other interpretations, too. The view that the existence of several elites or leadership groups is compatible with democracy is called democratic elitism or democratic elite theory. A key principle of this theory is that elites cannot be defined a priori as compatible or incompatible with democracy, but this compatibility depends on the characteristics

of the elite (see Ruostetsaari 2007). Democratic elitism can be seen as a combination that reconciles classical elite theory (the hypothesis of the concentration of power among elites) and pluralism (the hypothesis of competition among elites). Democratic elitism is associated especially with Max Weber (1864–1920) and Joseph Schumpeter (1883–1946).

## Elites, Sub-elites, and the Public

Eva Etzioni-Halevy's demo-elite perspective is one of the most significant attempts to develop elite theory. Her description of the structures of power and influence makes a distinction between three echelons: elites, sub-elites, and the public. Elites are those people who occupy the highest echelons of power and influence structures. Next, the middle ranks of power structures are occupied by sub-elites. Finally, the lowest rank is occupied by the public, but even this stratum is not completely powerless. Like classes, each category within the elite structure can be further divided into sub-groups. Since the distribution of resources in society is a matter of degree some people have more and others have less resources, the elite structure or the distribution of power and influence is not a matter of either-or. As resources are not equally divided in any society, elite and power structures are best described in terms of gradations rather than as dichotomies (Etzioni-Halevy 1993, 29–30, 94–95, 1997, 1999).

The sub-elites have less power and influence than elites. In the political sphere, sub-elites include backbench or rank-and-file members of legislatures and leaders of sizeable, but not the largest, interest groups. In the economic sphere, sub-elites include the middle management of major corporations and the owners and top executives of smaller companies. Furthermore, they include the middle echelons of the bureaucracy, the military and the police, leaders of smaller social movements, holders of middle level or even junior judicial, media and academic positions, as well as officials or activists in labor unions and social movements. Those excluded from these strata constitute Etzioni-Halevy's third stratum, the public (Etzioni-Halevy 1993, 95–96).

According to Etzioni-Halevy (1993, 96), some sub-elites are second in command to elites in the same organizations. In these cases, the member sub-elites may represent elites before the rank and file, or vice versa, or both. Their position may be that of "the meat in the sandwich," "buffer zone," or "mediator," between the elite and members of the rank-and-file public. Hence, the autonomy of sub-elites from their own elites, those who stand at the helm of their organizations, may be no less significant than the autonomy from other elites. However, if the elites and sub-elites do not belong to the same organization, which is the normal situation, but represent more generally larger societal sectors, such as business and administration, it is doubtful whether, for instance, managers of big multinational firms can represent managers of small and medium-sized firms in relation to the government, or can mid-level civil servants represent junior civil servants in relation to the senior civil servants, that is the administrative elite.

However, there is no compelling reason to view the structures of elites and power as dichotomous or even trichotomous. The power structure of any society, or organization, can be described by the metaphor of a dartboard, in which the inner bullseye or the inner circle of power is surrounded by progressively weaker rings of influence. The radial sectors of the dartboard describe the sectors of society, which are divided between different strata of power and influence. Hence, the elites can be found in politics, public administration, business, civic associations, the mass media, science, culture, etc. Drawing the line where the "elite" ends and "the people" begins in each radial sector is an empirical question that has to be separately addressed in each research (Ruostetsaari 2015, 25).

## Vertical and Horizontal Mobility

Mobility, in the sense of reproduction, replacement, elite circulation, or convergence, has played a pivotal role in classical elite theories. The

replacement of one elite by another occurs in one of two ways: either through a gradual process of infiltration described by Mosca, or as Pareto had it, "the circulation of elites"; or through a violent revolution in which one group of elites is replaced by another. According to Pareto, the most obvious and most common obstacle to free elite circulation is the aristocratic principle: descendants of the elite are promoted to elite positions regardless of their abilities, at the same time as the most talented descendants of nonelite parents are excluded. Taken to an extreme, this process leads to elite inbreeding and ultimately to the degeneration of the elite. For this reason relatively unhindered elite circulation in the social hierarchy, both upward and down, is a condition for a healthy and strong society (Parry 1969, 39, 45–50, 60–63).

C. Wright Mills referred to horizontal circulation as a source of the coherence of the power elite. According to his theory, the degree of elite coherence is determined by the density of interplay between institutions. If institutions share several contacts and interests in common, the elites of those institutions will have a tendency to form a coherent group. "Institutional closeness" is highest when individuals move frequently from one leading position to another across institutions. By way of an example, Mills mentions top executives of major American corporations who have held important public offices, but who have returned to leading business roles or top positions in foundations. The ease with these kinds of roles are exchanged indicates the degree of group cohesiveness within the power elite, that is, the political directorate and occupants of leading positions in major corporations and the military: the more frequently roles are exchanged and the higher the degree of institutional closeness, the greater the cohesiveness of the power elite (Mills 1956, 10–11, 19, 287–288). In other words, a monolithic elite originates as a result of increasing interpenetration and overlapping between elite groups. If, on the other hand, mobility between the various elite groups is relatively weak, and if the separation generated by specialization and expertise is significant, then the pluralist interpretation of elite structure gains support (Dogan 2003, 5).

However, Mills's conception of the elite is not based exclusively on the interrelations between elite members in dominant institutions but also on their social and psychological similarity and their position in the highest social stratum. The coherence of the power elite can be understood against the origin, career, and lifestyles of elite members. The mutual connections among elite members lead to a common lifestyle and to a sense of unity. Self-consciousness, awareness of one's membership in the elite, furthers the cohesion of the power elite. Most elite members come from a similar social background: they have been recruited into the elite from the highest social stratum in society. Education is particularly important to the reproduction of the highest social stratum: exclusive education creates and reproduces the traditions of the highest social stratum and controls the access of new, affluent, and talented individuals into the elite (Mills 1956, 10–11, 63–66, 287–289).

## Elite Typology

The different elite theory perspectives can be combined in a way that integrates vertical and horizontal elite circulation into the same model. Classical elite theory maintains that different elite groups, such as the political, administrative, and business elite, are characterized by exclusivity, coherence, and unanimity (Meisel 1958), which can be cross-tabulated to develop a typology (c.f. Scott 1991, 119) (Fig. 1). The first variable in the typology is the degree of openness of the elite structure, which refers to vertical elite circulation. With respect to openness, recruitment into elites can vary from low (which means that elites have a much higher socioeconomic background than the citizenry) to high (which means that elites have a similar socioeconomic background to the general population). Members of the inner circle, that is the highest elite level, can be recruited from the lower elite levels or individuals who do not belong to elite circles at all.

The second variable of horizontal circulation refers to the degree of elite coherence, combining the variables of cohesion and unanimity. Elite

**Levels Within Elites, Fig. 1** Types of elite structures (Source: Ruostetsaari 2015, 29)

| | | DEGREE OF COHERENCE | |
|---|---|---|---|
| | | high | low |
| DEGREE OF OPENESS IN RECRUITMENT | low | Exclusive | Segmented |
| | high | Inclusive | Fragmented |

coherence is high if members of the elite and sub-elites have close interaction with one another, similar patterns of career mobility, and if they share similar opinions, attitudes, and values. The coherence of the elite structure is also reinforced by high mobility, in other words, frequent exchanges of roles between different elite groups and a sense of shared interests. Weak vertical links with the citizenry have the same reinforcing effect: this will protect the elite against any erosive effects caused by demands and control by the citizenry, which have the potential to create discord by pitting elite members against one another. According to Etzioni-Halevy (1993, 101), the autonomy of elites requires independence not only vis-à-vis other elite groups and the state but also the groups or classes they represent. Pakulski and Körösényi (2012, 24–25) argue that the political elite, for instance, needs authorization from the electorate – the trust and confidence of voters – but also considerable autonomy, insulation from the immediate pressures that come with mass authorization. Under such conditions of autonomy, politicians can accept public responsibility, the latter discharged to both parliaments and mass electorates.

The elite structure can be described as *exclusive* when elites come from a more privileged socioeconomic background than the citizenry and when they are recruited from society's highest strata, when they have very close mutual contact and they share similar values and attitudes. By contrast there is a wide gulf between the attitudes of elites and the citizenry. At the other end of the typology, a *fragmented* elite structure is characterized by a broad socioeconomic recruitment base, limited interplay between elites, and a wide gulf in attitudes. Elites might share certain societal rules of the game in common, for instance a consensus about the democratic process, but they differ in their views about many societal objectives. On the other hand, there are close links between citizen groups and elites, and they share similar attitudes (Ruostetsaari 2015, 29–31; see also Higley and Moore 1981, 2001; cf. Etzioni-Halevy 1993; Higley 2007).

In an exclusive elite structure, consensus among the various elite groups is so strong that we can talk about the existence of a single power elite. In a fragmented elite structure, by contrast, the consensus among elites is so weak that it is not justified to talk about a single power elite.

## Conclusion

Elite theorists argue that only democratic regimes are subject to regular, systematic elite competition and ascent (Schumpeter), mobility (Weber), and circulation (Pareto) (Pakulski and Körösényi 2012, 16). The importance of elite competition as a necessary condition for democracy has been stressed above all by democratic elitism (see Etzioni-Halevy 1993; Higley 2007; Engelstad 2010). According to the critics of democratic elitism, however, the classical criteria of democracy are not satisfied by the citizenry exercising its

control, primarily through elections, on the political elite only (Bachrach 1967). Competing elites may even be internally oligarchic when they are closed to citizen participation.

In fact, the degree of democracy in a society depends, firstly, on active vertical circulation, as pointed out by Pareto and Mosca, in other words, on the openness of elites. This means it must be possible for individuals coming from different socioeconomic backgrounds and lower elite levels to be recruited into elite positions. However, a very high degree of vertical circulation causes excessive turnover among elite members and therefore does not contribute to the functioning of democracy, because it may undermine both the stability of decision-making processes, the expertise of leaders and executives, and the attractiveness of leadership positions (Pakulski and Körösényi 2012, 153).

Secondly, the degree of democracy depends on slight horizontal elite circulation as stressed by Mills and democratic elitism, that is, on the separation of elites rather than on elite competition as such. John Higley et al. (1991) have suggested that integrated national elites are not enemies of democracy but on the contrary are a necessary condition for democracy. This argument is justified if a consensual relationship among various elites involves only formally and informally agreed rules and norms of policy-making. Consensus among elites must not be allowed to go so far that they are connected by close interaction and mobility and by agreement about the goals for the development of society. A closely integrated elite structure reduces elite competition and the responsiveness of elites toward the citizenry. For this reason elite autonomy, as stressed by Etzioni-Halevy (1993, 99–101), is an important condition for democracy. In the terms of the elite typology adopted here, an exclusive elite structure is inadequate, whereas a fragmented elite structure best meets the criteria of classical democracy. A fragmented elite structure can encourage individuals' mobility not only between different elite levels but also between various elites, such as elites of politics, business, and public administration.

# Life Cycles of Nonprofit Organizations

Mark A. Hager
School of Community Resources and Development, Arizona State University, Phoenix, AZ, USA

## Synonyms

Development cycle or stages; Life stages; Lifecycles

## Definition

Organizational life cycle refers to different stages of operations, spanning from concept and founding to decline and closure. "Cycle" implies that organizations in decline might be revitalized back to a growth phase. However, most conceptions simply recognize that organizations in different life stages have different liabilities, needs, behaviors, and potentials.

## Introduction

Most topics in this encyclopedia focus on public administration and policy as *government*. While government agencies and municipalities face any number of development issues as described in organizational studies, they are not typically a subject of the life cycles literatures. Rather, life cycles have been used to describe the development needs and life chances of private organizations. Life, product, and technology cycles are frequently invoked in business studies, but the notion of life cycles or stages is also common in the study or discussion of public-serving organizations, typically nonprofit organizations. This chapter discusses the life cycle notion generally but gives special attention to the life cycle idea as it has been applied to nonprofit organizations and social-entrepreneurial action.

## Life Cycle in Organizational Studies

"Life cycle" is a metaphor for helping us conceptualize various organizational processes. In his popular book *Images of Organizations*, Gareth Morgan (2006) suggests that we can gain deeper understanding and appreciation of organizations if we conceive of them in terms that are familiar to us. By comparing organizations to brains, or machines, or prisons, or organisms, we can communicate vital functions in images with which we or our audiences are already familiar. When we tell our mother that "she is the heart of our family," the organism analogy immediately communicates the sentiment that mother is vital to the family's function, although no one would confuse the family with an actual blood-pumping creature. It's a metaphor.

The use of such metaphors in organizational science is a minor controversy. Herbert Kaufman opened an influential essay more than 40 years ago with the observation that "[w]hen social scientists employ the language of biological evolution in their disciplines, biologists wince. The metaphors are usually more than strained" (1975, p. 131). The life metaphor that organizations are born, grow, and die akin to living creatures has been around for over 50 years, usually attributed to Chandler (1962). Since then, the metaphor has cropped up regularly. The greatest mileage in recent years seems to come in the work of consultants who have the job of translating difficult and sometimes boring topics into exciting and understandable workshops. Metaphors work better in practice workshops than in theoretical treatises. No one has run further with the nonprofit life cycle metaphor than Susan Kenney Stevens, whose 2002 book codifies her core message that

effective strategy must take into account the life stage and experience of the organization.

To be sure, academics have gotten less mileage out of the metaphor, at least as an explanatory theory. That is, while academics have routinely invoked the organism life cycle metaphor in one way or another, it is usually only to build an initial frame in familiar terms. No one goes so far as to suggest that obstetrics might help us guide foundings, that cancer research might help us fend off bankruptcies, or that technology advances in the conduct of autopsies might help us plumb the mysteries of the thousands of organizations that "die" each year. Consequently, the life cycle metaphor seems not to have moved much as a theoretical or conceptual device over the past half-century.

Life cycles in organizational science received a thorough treatment in 1980 with the publication of Kimberly and Miles' (1980) edited volume on the topic. Kimberly's attention to the controversy of the metaphor in his opening chapter is striking, especially his efforts to establish the life cycle idea as simple metaphor rather than serious theory. "Death is an inevitable feature of biological life. The same cannot be said for organizations. There is nothing about organizational life in itself that, of necessity, implies organizational death," he writes. "There is no inevitable linear sequence of stages in organizational life" (1980, p. 7). However, Kimberly then defends the multitude of chapters that follow that introduction as "constructive." The metaphor, he concludes, pushes us "to ask new questions about organizations... and it does force us to think deeply about the influence of context on organizational life" (1980, p. 13). This has been the promise and the fruits of the life cycle metaphor in decades since.

This is not to say that the concepts and literatures related to the life cycle metaphor have not flowed and changed over that time. Ideas gain and lose currency. For example, organizational population ecology introduced through the 1980s a series of influential ideas related to the "age" of organizations. As indicated below, the liability of newness argument has been the most substantial contribution to life cycle thinking. However, this title of "most substantial contribution" may be challenged by current attention to the conditions for creation of social enterprise. The relatively recent focus on social entrepreneurship has introduced both new concepts and new language regarding the founding and early needs of organizations. The result of these periodic forays is an intellectual stew spanning many decades, with different fields and scholarly traditions adding their voice to different stages of the life cycle metaphor.

As noted in the introduction, not all work related to the life cycle metaphor invoke the idea of a "cycle." Stevens' (2002) conception is circular, however, conceiving of organizations running from (1) idea to (2) start-up to (3) growth to (4) maturity to (5) decline to (6) turnaround which if successful can lead back to (3) growth but if unsuccessful will lead to (7) termination. Most others, however, engage the metaphor as a set of stages that may be important to understanding the current needs of organizations but do not stress the idea of a loop or cycle. The remainder of this chapter outlines prominent thinking on these various stages as has been considered variously by different scholarly traditions over the past half-century.

## From Nascence to Birth

Stevens describes the "idea" stage, or the remnants of the organization before it is established. Building on the recent emergence of a social entrepreneurship literature, Andersson (2016; Andersson et al. 2015) has championed a broader concept of "nascency," which refers to the range of environmental forces and seeds of innovation that serve as precursors for the development of new enterprises. Indeed, many of the questions asked by social entrepreneurship scholars inform the nascent stage, including the training and motivations of entrepreneurs, and the conditions for the establishment of new organizations.

The nascency concept is new, but it serves to tie key themes in social entrepreneurship to longer traditions related to organizational life cycles. While nascence is an important precursor stage, Andersson's discussion of nascency in the

nonprofit context raises questions about whether we should think of it as part of a cycle or stage model at all. First, he observes that nonprofits and social enterprises generally do not adhere to a particular pattern of emergence; they coalesce toward formal founding in myriad ways. Secondly, he notes that the length of nascency varies widely, with many never progressing beyond the idea stage (the idea just dies quietly). So, while some variety of nascence is a stage of the life cycle for all organizations, the variety of paths and vagary of results are inconsistent with a metaphor that suggests that organizational life unfolds in a circumscribed way.

This observation about the utility of the life cycle metaphor for understanding foundings also extends to research into the early formal stage of nonprofit organizations. To be sure, the formal organizations we can observe (as going concerns) have all graduated to that stage. However, research such as that by Carman and Nesbit (2013) emphasizes the variety of reasons why individuals create nonprofit organizations and point out that some are converted from business organizations or spun-off from government programs. The implication is that prevailing descriptions of both nascency and foundings bely simple proscribed models for how organizations unfold in their early stages. The implications of these recent characterizations on the life cycle model will unfold in coming decades.

## From Birth Through the Liability of Newness

A prominent theoretical argument through the 1980s regards the difficulties that young organizations have in establishing themselves. Indeed, "age dependence" on survival chances can be said to be one of several major early themes in the establishment of organizational population ecology and probably stands as the most theoretically and empirically rich development of research relevant to the life cycle model.

The conceptual underpinnings of the "liability of newness" is traced back to an out-of-the-way book chapter published by Arthur Stinchcombe in 1965. In that chapter, he describes and discusses why organizations might face difficulties in their early days. He observes that out of sheer experience older organizations have the luxury of easy reproduction of roles, skills, procedures, and other elements of culture, but new organizations must rely on conflicting cultures produced outside the organization. Stinchcombe suggests that inventing new roles and structuring relations for maximum performance have high costs in "time, worry, conflict, and temporary inefficiency" (1965, p. 148). Relatedly, he observes that old organizations rely on established internal relationships, while new organizations must rely on relationships among strangers. He extends this argument to external relationships as well, observing that the lack of established rapport with clients and vendors is part of a liability that can doom an organization until these elements of culture become established in the organization.

That book chapter gained sudden prominence in the late 1970s and 1980s as the go-to source for motivating research on the relationship between the youth of an organization and its life chances. This tradition did not tend to emphasize a life cycle metaphor in its explorations of age but instead employed a different biological metaphor: organizational populations as community ecology. Although the homages began with Stinchcombe, the theoretical explanations quickly moved from the single organization level to the community level. Just as populations of rabbits vary with changes in the populations of predator foxes, population changes in organizations were theorized as dependent on competition, resource availability, and the fit of organizations with environments. Young organizations were particularly seen as disadvantaged, and "age" enjoyed great prominence in sophisticated research published by Michael Hannan, John Freeman, Glenn Carroll, and an insular cadre of others. They explored the liability of newness in a variety of organizational populations, including newspapers, semiconductor firms, and unions.

While unions might be seen as a type of public-serving organization of interest to public administration and public policy, the age-dependent arguments were eventually tested by scholars

more centrally interested in the behaviors of nonprofit organizations. Singh et al. (1986) reported on a population of voluntary social service organizations and expressly invoked the life cycle arguments originally articulated by Stinchcombe, coupled with the popular idea that disruptions to organizational processes might "reset" the organization back to where it again suffers from the liability of newness. This theoretical offshoot squares solidly with the life cycle model. Singh and colleagues describe this cycle thusly: "...the liability of newness for a population of organizations may arise mainly from internal processes such as the coordination of new roles for participants and the development of trust among strangers. If this is the case, then reorganizations or organizational changes that are fundamental enough... will reduce the reliability of performance of the organization to that of a younger organization" (1986, p. 173).

What might reset the liability of newness clock? Singh and colleagues consider change in service area, change in chief executive, change in goals, change in client groups, and change in structure. Others later considered neo-institutional and social capital explanations for the liability of newness. However, in 2000, the population ecology camp had almost totally moved on from its early emphasis on age dependence, and the methodological and theoretical developments on this theme came to a halt. Age became a control variable in the new themes of this tradition (mostly focused on the relationship between the density of organizations in a field on their legitimacy and competition) rather than an area of focus. However, the combination of theoretical focus and methodological sophistication make that foray into understanding the liability of newness a key stage in the history of the life cycle model.

## From Newness to the Liability of Adolescence

More than a decade of attention on liabilities of newness for young organizations substantially increased our understanding of the conditions for growth of fledgling enterprises. Growth was seen as the fruit of overcoming the liability of newness, so long as organizations did not "reset" their progress by somehow compromising the core competencies on which their culture was based.

So, if the now-establishing organization stays the course, does that mean it is out of the woods and ready to thrive? Scholars in the 1990s investigated this question, introducing a twist on the liability of newness argument. Brüderl and Schüssler (1990) argued that many small organizations are artificially propped up by a stock of resources, goodwill, and no real expectation of success in the early going. Consequently, many are not under any real threat of failure during this "honeymoon period." The real test, they argued, comes when the honeymoon ends: resources thin and expectations rise. According to this formulation, adolescence can be an even more dangerous time for organizations, as they are pushed out of the nest. The liability of adolescence enjoyed some attention and empirical validation through the 1990s, although other research continued to validate the liability of newness thesis. In his own retrospective, Henderson (1999) suggests that whether the increased risk of failure comes at founding or a few years after founding is a relatively minor distinction. Whether at birth or adolescence, organizations have liabilities that they must overcome in order to grow into more productive stages.

## Battling Structural Inertia

Since Stinchcombe's description of the liability of newness points to problems stemming from the lack of routines, structures, and relationships in fledgling organizations, perhaps we should expect that organizations that overcome these liabilities are now primed for maximum production and impact. Certainly, survival and stability are important for organizations operating in their prime. However, the establishment of routines, structures, and relationships introduces a new problem:

structural inertia. "Inertia" here is another metaphor borrowed from the physical sciences: matter in its existing state tends to stay in that state unless influenced by an external force. Structural inertia refers to the rigidity that comes to organizations that have so successfully overcome the initial liabilities described by Stinchcombe, laying down strong structures, relationships, supply lines, and culture.

The structural inertia concept was introduced in Hannan and Freeman's seminal 1977 article that thrusted organizational population ecology temporarily to the heart of organization studies, but the concept did not get a full conceptual treatment until the authors returned to the topic a few years later (in Hannan and Freeman 1984). Key to the structural inertia argument is the relationship between organizational structures and their fit with the external environment. If external environments do not change, or change very slowly (what Hannan and Freeman called "coarse-grained" environmental change), then inert organizations that built their structures and relationships to conform to that environment might do very well and even thrive. The problem comes when environments change. Evolution has led freshwater fish to thrive in a freshwater pool, but freshwater fish perform poorly when oceans flood their pools or when their pools dry up entirely. The fishes' progeny (should any survive) may be able to adapt over time, but since adaptation is an evolutionary process rather than an instantaneous one, today's fish (those whose environments are compromised) are at risk of elimination. According to the structural inertia argument, resource investments, constraints on information exchange, internal political constraints, and a social resistance to reorganization conspire against attempts by managers to strategically adapt in a changing environment. In short, the very forces that help organizations overcome the liabilities of newness and adolescence might become challenges to organizations operating in fine-grained environments, where change is common and occasionally ground-shaking.

The dangers of structural inertia are a cautionary tale for organizations operating in the prime of their life cycle. Although the connection is not typically drawn, the conversation has shifted in recent years from the value of bureaucratic structure to the value of nimble innovation and the ability to react to external environments. Although an orientation to innovation and change is difficult to sustain in organizations as they grow and age, *innovation* is at the core of most current conceptions of social entrepreneurship and the development of organizations that have the best chance of having a real impact on social problems.

## Closure

Death of organizations is not inevitable; theoretically an organization can adapt and survive indefinitely. That said, organizations close regularly. Scholarship on the closure stage of organizations might be considered in two camps. For one, research occasionally focuses on closure processes in individual organizations. Sutton (1987) presents a "process model" of closure processes that is reminiscent of life cycle models, concluding that after organizations fail in efforts to avert demise, they announce the impending closure, disband, reconnect with colleagues, and undertake parting ceremonies. Duckles et al. (2005) also take the process model approach but focus on the forces that doom nonprofit organizations before they decide to close.

The second camp considers the characteristics of failing organizations compared to survivors. This approach considers many cases in statistical models rather than the small number of cases usually considered in process modeling. The greatest advances in the study of organizational closure came from the focus of the early wave of organizational ecology on failure. As discussed above, the liability of newness is the closure of organizations. The liability of structural inertia in a fine-grained environment is the

closure of organizations. Consequently, we know more about the determinants of closure of organizations than we do about foundings. Although research on organizational demise slowed through the 1990s as the population ecologists moved to other topics, individual scholars have returned to the topic periodically since then. The topic of which organizations live and which organizations die endures.

## Conclusion

The life cycle metaphor gives both practitioners and academics a familiar model for considering complex organizational processes. Although the conceptual model of organizations moving through actual stages of life has never held sway in academic treatments of the topic, scholars routinely consider different stages and the strategic implications for organizations operating in different phases of their life course. If the past is any indication, future scholarship will continue to wrestle with the ideas discussed in this chapter while bringing new ones to the Table. A recent article by Fisher et al. (2016) is a good example. The first line of the article invokes Stinchcombe and the liability of newness but then combines organizational identity concerns of the neo-institutionalists with environmental fit concerns of the ecologists, all in a quest to better understand how legitimacy plays out across the life cycle. More than 50 years of thinking on these topics provide us the basis for better understanding the lives and fates of the organizations we study and work in.

# Lifestyle in Large Cities in Russia

Alina Pishnyak and Natalia Khalina
Centre for Studies of Income and Living Standards, National Research University Higher School of Economics, Moscow, Russian Federation

## Synonyms

Differentiation of Russia's population; Everyday practices; Large cities in Russia; Leisure; Lifestyle; Megalopolis in Russia; Settlement differentiation in Russia; Standard of living

## Introduction

In the study of lifestyle, experts appeal to different aspects of life. By "lifestyle," some people understand only consumer practices, others focus their attention on civic and political activity, and others depict it through objective characteristics of employment, education, and welfare. Considering the existing approaches, here we present a description of the lifestyle in big cities of Russia, using data from various sources – from official statistics to sample household surveys to present a picture in detail. Special attention is paid to the cases of the two federal cities – Moscow and St. Petersburg, as the most striking examples of the formation of a special urban lifestyle in contemporary Russia.

## Changing Perceptions of Lifestyle in the Modern History of Russia

The study of lifestyle has become one of the priority directions of sociological research in post-reform Russia. Expansion of the range of consumer opportunities against the background of rapid income differentiation growth (which was especially true for large cities) has brought about significant changes in the standards of living of the population and their significant diversification. It became obvious that even at the level of rhetoric, the concept of the dual division of the lifestyle to the Soviet and capitalist one, widely spread in the era of the Soviet Union, has outlived its usefulness and needs a new classification. Over the past decades, many approaches have been proposed to identify different groups of population by type of consumption, social activity, cultural, and leisure preferences, etc. (A similar work was performed within the framework of sociological studies of companies involved in the collection of sociological data in Russia: GFK-Rus, Levada-Center, FOM, Ipsos, etc.).

Special attention was paid to studying the lifestyle determinants. Empirical studies have given reason to believe that income, if it is among the influencing lifestyle factors, is not the main one – the theory of the class conditionality of lifestyle (The idea of lifestyle determinism by belonging to a status group, not to a particular class, occurs in the works of M. Weber (2010)) again came under attack. On the contrary, the interpretation of lifestyle as the "realization of self-identity in reality" (definition by E. Giddens (1991)) once again confirmed its worth. It became obvious that the formation of one's own standards takes place in correlation with the standards of the social environment (and for citizens it is not only a close circle of friends, but also those who they have to deal with in their everyday practices of various kinds). Thus, lifestyle is not always income-driven, but the desire to maintain certain consumer standards (in the broadest sense of the term (It is about the consumption of goods and services in a wide range – from household to leisure, etc.)) can change claims to income.

Regardless of what is cause and what is consequence, the following is undeniable: the more there are income opportunities and more diverse consumer alternatives, the more active is the generation of new proposals, and the more intense is the process of change. Places of concentration of both consumer proposals (including innovation) and income opportunities in modern Russia are the major cities, especially Moscow and St. Petersburg.

## Socio-Economic Characteristics of the Lifestyle of the Major Cities of Russia

According to the statistics of 2016, Russia has 64 large cities (with population from 250 thousand to 1 million inhabitants) and 15 cities, which are home to respectively 19.1% and 22.5% of the total population of Russia (Population of the Russian Federation. . . 2016).

Russian cities differ significantly from each other in the context of socio-economic indicators and lifestyle of the population. The focus of this entry is to megalopolises; therefore, we will concentrate on the description of the situation in the largest cities of the country.

Federal cities are leaders of the postindustrial economy characterized by a high level of development: GDP per capita in Moscow is 47 thousand dollars at purchasing power parity, in Saint Petersburg – 22 thousand dollars, which is comparable with developed countries (Zubarevich 2012). However, according to experts of Deutsche Bank (Deutsche Bank https://www.db.com/russia/index_ru.htm), Moscow surpasses the quality of life in not only Beijing, New Delhi, and Sao Paulo but also in Singapore, known for its developed infrastructure and an emphasis on the latest technology (The ranking is based on eight subindexes compiled by crowd-sourced information database Numbeo, which create a broad picture of what it is like to live in different cities.).

### The Standard of Living, Income, and Employment

Rosstat data indicates significant differences in the major Russian cities from other types of settlements in terms of standard of living. For example, the national average of the deprived (According to the methodology used in the report UNDP (Human Development Report 2016. Human Development for Everyone. UNDP, NY).) is about 14% of the population and the socially excluded (According to the methodology used in the report UNDP (Regional Social Exclusion Report: Beyond transition, towards inclusive societies. UNDP 2011).) make approximately 7%, whereas in Moscow and St. Petersburg, the share of the deprived does not exceed 3–4%, and the excluded – 1% (According to the Comprehensive monitoring of living conditions of the population (2016), sample – 59,994 households, 134,852 individuals.). Average per capita incomes in Moscow are two times superior to the average level in Russia, in St. Petersburg – 1.4 times. Roughly, the same gap is seen in the ratio of the average wage of the working population. In the major cities, the unemployment rate (Rosstat data for December 2016.) and the share of workers employed without proper registration of labor relations with the employer are lower. The bulk of the unemployment in megalopolis areas is a short-term fluctuation and is associated primarily with the change of jobs. But residents of large cities work much more – a half of the Moscow inhabitants have a 40-h working week at their primary place of work and about a third work overtime. The qualification and professional structure of employment in large cities is also significantly different from the national one. In particular, the number of employees who take positions of specialists of higher qualification is dominant (and their share in the structure of employees is gradually increasing) and working occupations represent the narrowest sector.

### Education

Residents of large cities are more involved in educational processes. It is recorded at all levels of education: from early development and preschool classes to adult education. The city offers its residents a bigger number of educational opportunities: the offer is wider here, including the sector of paid services. However, a choice of free classes is also considerably wider – citizens can take the advantage of different houses of creativity, clubs, and leisure centers offering the training free of charge.

In general, the population in the Federal cities is the most educated: half of Moscow residents and 40% of the population of St. Petersburg aged over 15 years have a university degree (The data of Rosstat on level of education of those employed in the economy in 2016.).

However, the educational structure is different in families of different socio-demographic types: for example, the largest educational resource is

characteristic for working households, the smallest resource – for households of pensioners. Education of younger age cohorts are generally higher than the education of the citizens of the middle and older ages (According to the Comprehensive monitoring of living conditions of the population (2016), sample – 59,994 households, 134,852 individuals.). Perhaps, this causes the gap in the socio-economic situation of different groups of the population.

### Inequality

Of course, not all residents of big cities are characterized by high income and standard of living. It must be noted that in large cities, the indicators of socio-economic differentiation of the population are ahead of the average for Russia. For example, in Moscow, the wealthiest households (the fifth quintile per capita income) owns almost half of total household income and the average per capita income in this group is eight times higher than the income of low-income households (the first quintile by per capita income). Consumer spending of the rich is four times greater than spending of the poor. And if the cost structure of the first group is characterized by a low share of spending on food and a high share of payment for medical services, transport, communication services, and travel cost, the second basket consists mainly of products and the mandatory payments (The data of the sample survey of households of Moscow (2015), sample – 1500 households.).

It should be noted that the middle class in Russia is urban rooted and the majority of its members reside in large cities. Even though the middle class in Moscow has not become the most popular element of the stratification composition of the society and it is about 30% (According to the survey "Moscow and Muscovites" (2014), sample – 3000 respondents, the survey was conducted in GHANA "Institute of humanitarian development of metropolis." The share of the middle class is identified on the basis of the three-criteria approach – welfare, socio-professional status, and identity.), Russian cities are often characterized by a special consumer model.

### Consumption of Goods and Services, Finance, and Leisure

In the 2000s, Russia passed the period of domination of the living standard of the poor and embarked on the path of creating a new mass consumer model (Ovcharova et al. 2013), especially in large cities. Being a financial and economic center of Russia, Moscow provides the conditions for obtaining high wages, and infrastructure of the capital gives impetus to the development of various everyday practices.

In megalopolises, lifestyle is the most modernized (Zubarevich 2012). With regard to the purchase of goods, the most of the shopping here is done via modern retail formats (hypermarkets, supermarkets, discounters, etc.), which, that should be noted, are not presented in all types of settlements. In addition, residents of large cities often use the Internet for shopping online (if in Moscow, the consumer tends to buy clothes and shoes via the Internet, then in other major cities, the most actual purchase is a purchase of household appliances and electronics).

In large cities, a network of shopping centers, restaurants and clubs, sports complexes of a new format are rapidly developing. Besides, the traditional sector of cultural organizations (theatres, museums, cinemas) in the federal cities remains significantly wider than in other types of settlements. This capacity boosts demand for services, spins the flywheel of consumption.

In addition, for residents of large cities, financial services, particularly credit services, are more affordable. Although city residents have their own savings (including those held in banks) more often than other Russians, they also have loans with large volumes to be paid back.

In general, higher incomes and a more developed demand for market services contributed to a strong structural shift of the economy of the megacities in the direction of the service sector. It is reflected in the composition of GRP of major cities and is clearly recorded in the structure of household expenditure: the share of expenditure on different types of services in the budget of a resident of a large city is higher than the corresponding figure in the budget of other Russians.

Tourism and travel services, including foreign ones, are also more popular among residents of large cities. Leisure time for many people is not just free time, but the possibility of self-development; therefore, residents of large cities try to spend weekends or holidays away from home, getting new experience and impressions, including implementing their own hobbies and other passions. The more educated and wealthy residents of the capital go on vacation and visit foreign countries more often. More than 20% of them have repeatedly traveled abroad (the average for the sample of Moscow residents, 12%) in the last 12 months. We should mention the typical for residents of large Russian cities way of spending free time – going to the countryside where they can do gardening not for survival (as in the Russian provinces) but as a leisure activity.

Additionally, we note the significantly greater involvement of cities in the practices of healthy lifestyle and sport activities in particular (which is true for the more educated and younger citizens).

### Transport and Getting Around the City

The infrastructure of the city, the facilities it offers will definitely attract migration flows. Major cities grow, and, besides, the capital cities give an impetus to the development of satellite cities.

Because of their scale, cities have their transport characteristic features and it takes more time from city residents to get around. Megacities are characterized by significant spatial dispersion of the various activities of the citizens, places of residence, work, education, consumption of various services, etc. The most pressing issue is the imbalance between population settlement and places of employment that, on the one hand, increases the load on the transport system, and on the other hand, makes the time spent on moving around the city by transport an important factor in the organization of daily life of citizens. The median duration of travel from home to work for a Muscovite is 40 min, while one in four needs an hour or more to get to work.

Although the set of means of public transport in metropolitan areas corresponds to the world level, the problem of passenger traffic is quite acute. The Moscow metro transports more than eight million passengers every day, St. Petersburg – nearly three million. Besides, the major cities are leaders in the number of cars per 1000 population.

### Information Space

For residents of large cities, it is characteristic to be fully involved in the Internet space. In large cities, the Internet has become a part of everyday life not only for younger ages but also for the older age cohorts. More than two-thirds of the residents of federal cities use the Internet daily, while providers annually capture a doubling of traffic. In recent years, the growth is mainly due to the users of pension age.

However, the majority of inhabitants of large cities use the Internet for communication, gaming, and entertainment, and the TV remains the main source of information for citizens (over 80%). The proportion of those who get news from the Internet (about 40%) is also significant – they are younger and more educated citizens.

Nevertheless, even the television, radio, and press in metropolitan areas have their peculiarities: the choice of channels and publications are more diverse and, consequently, the picture is more complete, based on different points of view. Today, residents of large cities are increasingly turning to independent sources, demonstrating opposition views.

### Housing and Real Estate

Residents of large cities are in a more rigid housing for the meter housing, but they are located in more qualitative terms in the context of the equipment housing services. The cost per square meter in large cities of Russia is much higher than the national average. According to Rosstat, at the beginning of 2017, the average price of a square meter in Moscow is 2.8 times greater than the national average (http://www.gks.ru/dbscripts/cbsd/DBInet.cgi).

The subjective evaluations of housing conditions of residents of large cities are higher than in Russia on average. For example, in Moscow, only 6% of respondents believe that they live in

cramped conditions and 5% are not satisfied with the quality of their housing.

In large cities, the share of mortgage housing is significantly more than in other localities of Russia, and the segment of those who buy housing as an investment is also much wider. The rental housing market is more advanced – the leader here, of course, is the capital city.

### Demographics

However, the life of the city attracts people. Providing a wide range of jobs and consumer opportunities, cities attract population from geographic regions (for example, only half of the population of Moscow is represented by those who have lived in the capital since their birth), especially the young and active.

However, in general, by the age structure, cities are more "adult" than other types of settlement: in large Russian cities, the share of population of pension age reaches 1/4. This is partly due to the fact that the birth of children in large cities occurs at a later age than in other types of settlements, and, by the average number of births in Russia, female residents of large cities considerably concede to those women living in small towns and villages. For the representatives of urban youth, it is characteristic to have a longer period of training; they later acquire a stable job and later come into family units. All these factors together with relatively higher life expectancy determine the trend of an aging population in large cities.

### Health and Medicine

The availability of medical care for residents of large cities is higher than for other Russians. Medical infrastructure of urban areas is qualitatively different from those in other types of settlements. The level of outpatient care uptake among residents with health problems is higher than in Russia on average. As a result, residents of big cities is somewhat less than all Russians are treated in hospitals, and among the reasons for the refusal of medical treatment, they mention personal circumstances (lack of time and unwillingness to be treated) significantly more often than problems with the availability of services.

The official charge for medical treatment and stay in hospitals is much more common in federal cities than in other region. Among residents of metropolitan areas, involvement in programs of voluntary medical insurance is much more common than in average in Russia. This is a consequence of popularity of such programs among employers in the capital and greater development of health care providers working outside the program of obligatory medical insurance together with a higher paying capacity of patients. For example, the proportion of the adult population of Moscow (The survey of "Moscow and Muscovites" (2014), sample – 3000 respondents.) covered by voluntary health insurance is about 18% while the national average coverage is 4% (RLMS HSE NRU (2014), sample – 4872 households.).

Another important fact related to the health of the population is a higher prevalence in the habit of smoking cigarettes among residents of large cities. Moreover, it is noted in relation to both men and women. For example, in Russia on average, the proportion of smokers is about 30% (RLMS HSE NRU (2014), sampling – 4872 households.), and in Moscow – more than 40% of the population aged 18 years (The survey "Moscow and Muscovites" (2014), sample – 3000 respondents.).

Alcohol consumption in large cities is not much different from practices of consumption in Russia as a whole. However, we can say that even if the proportion of drinkers in cities is bigger than in rural areas, residents of large metropolitan areas drink alcohol less frequently and in smaller quantities in terms of the volume of pure ethanol. They often give preference to dry wines and champagne and drink less home-made brew, which is characteristic of alcohol consumption of rural residents.

It is also worth noting that the environment has a serious influence on the health of the residents of the federal centers, because large cities cannot boast of clean urban air. In the environmental component, they are inferior to medium and small cities. But this trend is observed worldwide, and it is confirmed by the data on the environment protection (Rosstat: Gks.ru).

### Stress and Social Tension

The rhythm of the city requires permanent involvement in current processes from the population, making a feeling of lack of available time acute, increasing the level of stress and social tension.

In general, the environment of the metropolis appears to be safe for 70% of Muscovites. However, 47% of respondents believe that it is impossible to feel safe, being late in the evening or at night in a residential area of the capital, and of 37.8% see certain risks in staying in the dark in the area of their residence. Educated, wealthy, and young residents of the metropolis assess the situation in a more positive way. Assessing the concerns of the population with different problems, it should be noted that the greatest concern among Muscovites has been crime and terrorism (share of those who "really care" about the problem – 66%), personal safety (57%), and access to medical services (59%). Their concern about the opportunity to get an education is significantly lower (33%).

Moreover, residents of large cities show civil activity. In cases of emergency, they are willing to organize and offer financial assistance to victims, be volunteers. However, residents of large cities demonstrate a greater willingness to protest actions, if what is happening affects them.

## Conclusion

The major cities of Russia are characterized by functional diversity; they have the multilateral potential, outstanding economic and geographic position. They usually have the progressive block that is a combination of science, higher education, engineering, advanced manufacturing, and also art and culture. Leading companies, institutions, and universities hold the leading position in their fields of activity. This combination creates an atmosphere of creativity, and it makes a big Russian city a notorious engine of progress. Due to the agglomeration effect (and also due to the effect of the capital rent in Moscow (Zubarevich 2017)), a Russian megalopolis generates the infrastructure benefits and provides greater opportunities to implement various consumer practices. Using the expanded range of opportunities, higher incomes, and quality goods and services, a major city promises a higher quality of life.

All of this draws significant migration flows to a large city, including the population with the greatest potential.

A modern inhabitant of a large city is characterized by high levels of education and skills, inclusion in various information flows, due to the constant access to the Internet.

Bearing in mind what is said on the consumption of education, health, and other services, it is necessary to admit that in Russia, the residents of large cities are investing far more in human capital than the rest of the citizens.

Nevertheless, the big city creates not only opportunities but also a number of limitations and barriers to the implementation of the needs and preferences of its inhabitants. For example, citizens do not have the time, money, and information in order to present a more active demand for cultural projects. Moreover, the rhythm of the city, the need to provide the accustomed level of consumption by maintaining a certain level of income, accessibility, and time needed to get to work or the necessary locations, and the perception of security increase the level of social stress, thereby imposing imprint on the lifestyle of modern residents of a big city in Russia.

# Lilly Ledbetter Fair Pay Act

Michelle L. Wade
West Chester University, West Chester, PA, USA

## Synonyms

Equal opportunity employment legislation; Equal pay complaints; Gender wage gap; Wage discrimination

## Definition

The Lilly Ledbetter Fair Pay Act of 2009 is a law that addresses the timeframe in which a person can sue for wage discrimination, stating that a discriminatory compensation decision or practice is a discrete act of discrimination each time it occurs, not just when the initial discriminatory compensation decision is made.

## Introduction

The Lilly Ledbetter Fair Pay Act of 2009 was the first piece of legislation signed into law by President Barack Obama. Although the name of the law sounds like it addresses equal pay, it actually only addresses the timeframe in which one can sue for wage discrimination. This legislation says that a discriminatory compensation decision is a discrete act of discrimination every time it happens, not just when the initial discriminatory compensation decision is made. Ultimately, it makes it somewhat easier for women to win wage discrimination claims. The primary impetus for the passage of the Lilly Ledbetter Fair Pay Act was the Supreme Court decision in *Ledbetter v. Goodyear* (2007). Lilly Ledbetter brought suit against Goodyear Tire Company when she discovered that she was making significantly less than her male colleagues. Although Ledbetter won her case at the district court level, Goodyear appealed the decision and won in an appellate court. The case eventually went before the Supreme Court of the United States (SCOTUS), and the Court decided in Goodyear's favor – arguing that Ledbetter had not filed her claim within the statute of limitations. Supreme Court Justice Ruth Bader Ginsberg did not agree with the majority in this decision and read her dissent from the bench – urging Congress to pass legislation that would prevent such an occurrence in the future. Opponents of the *Ledbetter* decision quickly mobilized to introduce new legislation that would become the Lilly Ledbetter Fair Pay Act. This entry analyzes the impetus for and the passage of the Lilly Ledbetter Fair Pay Act. The background of equal opportunity employment legislation and the circumstances that led Ledbetter to sue Goodyear are addressed first, followed by an examination of the *Ledbetter v. Goodyear* court case and the passage of the Lilly Ledbetter Fair Pay Act (LLFPA).

## Women and Employment Legislation

In 1919, Montana and Michigan passed equal pay laws – long before the United States (U.S.) Congress did. During World War I and II, equal pay became a national issue as a way to protect men's wages while they were at war. Equal pay was supported by women's rights advocates as well as groups like unions that were not concerned with women's rights, but with the maintenance of men's wages during the wars. If women made the same wage as men, then women would not be able to undercut men's salaries, and there would be little incentive to hire women if they had to be paid the same as men. The Departments of War, Navy, and Labor also supported equal pay for women during the war to protect men's wages. In 1945, equal pay legislation was proposed in

Congress, but it failed to pass. By 1963, 23 states had already passed equal pay laws. In 1963, Congress passed the Equal Pay Act, which "prohibits sex-based wage discrimination between men and women in the same establishment who perform jobs that require substantially equal skill, effort and responsibility under similar working conditions" (U.S. EEOC 1963). Despite this protection, wage discrimination still exists. In 2016, women made only 80.5 cents for every dollar that men made, not controlling for any other factors (IWPR 2018). Even when education, similar positions, and temporary leave are controlled for, women still make less than men though the gap narrows.

One of the greatest victories for women in employment law was Title VII of the Civil Rights Act of 1964. Title VII "prohibits discrimination on basis of race, color, religion, sex, and national origin in hiring, promotion, and termination decisions" (U.S. EEOC 1964). While the Equal Pay Act of 1963 addresses wage discrimination specifically, Title VII of the Civil Rights Act addresses discrimination more broadly. The implications of the Lilly Ledbetter Fair Pay Act extend beyond just women as the legislation benefits anyone filing a discrimination complaint under Title VII of the Civil Rights Act.

## Ledbetter's Complaint

In 1979, Lilly Ledbetter began working for Goodyear Tire Company in Gadsen, Alabama. Ledbetter was one of the first female managers in the plant and was employed as an Area Manager. Initially, Ledbetter was paid on par with the male managers in the plant. In 1981, Goodyear adopted a pay-for-performance appraisal system that was based on the performance of the managers. It was at this point that Ledbetter's compensation started to lag behind that of her male colleagues. Although Ledbetter suspected that she made less than the male managers in the plant, company policy dictated that salary information was confidential.

In 1998, Ledbetter received an anonymous note at work that contained salary information for herself and her male colleagues. At that time Ledbetter's salary was roughly $15,000 less than her highest paid male colleague and was still lower than the lowest paid male (*Ledbetter v. Goodyear Tire and Rubber Co., Inc.*, ([11th Cir. 2003]). A male colleague who also started around the same time as Ledbetter earned a base salary of $59,028 in 1998 while Ledbetter earned a base salary of $44,724 even though they made the same amount in 1979 (*Ledbetter v. Goodyear Tire and Rubber Co., Inc,* 421 F.3d 1169 [11th Cir. 2005]).

## Equal Employment Opportunity Commission (EEOC) Complaint

Ledbetter filed a complaint with the EEOC and brought claims of wage discrimination and a retaliation claim that violated Title VII of the Civil Right Act of 1964, the Equal Pay Act, and the Age Discrimination in Employment Act (ADEA). Ledbetter argued that she received less pay because of her sex and that she was transferred to another department in retaliation for sex discrimination complaints in the past or because of her sex or age (*Ledbetter v. Goodyear Tire and Rubber Co., Inc,* 421 F.3d 169 [11th Cir. 2005]). Title VII of the Civil Rights Act prohibits discrimination on the basis of sex, race, religion, color, and national origin while the ADEA prohibits discrimination against people over the age of 40 (Public Law 90-202 1967). The Equal Pay Act prohibits wage discrimination on the basis of sex. Claims under Title VII must be filed with the EEOC within 180 or 300 days of the discriminatory incident. The statute of limitations can vary by state. It depends on whether or not a state has an administrative office similar to the EEOC. In a deferral state that has such an office, complainants have up to 300 days to file with the state agency. In a non-deferral state like Alabama, the statute of limitations is 180 days (*Ledbetter v. Goodyear Tire and Rubber Co., Inc,* 421 F.3d 169 [11th Cir. 2005]). If an employee does not file a claim within the statute of limitations, then he/she cannot sue the employer at a later date.

## Northern District Court of Alabama

Ledbetter's case was heard in the US District Court for the Northern District of Alabama, Eastern Division. The only claims that proceeded to trial were the punitive transfer claim and the Title VII claim of disparate pay. At trial, Goodyear argued that Ledbetter's lower salary was a result of her performance, not sex discrimination. There was no record, however, of Ledbetter's performance reviews or those of her colleagues before 1992. Although performance reviews after 1992 indicate lower performance ratings overall, Ledbetter received a top performance award in 1995 (*Ledbetter v. Goodyear Tire and Rubber Co., Inc*). Ledbetter's Title VII claim for disparate pay relied on precedent that "an employee's pay was not time-barred so long as the plaintiff received within the limitations period at least one paycheck implementing the pay rate the employee challenged as unlawful" (*Ledbetter v. Goodyear Tire and Rubber Co., Inc.*, [11th Cir. 2003]). In 2003, a federal jury sided with Ledbetter on the disparate pay claim and awarded her $3.8 million dollars. This award was later reduced to $360,000 because punitive damages are limited according to the company's size under Title VII.

## 11th Circuit Court of Appeals

Goodyear successfully appealed the decision to the 11th Circuit Court of Appeals in 2005 and argued that Ledbetter's claim was time-barred because of the statute of limitations. According to the Appellate Court, only Ledbetter's most recent paychecks were eligible for a disparate pay claim because they were the only ones that occurred within the 180 day statute of limitations.

## Supreme Court of the United States

Ledbetter appealed the decision of the 11th Circuit Court, and the question before the Supreme Court centered on whether or not a plaintiff can sue for disparate pay if the *pay* itself was received during the statute of limitations period, but the *decision* to pay an individual less occurred outside of the statute of limitations period. Ledbetter argued that because she received at least one paycheck within the statute of limitations, her past pay could be considered for a disparate pay claim. SCOTUS disagreed. In a 5–4 decision, a majority supported by Justices Alito, Roberts, Scalia, Kennedy, and Thomas upheld the 11th Circuit's decision – finding that Ledbetter's claim for disparate pay fell outside of the statute of limitations.

In its 2007 decision, SCOTUS relied on precedent from *United Air Lines, Inc. v. Evans*, *Delaware State College v. Ricks*, *Lorance v. AT&T Technologies, Inc*, and *National Railroad Passenger Corporation v. Morgan* and concluded that a *wage compensation decision* was a "discrete act" that triggered the filing period with the EEOC, not necessarily the *pay* itself. This was a sticking point in the Ledbetter case because Goodyear had a salary review system, and Ledbetter did not file a complaint with the EEOC after performance reviews prior to 1998.

Justice Ginsberg – author of the dissenting opinion along with Justices Stevens, Souter, and Breyer – argued that precedent set in *Bazemore* suggests that unlawful discrimination occurs when a current salary has been affected by gender or race-based discrimination. Actual pay, not just the actual pay setting decisions, constitutes discrimination. After all, Ledbetter was unaware of discriminatory pay setting decisions until she received the anonymous note with salary information on it.

Ginsburg also used the *Morgan* decision to buttress her position, claiming it established unlawful employment practices that were discrete acts as well as acts recurring in nature. Ginsburg argued that Ledbetter's experience was more similar to a hostile work environment claim that was the culmination of multiple acts that built up over time rather than a discrete act. She then specifically called on Congress to fix the Court's narrow interpretation of Title VII of the Civil Rights Act of 1964.

## Mobilization

Almost immediately after the Supreme Court decision was announced, some members of Congress expressed intent to nullify the Court's decision. Representative George Miller (Democrat from California) sponsored the Lilly Ledbetter Fair Pay Act, and the House Committee on Education and Labor began hearing testimony in June 2007. Wade Henderson (President and CEO of the Leadership Conference on Civil Rights) testified on behalf of the Lilly Ledbetter Fair Pay Act. Later that summer, the House Subcommittee on Constitution, Civil Rights, and Civil Liberties held a hearing to determine the impact of the *Ledbetter* decision on the enforcement of civil rights laws. After the 2007 SCOTUS decision, Ledbetter gradually became a public figure with her testimony at Congressional hearings and public speaking engagements. She wrote an op-ed for the *Christian Science Monitor* in 2007, urging Congress to pass the bill then in committee.

## The Lilly Ledbetter Fair Pay Act

Although the Lilly Ledbetter Fair Pay Act was proposed in 2007, it lacked the necessary votes in the Senate. In the House, votes broke down primarily along party lines, with support from Democrats and opposition from Republicans. Although the bill did pass the House, it never came up for a vote in the Senate because it lacked the necessary votes for consideration.

Opponents of the Lilly Ledbetter Fair Pay Act included the Bush administration, most Congressional Republicans, the US Chamber of Commerce, the National Association of Manufacturers, and other business groups. The business community felt the legislation would be an additional administrative burden on businesses by requiring them to maintain employee files indefinitely.

Supporters of the Lilly Ledbetter Fair Pay Act included civil rights advocates, organized labor, most Congressional Democrats, and women's rights groups. After Obama became the presumptive presidential nominee, the National Women's Law Center invited Ledbetter to speak at the Democratic National Convention in 2008 on behalf of the Obama campaign. It was at that point when Ledbetter joined the Obama campaign and started stumping around the country for him.

After the 2008 election of Obama, the bill was re-introduced as H.R. 11 in the 111th Congress. On January 22, 2009, H.R. 11 passed 247-111 in the House, and the Senate version, S. 181, passed 61-36 in the Senate (*Cong. Rec.* 2009, 155, 13: 22). The number of Democrats in the Senate had increased from 49 to 56 after the election, allowing the bill to be brought to the floor for a vote early in 2009. The change in membership and the perceived mandate from Obama's election victory gave the Democrats enough votes to end a potential Republican filibuster. In the end, there was some bi-partisan support with five Republicans in the Senate voting in favor of the legislation. Every female member of the Senate (regardless of party) voted in support of the law. Results in the House were less bi-partisan with only three Republicans voting for the bill (Govtrack 2009).

The Lilly Ledbetter Fair Pay Act explicitly overturned the Supreme Court's decision in *Ledbetter* and says that a discriminatory compensation decision is a discrete act of discrimination every time a person is paid, not just when the initial discriminatory compensation decision is made. The LLFPA amended Title VII of the Civil Rights Act of 1964 and the Age Discrimination Employment Act of 1967. It also modified the Americans with Disabilities Act of 1990 and the Rehabilitation Act of 1973. In Section 4, the law specifies that it does not affect pensions, which was a central concern for businesses that opposed the law (Public Law 111-2, 2009). Businesses do not have to increase pension payments if evidence of wage discrimination is found. The EEOC maintains responsibility for enforcement of the law.

There are several implications of the Lilly Ledbetter Fair Act for practitioners and managers in human resource management. Documentation of salary decisions and performance reviews are important for any manager and not just to prevent

lawsuits. It is important for practicing managers to promote equity in compensation decisions for the sake of justice and fairness.

## Conclusion

The Supreme Court decision in *Ledbetter v. Goodyear* was a direct catalyst for the passage of the Lilly Ledbetter Fair Pay Act, and the results of the November 2008 election facilitated the passage of the bill. While the Lilly Ledbetter Fair Pay Act does provide additional protections for workers, it does not actually provide for equal pay. Treating each disparate pay check as a discrete act of discrimination does not benefit an employee who is unaware of such wage discrimination in the first place. Since the law only addresses the timeliness of complaints, it is unlikely to solve the underlying problem of sex discrimination in salary decisions. Furthermore, salary information is still confidential in most organizations. Some organizations even specifically prohibit discussions of salary. Until there is salary transparency in organizations, disparate pay will continue to be a problem.

# Linear Regression

Kamal Kasmaoui
ESC Pau Business School, Pau, France

L

## Synonyms

Cross-sectional regression; Linearization; Pooling linear regression; Time series regression

The main objective of regression analysis is to develop an equation showing how the variables are linked. The predicted variable is called the dependent variable and is noted by $y$.

The variables used to forecast the value of the dependent variable are referred to as the independent variables and are designated by $x$.

Regression is likely the most important tool at the disposal of the econometrician.

## Definition of Linear Regression Analysis

Linear regression is used to explore the extent to which a variable or set of variables may predict a dependent variable. In addition, linear regression also provides results in terms of the significance of the predictor variables as well as the magnitude (estimated coefficient value)

and sign of relationship (negative or positive estimated coefficient sign).

Linear regression involves describing and assessing the relationship between a given variable (generally referred to as a dependent variable) and one or more other variables (generally referred to as independent variables).

Generally the dependent variable is indicated by $y$ and the independent variable(s) by $x_1, x_2 \ldots x_p$ where there are p independent variables.

## Distinction Between Regression and Correlation

If we say that y and x are correlated, it implies that we consider y and x in a completely symmetrical way.

However, in regression, we treat the dependent variable (y) and the independent variable(s) (x) differently. It is assumed that the variable y is random or "stochastic" in a certain way, i.e., it has a probability distribution. However, it is assumed that the x variables have fixed ("non-stochastic") values in the repeated samples.

Simple linear regression requires both an independent and a dependent variable. Furthermore, the relationship between the two variables is represented by a linear line. Whereas, regression analysis using two or more independent variables is known as multiple regression.

The regression model is represented by an equation describing how y is related to x and an error term.

Regression is used to study the relationship between two or more variables. It should be noted that there are several types of regressions. First, a distinction is made between parametric and nonparametric regression. In parametric regression, it is assumed that the form of the relationship between the variables is known, so the estimation function is known a priori. In contrast, nonparametric regression presumes that the estimation function is not predetermined.

We also recall here that in parametric regression we distinguish between two types of regression: linear regression and nonlinear regression.

In this chapter, we are interested in linear regression.

## Some Elementary Definitions

### Dependent Variable

The dependent variable is the variable that is affected by the independent variable.

Dependent variables are measures that, by hypothesis, are likely to depend on the change in modality of one or more independent variables. The measurement of the dependent variable allows, by comparing the results of the different experimental groups (or experimental modalities), to test the effect of the influence of the independent variable.

### Quantitative Variable

Quantitative variables therefore measure "quantities." There are two types of quantitative variables can be distinguished: The first type is the variable that can take any value in a given range. We use the continuous term to describe this type of variable. A continuous variable can theoretically take an infinite number of values, forming a continuous set, such as the time required to complete a task, the height, weight of a person, etc.

The second type of quantitative variable is the one that takes values such as the number of workers in an industrial establishment. This type of quantitative variable is known as a discontinuous variable, for example, the number of items in a list and the number of people in a room.

### Qualitative Variable

The qualitative variable divides a population into categories. It often comes in the forms of binary information, for example, decision to buy or not to buy a product, obtain a diploma, a person does or does not own personal

computer, the local collectivity has or does not have a financial rating, etc.

### Data

***Continuous*** data can be any value and is not restricted to specific numbers, for example, sales in euros or size centimeter.

***Discrete*** data is usually integers, so it cannot take all the values, for example, the number of people working in a company and the number of students on the universities.

Econometrics enables economists to either validate a theory or to use it as an investigative tool.

Econometrics is a tool that allows economists to refute or confirm established theories.

The economist assumes relationships; the implementation of econometric methods yields estimates of the value of the coefficients as well as the expected precision. The estimation of coefficients is based on data collected by the author or by certain international organizations such as World Bank, IMF, etc. After estimating the model, we check whether the model is adequate or not. If so, we interpret the results. If not, we reformulate another model that would be more appropriate.

Source: Chris Brooks (2008)

## The Simple Regression Model

We present the most basic model: an endogenous variable is explained by an exogenous variable. The model reflects a simplification or caricature of reality. Example of a model:

$$y = \alpha_0 + \alpha_1 x + \varepsilon \quad (1)$$

where $y$ = wage, $x$ = education, $\alpha_0$ and $\alpha_1$ are the model parameters or regression coefficients, and $\varepsilon$ is a random variable called the error term.

The simple linear regression equation is $E(y) = \alpha_0 + \alpha_1 x$:

$\alpha_0$ is the $y$ intercept of the regression line.

$\alpha_1$ is the slope of the regression line.

$E(y)$ is the expected value of $y$ for a given $x$ value.

∗ Positive linear relationship can be illustrated by the following figure:

Source: Anderson et al. (2010)
∗ Negative linear relationship

Source: Anderson et al. (2010)
∗ No relationship

Source: Anderson et al. (2010) The estimated simple linear regression equation is written:

$$\widehat{y} = \alpha_0 + \alpha_1 x$$

$\widehat{y}$ is the estimated value of y for a given x value.

## Estimation Process

Source: Anderson et al. (2010)

## Specification

It is interesting to recall that there are three types of data that econometricians could use for the analysis:

Time series models, variables represent phenomena observed at regular time intervals, such as consumption and annual income over 30 years for a given country. The model is written:

$$y_t = \alpha_0 + \alpha_1 x_t + \varepsilon_t, \text{t} = 1, \ldots, 30 \quad (2)$$

The cross-sectional models, the variables represent phenomena observed at the same time but concerning several individuals, for example, consumption and income observed on a sample of 30 countries.

The model is then written:

$$y_i = \alpha_0 + \alpha_1 x_i + \varepsilon_i, \text{i} = 1, \ldots, 30 \quad (3)$$

Panel data models, in which data are represented in a double dimension: individual and temporal, they have both time series and cross-sectional dimensions. Generally each observation is reported by t and the total number of observations by T for time series, while each observation is reported by i and the total number of observations by N for cross-sectional data.

For example, consumption and income observed on a sample of 30 countries over a 30 year period. The model is written:

$$y_{it} = \alpha_{0i} + \alpha_{1i} x_{it} + \varepsilon_{it}, \quad \text{t} = 1, \ldots, 30 \text{ and i} = 1, \ldots, 30 \quad (4)$$

## The Multiple Regression Model

The multiple regression model is an extension of the simple regression model. For the latter, we have already considered that an endogenous variable is explained using a single exogenous variable. Nevertheless, it is extremely rare for an

economic or social phenomenon to be captured by a single variable. The multiple linear model is a generalization of the simple regression model in which several explanatory variables are included:

$$y_t = \alpha_0 + \alpha_1 x_{1t} + \alpha_2 x_{2t} + \ldots + \alpha_p x_{pt} + \varepsilon_t \quad (5)$$

$y_t = variable\ to\ be\ explained.$
$x_{1t} = explanatory\ variable\ 1.$
$x_{2t} = explanatory\ variable\ 2.$
$\ldots$

$$x_{pt} = explanatory\ variable\ p.$$

$$\alpha_0,\ \alpha_1 \ldots,\ \alpha_p = \text{model parameters.}$$

$\varepsilon_t$ = specification error (difference between the true model and the specified model), this error is unknown and will remain unknown.

$$n = \text{number of observations.}$$

## Parameter Estimation

It is interesting to note that there are several estimation techniques, but the one most used is the ordinary least square (OLS) regression.

## Least Squares Criterion

In order to estimate the coefficients or parameters of the model, we apply the ordinary least squares method, which consists in minimizing the sum of the squares of the errors ($\varepsilon^2$), i.e.,

$$Min \sum_{t=1}^{n} \varepsilon_t^2 = Min\ \varepsilon'\varepsilon = Min \sum (y_i - \widehat{y}_i)^2$$
$$= Min\ (y - \alpha x)'(y - \alpha x)$$

where:

$y_i$: represents the observed value of the dependent variable for the ith observation.

$\widehat{y}_i$ : is the estimated value of the dependent variable for the ith observation.

Estimation of the parameter $\alpha_1$:

$$\alpha_1 = \frac{\sum (x_i - \overline{x})(y_i - \overline{y})}{\sum (x_i - \overline{x})^2}$$

where:

$x_i$ = the independent variable for $i$th observation
$y_i$ = the dependent variable for $i$th observation
$\overline{x}$ = the mean for independent variable
$\overline{y}$ = the mean value for dependent variable
The constant for the estimated model is:

$$a_0 = \overline{y} - a_1 \overline{x}$$

Example (Anderson et al. 2010): Reed auto sales

As part of the advertising campaign, Reed auto broadcasts one or more television advertisements during the week preceding the sale, knowing that Reed auto regularly organizes a special 1-week sale. Data from a sample of five previous sales are shown on the table:

| Number of TV ads (x) | Number of car sold (y) |
|---|---|
| 1 | 14 |
| 3 | 24 |
| 2 | 18 |
| 1 | 17 |
| 3 | 27 |

We have an intuition that the correlation between number of TV ads (x) and number of car sold (y) is positive, so we want to know if there is a relationship between x and y given the data we have. The first step is to form a scatter diagram of the two variables.

∗ **scatter diagram**

Source: author's calculation

## Line of Best Fit

The general equation for a straight line is written as:

$$y = \alpha_0 + \alpha_1 x$$

to obtain the most appropriate line for the data. Nevertheless, this equation ($y = a + b\ x$) is absolutely deterministic. Because this is not realistic, we need to add a random disturbance term, ε in the equation.

$$y = \alpha_0 + \alpha_1 x + \varepsilon$$

The term disturbance can encompass a number of characteristics:

- We always neglect certain determinants of y.
- There may exist errors in the measurement of y that cannot be modelled.
- Random external influences on y that we cannot model.

## The Assumptions of Classical Linear Model

For model estimation, the following assumptions are required to be completed concerning the $\varepsilon_t$ (unobservable error terms):

1. $E(\varepsilon_t) = 0$, the errors terms have zero mean.
2. $Var\ (\varepsilon_t) = \sigma^2$, the errors have constant variance.
3. $Cov(\varepsilon_i, \varepsilon_j) = 0$, the statistical errors are independent of each other.
4. $Cov(\varepsilon_t, x_t) = 0$, no relationship between the error and the independent variables $x_t$.

## Determining the Regression Coefficients

How to determine $\alpha_0$ and $\alpha_1$?

We choose a and b so that the distances (vertical) between the data points and the fitted lines are reduced to a minimum (so that the line fits as closely as possible to the data):

L

Source: author's calculation

| Number of TV ads (x) | Number of car sold (y) |
|---|---|
| 1 | 14 |
| 3 | 24 |
| 2 | 18 |
| 1 | 17 |
| 3 | 27 |
| $\sum x = 10$ | $\sum y = 100$ |
| $\bar{x} = 2$ | $\bar{y} = 20$ |

## Slope for the Estimated Regression Equation

$$\alpha_1 = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{\sum (x_i - \bar{x})^2} = \frac{20}{4} = 5$$

The constant for the estimated regression equation

$$a_0 = \bar{y} - a_1 \bar{x} = 20 - 5(2) = 10$$

## Estimated Regression Equation

$$\hat{y} = 10 + 5x$$

Coefficient of determination is a major result of the regression analysis. It is considered as the proportion of the variance of the dependent variable that is predictable from the independent variable. It is formulated as follows:

$r^2$ = Sum of Squares due to Regression / Total Sum of Squares

Total Sum of Squares = Sum of Squares due to Regression + Sum of Squares due to Error

$$\sum (y_i - \bar{y})^2 = \sum (\hat{y}_i - \bar{y})^2 + \sum (y_i - \hat{y}_i)^2$$

$r^2$ = Sum of Squares due to Regression / Total Sum of Squares = 100/114= 0.8872

87.72% of the variation in the number of cars sold is explained by the variation in the number of television ads. This indicates that the regression relationship is very strong.

## Linearization of Nonlinear Models

In many cases, economic theory must be formalized using nonlinear relationships.

We will examine the case of models whose specification is not linear but which are linear with respect to their parameters.

### Exponential Type Functions

Estimation of a Cobb-Douglas production function

$$Y = A\,K^{\alpha}L^{\beta}$$

$$A = \text{is technology}$$

$$K = \text{capital}$$

$$L = \text{labor}$$

In order to estimate this nonlinear (exponential) model, we use the logarithmic function to linearize the model:

$$Log(Y) = Log(A) + \alpha\, Log\,(K) + \beta\, Log(L) + \varepsilon$$

The parameters α and β can be interpreted as follows: the percentage changes in K and L that influence the percentage change in Y. Parameters α and β are the elasticity of production with respect to capital and labor $\left(\text{elasticity} = \frac{\frac{\Delta y}{y}}{\frac{\Delta x}{x}}\right)$.

### Example

This example is based on Bourbonnais (2009) using our own data.

Production data for 20 companies

| Y | K | L |
|---|---|---|
| 42,88738 | 2 | 10 |
| 57,129884 | 3 | 12 |
| 65,179127 | 4 | 11 |
| 69,672271 | 5 | 13 |
| 85,460921 | 6 | 14 |
| 74,634667 | 5 | 13 |
| 91,223408 | 6 | 15 |
| 82,948763 | 5 | 15 |
| 50,954002 | 2 | 12 |
| 108,44007 | 9 | 15 |
| 86,153364 | 6 | 14 |
| 67,027474 | 4 | 12 |
| 76,490267 | 5 | 14 |
| 58,716509 | 3 | 13 |
| 50,627514 | 2 | 12 |
| 83,641509 | 5 | 17 |
| 57,06262 | 4 | 10 |
| 83,970232 | 8 | 11 |
| 97,31201 | 7 | 16 |
| 72,914346 | 5 | 12 |

I remind you that we have the following relationship to estimate: $Y = A\,K^{\alpha}\,L^{\beta}$

Estimation of coefficients

In order to estimate this nonlinear model, we proceed to a logarithmic transformation, to linearize it:

$$Log(Y) = Log(A) + \beta_1\, Log\,(K) + \beta_2\, Log(L) + \varepsilon LY = \beta_0 + \beta_1\, LK + \beta_2\, LL + \varepsilon$$

where LY, LK, and LL are the variables Y, K, and L transformed by the logarithmic function.

LY = Log (Y)

LK = Log (K)

LL = Log (L)

Data transformed into logarithms:

| LOG(Y) | LOG(K) | LOG(L) |
|---|---|---|
| 1,6323295 | 0,30103 | 1 |
| 1,7568633 | 0,4771213 | 1,0791812 |
| 1,8141085 | 0,60206 | 1,0413927 |
| 1,84306 | 0,69897 | 1,1139434 |
| 1,9317676 | 0,7781513 | 1,146128 |
| 1,8729406 | 0,69897 | 1,1139434 |
| 1,9601063 | 0,7781513 | 1,1760913 |
| 1,9188099 | 0,69897 | 1,1760913 |
| 1,7071783 | 0,30103 | 1,0791812 |

| LOG(Y) | LOG(K) | LOG(L) |
|---|---|---|
| 2,0351898 | 0,9542425 | 1,1760913 |
| 1,9352722 | 0,7781513 | 1,146128 |
| 1,8262529 | 0,60206 | 1,0791812 |
| 1,8836062 | 0,69897 | 1,146128 |
| 1,7687602 | 0,4771213 | 1,1139434 |
| 1,7043866 | 0,30103 | 1,0791812 |
| 1,9224219 | 0,69897 | 1,2304489 |
| 1,7563517 | 0,60206 | 1 |
| 1,9241254 | 0,90309 | 1,0413927 |
| 1,9881664 | 0,845098 | 1,20412 |
| 1,862813 | 0,69897 | 1,0791812 |

## Estimation Results

The first column present the parameters (the intercept and the values of $\widehat{\beta}_0$ and $\widehat{\beta}_1$ ).

In the second column, we find the standard errors for each parameter.

The third column shows the value of T test.

The fourth column displays the p-value (probability value) which shows whether the variable is significant or not.

The coefficients associated with the variables KL and LL are significant. Because the p-value associated with these two explanatory variables are lower than 5% (for more details, see Makhlouf 2017), so the capital and labor have a significant impact on production. But, what is the size of the impact of each of the variables?

For this, we will see the value of the two estimated coefficients $\beta_1$ and $\beta_2$ for the following equation:

$$LY = \widehat{\beta}_0 + \widehat{\beta}_1\, LK + \widehat{\beta}_2\, LL$$

On the basis of the results of Table 1, the estimated model is written as follows:

$$LY = \widehat{\beta}_0 + \widehat{\beta}_1\, LK + \widehat{\beta}_2\, LL$$
$$LY = 0.95 + 0.42\, LK + 0.56\, LL$$

The elasticity of production to capital is equal to 0.42.

The elasticity of production to labor is equal to 0.56.

The values of the estimated parameters $\widehat{\beta}_1$ and$\widehat{\beta}_2$ can be interpreted as follows: if the capital factor increases by 1%, production increases by 0.42%, and if the labor factor increases by 1%, production increases by 0.56%.

Therefore, the estimated nonlinear equation $\widehat{Y} = A\, K^{\alpha}\, L^{\beta}$ can be written as follows:

knowing that $\widehat{\beta}_0 = Log\,(A) = 0.95$, so $A = e^{0.95} = 2.58$, and $\widehat{Y} = 2.58\, K^{0.42}\, L^{0.56}$.

# Link Between Administration, Politics, and Bureaucracy

Israel Nyaburi Nyadera[1,2] and Md Nazmul Islam[2]
[1]University Of Macau, Macau, China
[2]Ankara Yildirim Beyazit University, Ankara, Turkey

## Synonyms

Administration; Bureaucracy; Governance; Politics; Politics and bureaucracy nexus; Public administration

## Definition

*Relationship between administration, politics, and bureaucracy*: To examine how relations between public servants and political elites influence performance and affect administration in general. This is done by examining the nature and processes through which administrative structures and features are shaped within developed and developing countries. It examines how political players use their positions and instruments of power for personal gains or attempt to fulfil promises they made to their electoral base by influencing bureaucrats involved in policymaking and implementation. More often reforms have entailed making changes in the administrative structure of a particular country so as to overcome challenges and promote efficiency. However, an unhealthy interaction between politicians and bureaucrats has lots of negative consequences on public service delivery.

## Introduction

Structured system of managing public affairs has historical origins and remains significantly relevant to human societies. However, it gains prominences among industrialized countries which sought to establish hierarchical bureaucracy consisting of professionals to collaborate with political leadership in delivering quality public goods. This involved establishing and restructuring of administrative agencies, civil service, and public budgets in order to promote citizens' welfare and security and fulfil their demands (Kettle and Fesler 1991). Waldo (1948), Redford (1969), Marx (1957), Rohr (1986), and others were among the first scholars to develop the philosophical and theoretical tools of examining key aspects of administration, governance, bureaucracy, and public management. Nevertheless, significant changes experienced at the domestic and international levels have compelled scholars and practitioners to rethink the different dimensions in theoretical and practical application of public administration. More often, reforms have entailed making changes in the administrative structure of a particular country so as to overcome challenges and promote efficiency. New approaches like the introduction of ideas such as good governance, new public management, and public private partnership, among others have been introduced with mixed results in various countries. On the other hand, interaction between politics and bureaucracy in administrative systems has shown unique trends among developing and developed societies and has sometimes had devastating results.

The nexus between politics and bureaucracy as well as administration and bureaucracy has thus attracted several academic scholarships over a

number of years. Majority of these studies have sought to highlight ways in which scholars and practitioners can complement each other. Scholars have also sought to investigate the general relationship between politics and administration in the category of developed, developing, and least developed countries. Studies in political-administrative relationship among developed and developing countries have highlighted new developments especially on how and why administration, bureaucracy, and politics are core themes in the discussion part of public administration. Systematic comparative studies of bureaucracy, administration, and politics has evolved since the late 1808s. This is the time former American President Woodrow Wilson had sought to establish a boundary between political and administrative spheres (Rosenbloom 2008; Sager and Rosser 2009; Peters 2010; Overeem 2012). In his extended works, Wilson sought to classify the roles and responsibility of politicians and administrators especially in the process of policy formulation and implementation formulations and policy processes which ultimately subjected this discipline to further inquiries in academia (Demir and Nyhan 2008; Georgiou 2014).

This study, therefore, seeks to examine the relations between politics and bureaucracy and the resulting impact of administration in general. It aims to highlight how relations between bureaucrats and politicians might influence policymakers in developed and developing countries to formulate and implement the policies in any sphere of administration. It identifies that politicians and bureaucrats in a country may have similar goals of providing public services but may differ on the process and criteria of implementing these goals. This is attributed to the diverging interests especially to the audience they seek to impress.

## Nexus between Administration, Politics, and Bureaucracy

In theory, frequently defined roles and responsibilities of political executives and bureaucrats suggest that there should not be any tension between the two sets of authority. The former is supposed to formulate policies and the latter is tasked with implementing them. However, in reality, substantial tensions exist as a result of conflict of interest and overlapping roles. Power distribution and power distance between politicians and bureaucrats has over the years been identified as one of the key measures of determining the level of independence and autonomy public servants have from political elites. Similarly, policymaking, and its implementation, is often hazy and blurred. For centuries, the question of "who governs whom" has remained salient among many studies, most of which have fallen short of providing a substantial answer. In the earlier times, bureaucrats serving in kingdoms, monarchies, or empires obtained their privileges by being loyal to the king or whoever governed. This means that there was an obvious thin line between the King and the bureaucrats; thus the administrative system was highly shaped by the ruler's discretion. In contemporary democracies, politicians derive their mandate and legitimacy to govern from the citizens either directly or indirectly while bureaucrats are guided by existing laws and legislations governing performance of public servants. This change has had an important impact on the manner in which politicians and bureaucrats relate. It has created fierce rivalry between democratically elected executives and government appointed or nominated officers.

Despite clear tensions, the place and importance of bureaucrats cannot be undermined. Existing literature suggest that although the contributions of bureaucrats may be dramatic and sometimes neglected, they nevertheless play a crucial role of information-providing, interact closely with political decision makers, and offer advice to executives. The ability of bureaucrats to control the nature and amount of information policy makers receive makes bureaucrats enjoy significant leverage and influence on the policy outcome. Noteworthy, in the contemporary setting, this form of approach is likely to be more applicable in developed democracies and less important in existing populist and authoritarian regimes.

Similarly, the interface and interaction between administration and politics is always dependent on country's political culture and on political and administrative system (Onder and Nyadera 2019). Anglo-American administrative system tries to maintain a distinct line separating administration and politics. On the other hand, European countries, such as Germany, emphasize more on principles, rules, and procedure in the public sector management. Scandinavian and Nordic countries have adopted a more rational administrative system when it comes to policy formulations and agenda settings. Their administrative system is characterized by interconnecting administration and politics to achieve policy solutions. However, South Asia, particularly India, Pakistan, and Bangladesh, as well as most African countries are often intertwined and depending on the circumstances the executive wields more power and authority over the bureaucracy and will in many cases influence bureaucratic processes and decisions.

Max Weber in his early and mainstream writings begun to examine the relationship, similarities, and differences between administration, politics, and bureaucracy. This trend has continued to evolve and become more embedded in the study of public administration as scholars sought to establish the "scientific management school" (Gerth and Mills 1946). Some of the fundamental concerns for scholars included but not limited to questions of bureaucrats having undue influence on policy or state agents politicizing the bureaucracy. Even though the bureaucracy is at times considered to be overshadowed by the executive, Goodnow (1900, p. 5) opines that "[t]he administrative system has, however, as great influence in giving its tone to the general governmental system as has the form of government set forth in the constitution." Both Weber and Wilson provide a distinct argument on the relations between administration and politics. Weber highlighted that the very "ideal types" of administration should be based on different dimensions such as logic or rationality (Gerth and Mills 1946). On the other hand, Wilson is a strong proponent of administrative systems with less political interference and hilly efficient. For Wilson, if bureaucrats were unchecked could result into "an offensive official class, – a distinct, semi-corporate body with sympathies divorced from those of a progressive, free-spirited people."

Scholars such as Simon (1976) emphasizes the importance of a well-established bureaucracy where he believes the factual element of political decisions lay. They believe bureaucrats may be vulnerable to personal goals and ambitions that they seek to achieve through the organizations they lead and therefore reject any external interference. Simon further observes that the importance of bureaucracies means that they have to be not only compliant but also neutral at all times. Finer (1941) gives a more skeptical view of the bureaucrats especially if their actions are regulated by internal mechanisms rather than external factors such as the judiciary or legislature. For Finer, allowing bureaucrats to self-check their action through internal methods is open for abuse.

## Contextual Framework

To give the relationship between administration, politics, and bureaucracy a contextual design, this paper looks at two approaches. First is the principal-agent theory a theory that emerged in the field of economics in the mid-1970s and later adopted in public administration. The theory highlights the nature of engagements between the bureaucratic agent and the political principle. It is based on the assumption that the political principal is seeking the services of the bureaucratic agent, but in the process, the principle is doubtful of whether the agent share similar preferences or is willing to share all the information they possess. Aware of the agent's ability to influence and capacity to access information, the principle is continuously seeking to develop measures to structure, monitor, and sanction the agent.

The second approach is the relationship between top bureaucrats and politicians. This approach has increasingly gained significant

attention among scholars due to the growing trend of increased interaction between the two actors. Aberbach et al. (1981) argue that whenever top bureaucrats interact with politicians, a "creative dialogue" ensues which makes it difficult to identify who has an upper hand in influencing the other. They identify that politicians seem to be driven by in their approach while bureaucrats tend to be cautious and rely on facts in responding to the politicians. Studies that followed concluded that indeed top bureaucrats maintain a close relationship with the political elites whom they give advice and guidance in policymaking processes. Whether the politician or bureaucrat has an upper hand in influencing the final decision, it is important to acknowledge that both parties need to make concessions for the sake of smooth administrative outcomes.

Two important approaches of contextualizing the relationship between political and bureaucrats are autonomy and separation. The former refers to the "amount of freedom and extent of independence in which public servants can perform their duties without being influenced by political players. The former is used to refer to the 'extent to which the bureaucracy is distinct from the political system" (Dasandi and Esteve 2017). The manner in which countries adopt the principle of autonomy and separation differs from one country to another.

## Links Between Administration, Politics, and Bureaucracy in Developed Countries

The common characteristics of the developed countries' administration can be regarded as well-structured, advanced, and developed. Most industrial-based democracies such as Canada, Japan, UK and the USA fall under this category. In several indexes, developed countries enjoy higher standards of living as their citizens have access to higher income levels, better health care system, very high literacy rate, as well as production and consuming of sophisticated and modern technologies. In terms of governance, these countries enjoy efficiencies, equality, and the rule of law for all citizens, which are some of the main indicators. In making and implementing public policies, developed countries have comparatively effective governance, management, bureaucratic, political, and administrative systems. In addition, developed countries' public policies always depend on their society's requirements and demands meaning increasingly adopting bottom-up policymaking processes. Usually, citizens of developed countries play a big role and are active participants in the process of governance, a role provided for and protected by their constitution. To understand the links and relations between administration, politics, and bureaucracy, it is important to classify the concepts, practices, and evolvement of the administrative system in the developed countries. Dominant system of governance as well as the institutions has been applied in the developed countries to reach the high level of performance.

Historically, between 1650 and 1850, the West including European countries experienced three revolutions. These were: English Revolution of 1688, the American Revolution of 1776, and the French Revolution of 1789, which lead them to change and restructure their administrative systems and abolish the status quo in comparison to countries in the non-Western world (Jerisat 1997, p. 13). Political and economic realities demand different level of skills, commitment, and values to run the state and its administration. The changes that emerged with the liberal constitutional state after the collapse of absolute monarchies changed the government's responsibility with emphasis on the protection of human rights and liberties and promoting Laissez faire system. The citizens became more involved in governance, the public sector begun to experience rapid reforms that emphasize on merit.

In the developed countries, political-bureaucratic relations are characterized by clear role separation between politicians and bureaucrats. Strong collaboration between the executive and bureaucrats in administrative processes can be seen and while both parties may have some autonomy to take certain decisions, such privileges are guided by the law which creates strong political and bureaucratic institutions. In countries such as Australia, Canada, Japan, South Korea, UK, and

the USA, there is a developed legislative and legal framework within the civil service that require public servants while creating a balance with the political players. Administrative process for the bureaucrats is dominated, recruited, and promoted based on the meritocracy. Most of the developed Western and democratic countries follow the Weberian model in their administrative system, and thus influence the relations between politics and administration in that manner (Hansen and Ejersbo 2002). Though in theory developed countries should be immune to negative interference of bureaucracy by political elites and vice versa, in reality, the opposite is true. More so with the increasing populism trends in some of these countries which has led to intimidation of public servants. Apart from direct and negative, which is arguably much lower in developed countries than in developing ones, there are other forms of interference that may be unintended or a consequence of the administrative structure. Noticeably, there are constant efforts and reforms aimed at increasing the degree of separation between political and administrative responsibility and accountability (Svara 2006).

Such reforms are often intended to increase the autonomy of the bureaucracy while at the same time ensuring that the needed cooperation between the two entities is achieved. An important distinction is that in the event a politician is appointed in the bureaucracy, he/she is required to adhere to the code of conduct strictly and remain impartial at all times. Some other salient features that characterize the links between administration, politics, and bureaucracy include integrated and collaborative system of power distribution, mostly to maintain the effective and efficient relations between bureaucracy and politics; this means that to achieve the desired outcomes, politicians and bureaucrats not only have to work closely but also adopt relevant technologies and administrative strategies to complement their efforts. Most of the administrative structures in developed countries have embraced approaches from the private sector and also cooperate with non-state actors through initiatives such as public private partnership (PPP). These new systems not only reduce the tension between bureaucrats and politicians as several services are now being provided by private sector, it also brings on board a third actor who can break the deadlock in case agreements between the two are in jeopardy. Nonetheless emphasis is laid on ethics and accountability for both administrators and political elites when discharging their duties.

Among the developed societies, public administration and political actions are managed through a set of checks and balances that legalize the connections between the political and bureaucratic institutions in the country. Both the political elites and bureaucrats are not only required to act within the parameters of the law but also violations of the guiding principles are taken much more seriously. Different arms of government work in a well-choreographed manner which ensures accountability and sufficient monitoring of each actor's actions. These regulations also provide a defined avenue of engagement that is supposed to be respected by the politicians and public servants for the broader good of the country.

The trend of having distinct but collaborative relations between politicians and public administrators can be seen in Western but also many non-Western countries such as Singapore, South Korea, and Japan. These countries exercise a good balance between the political and bureaucratic elites. This can be attributed to the high level of autonomy the public sector enjoys in these countries. Clear demarcation of the roles and responsibilities often creates a phenomenon where public servants act as implementing agencies for the political executive. This should not be mistaken to mean subordination of the bureaucracy but rather a classical case of separation of roles. The objective is to reduce the possibility of overlapping functions between the two actors and increase speed and efficiency in decision making. The success of this kind of system depends heavily on the political neutrality of those working in the bureaucracy. This is because, most democratic societies experience frequent change in governments, and therefore if public servants are inclined to certain political ideologies, then such frequent changes will lead to serious disunity in the public sector.

## Links Between Administration, Politics, and Bureaucracy in Developing Countries

Administrative system in most developing countries reflects the model left behind by the colonial administration. Most recently, however, several countries have undertaken serious reforms to reshape their administrative structures. This has been influenced by a number of domestic factors such as the desire to fulfill government role in provision of services to the people and by external factors such as growing regional and international interactions as well as the impact of globalization. Similarly, conditions set by donor countries and agencies on developing countries have also sought to reshape the administrative characteristics of these countries and more importantly the relationship between public servants and politicians. However, some of these efforts are yet to yield the desired outcomes partly due to skepticism often associated with proposals and recommendations from external actors more so former colonial powers. Secondly, since most of the donor agent-driven reforms are based on integrating private sector practices in the public sectors (see ► "New Public Management"), the limited success is also associated with the simplistic approach that does not put into consideration the understanding and practice as well as limitations of the private in the developing countries. The impact of this has been little progress in the efforts to reduce the influence of politics and political elites in the bureaucracy.

One prominent feature of bureaucracy-politics relations in developing societies is patronage. While this is a feature that even developed countries have once experienced, it is the extent and slow progress in dealing with the perpetrators of such actions that raises concerns in developing countries that stands out. Upon independence, most developing countries did not have an elaborate private sector that had the ability to employ many people. Combined with the euphoria that came with independence, the public sector became the leading employer as governments attempted to live up to the hopes and aspirations of their people during the struggle for independence. This made employment into the public sector a political tool used by the elites to reward their support base. In addition, at the core of the patronage problem is the lack of sufficient reforms in the civil service in order to introduce a merit-based recruitment and promotion system. This left the public service in developing countries blotted and with less qualified personnel which affected productivity and triggered a vicious cycle of poverty, underdevelopment, political patronage, and inefficiency. Developed countries on the other hand continue to benefit from reforms made in the civil service that not only allows some of the best and qualified individuals to engage in public service delivery, but also it allows for separation between politicians and bureaucrats.

The close link between the political elites and bureaucrats has led to serious economic and administrative problems. One of them is that it gives room to unchecked corruption which continues to be a crisis in developing countries. Even worse is that those responsible for loss of public resources either through theft or dubious projects that have no economic value do not take responsibility and are often recycled in various government departments. It is not surprising to find that the top 20 worst countries performing on the corruption index are from the developing countries which tend to lose more money than they borrow from donors for development. Corruption has turned most administrative units in developing countries inefficient and characterized by impunity. This is seen through deliberate actions by the politicians and bureaucrats who become barriers to administrative reforms.

The nature of relations between bureaucrats and politicians in developing countries is further shaped by other factors beyond the desire for efficiency and effectiveness. For example, resources and power that bureaucrats possess and can benefit politicians and vice versa significantly influence their interaction. Financial, institutional, and informational resources shared between politicians and bureaucrats but useful for both encourages both parties to work closely. This can be seen with judiciary and prosecution officers who may delay corruption or abuse of

office charges on politicians while politicians can facilitate speedy promotion for the bureaucrats. Such cooperation triggered by the desire to benefit from each other's resources negatively affects administrative roles of bureaucrats.

The second factor that influences bureaucracy-politics relations is representation. In theory, public servants are supposed to represent the view, goals, interests, and aspirations of the general public and remain neutral. However, in developing countries and some developed countries also, representation may have a different meaning. In this case, representation based on identity, be it ethnic, religious, racial, or clan representation, is a common trend among developing countries. Weak institutions and polarizing political processes have seen job opportunities in the public sector become a tool for promoting one's own support base and an important means of shaping attitudes and opinion of their support base at the same time strengthening control of the country's political and bureaucratic spheres. This has resulted not only into horizontal inequality but also catalyst of civil wars.

Third factor is career progression and recruitment into the civil service. According to Weber's ideal system of bureaucracy, recruitment and promotion of individuals must be based on merit. In the absence of merit-based recruitment, civil services are characterized by corrupt, unskilled, and incompetent bureaucrats who need the support of the political elites to remain in office thus eroding their independence. To curb this problem, developed systems have adopted entry exams as a means of recruiting public servants. This is useful in making civil service more prestigious, dominated by highly skilled people and autonomy in decision making. Performance becomes the basis of career progression as opposed to political and personal ties. It is worth noting that some developing countries have also begun implementing merit-based recruitment processes as well as introduction of programs that improve the quality of public service personnel through in-service training.

The forth factor influencing relations between bureaucrats and politicians in developing countries are interests, values, and motivation. While research on how self-motivation and interest to further public well-being has been studied among politicians, such traits are not only limited to political elites but can also be traced among bureaucrats. In some Asian countries, Confucius' principles such as benevolence, goodness, and order (hierarchy) are dominant, while in some Muslim majority countries, principles such as trustworthiness (*Amanah*), responsible (*Tanggungjawab*), sincerity (*Ikhlas*), dedication (*Dedikasi*), moderation (Sederhana), disciplined (*Berdisiplin*), collaborative (*Bekerjasama*), virtuous (*Berbudi Mulia*), and grateful (*Bersyukur*) are prominent in the bureaucracy, politics, and civil service. Of importance is how strong culture and desire towards bringing change and development in a country strengthen the relationship between political and public servants. There are also some relations and values that are strengthened through networks established at elite schools and universities whose graduates seem to dominate top administrative and political positions. Some of them develop similar ideology and mentality that can either forester cooperation or cause rivalry if the actors are from different backgrounds. In most developing countries, politics and bureaucracies are dominated by people from particular lineage or class which tends to shape their relations.

## Conclusion

Previous studies on the relations between politics and bureaucracy relate and influence each other predominantly focusing on established democracies and developed countries. The nature of such relations in developing countries has often been ignored. Yet the interaction between these two entities is increasingly becoming an important aspect in understanding why some developing countries are struggling to take off and experience rapid and sustainable growth. Similarly, little emphasis on developing countries' public administration trends has left analysis of the bloc on the lenses of developed countries yet there are several striking differences among them. This explains why the "best practices" approach floated by donor agencies is not often successful. This study presents a comparison on how political-

administrative and bureaucratic relations are experienced in both developed and developing systems and countries. While the study has given a general analysis and not a case study of specific countries, it provides a basis for future research on country case and comparative studies.

# Living Lab

Rianne Dekker and Albert Meijer
Utrecht University School of Governance, Utrecht, The Netherlands

## Synonyms

Design methodology; Innovation labs; Living laboratories

## Definition

Living labs are a research and design methodology applied by research institutes in cooperation with public and private partners for developing and testing innovations in co-creation with users in real-life settings.

## Introduction

Living lab refers to both a methodology to experimentation and innovation and the physical spaces in which this is situated. The methodology helps tackling problems at hand by *designing* and *testing* of new solutions. "Living labs" or "living laboratories" were originally developed for technological innovation in the 1990s. Since the 2000s, living labs have been an emerging practice in the social sciences, focusing on social innovation. Surprisingly, public administration research has paid scant attention to living labs to date.

An obvious obstacle to application of a living lab approach in public administration research is the lack of conceptual and methodological clarity (cf. Bergvall-Kåreborn and Ståhlbröst 2009). A large variety of research practices has been gathered under this label. In some cases, living labs are collaborative practices embedded in research projects, and in others they are experimentation sites that are part of a university or government institution.

This entry in the *Global Encyclopedia of Public Administration, Public Policy, and Governance* presents an overview of key characteristics of living labs, common objects under study in living labs, and research methods that are used in living labs to evaluate the design. It then offers an assessment of the value of this research methodology for public administration and contributes practical, methodological, and ethical guidelines to implement the living lab approach in public administration research.

## Key Characteristics of Living Labs

Four key aspects of a living lab recur in different applications. First, living labs use an iterative process of gradually improving and refining a product in successive stages of research and design. Studies generally distinguish three to six phases in the research and design cycle (Almirall and Wareham 2011). Usually, the initial phase entails inventory of users' needs and wishes, the middle phase(s) the design of a prototype, and the last phase evaluation of the product or service. Key to living labs is that the process can take spontaneous turns and yield unexpected results. The end result of the process is not fixed at the beginning. In successive iterations, the design improves and becomes more concrete. The living lab therefore has a medium- to long-term time span (Følstad 2008). In many cases, the living lab is not just a temporary test bed, but it *is* the product or service that remains available to the users for a longer period of time.

A second core element of a living lab is that it is a cooperation between multiple stakeholders – varying from universities to businesses, government organizations, and NGOs. These stakeholders each have an interest in the product or service that is being developed, and they deliver input from various perspectives. As a result, living labs are often public-private partnerships and usually co-funded by the participating stakeholders.

The third core element of living labs is the locus of the research and design process. This is the physical setting in which the product or service is envisioned to be implemented. These can be people's homes, organizations, cities ("urban living labs"), or regions. Innovations are developed to fit the specific local context. At the same time, this real-life setting means that the naming of living labs after controlled *lab* environments is misleading and indicative of how social science tends to uncritically adopt concepts from the natural sciences.

The fourth and last core element of living labs is that users are closely involved as "co-creators" of the product or service. They are considered to have specialized knowledge from a user perspective. They are involved from the early onset of the innovation process, and their experiences and preferences become part of the product or service that is being designed. This is also referred to as "user-driven" innovation. It is sometimes asserted that involvement in the living lab will (creatively) empower the individual user or the community as a whole. However, there are also ethical risks involved with user-driven innovation. Users often do not have a say in the scope of the living lab, and the innovation that they co-create is sometimes taken away after the innovation process ends.

## Objects of Study in Living Labs

By definition, all living lab studies focus on innovation, but what innovations have been studied through living labs? There is still an obvious link of living labs to studies of ICTs, focusing on ICTs' usability. This is relevant for public administration as public innovation often involves new technologies. Several living lab studies focused on the topic of e-government and e-participation. Also, many living labs have urban development, rural development, or smart cities as their object of study. Smart city living labs link ICTs to urban development with big data. Other studies of urban and rural development investigate, for example, participative governance arrangements in cities and (sustainable) energy. Also, applications of the living lab have emerged in governance domains such as healthcare, education, and mobility.

Living labs tend to focus on socio-technical innovations including many topics that are relevant to PA. This indicates that living labs are a suitable approach to support and study processes of social and in particular public innovation as well. Living labs can help develop new policy and governance solutions related to grand societal challenges such as democracy and participation, urban development, and sustainable energy.

Besides studying innovation in specific public services or policy solutions, living labs can also provide insight in the overall process of public innovation itself. Living labs entail "collaborative" or "open" processes of innovation. They can also provide insight in collaboration in public-private partnerships and co-creation of products or services with users. Indeed, a number of living lab studies focus on the process of public innovation (e.g., Van Geenhuizen 2013).

## Research Methods of Living Labs

The design process of living labs is often organized in a bottom-up, trial-and-error fashion. Because of successive iterations of design, living labs usually include multiple moments of measurement. There is large variation in the research methods used for this. The most common research method of living labs is continuous monitoring the use of the product or service by users in the real-life setting of the living lab. In many original applications of living labs for technological innovation, the product itself generates user data. In other studies, user behavior is monitored by way of observation.

Cross-sectional collection and analysis of qualitative and/or quantitative data are also common. Surveys and interviews are conducted with users about their experiences. Some living labs take a quasi-experimental design including an ex ante and ex post test of user experience. The main benchmark used in evaluating solutions is the user experience. If users are not satisfied with a mid-term outcome, the design process will take another iteration. In many living labs, there is also attention for stakeholders' satisfaction with the innovation process and intermediate designs.

Little methodological consistency and standardization can be found among living labs. Also, there have been scarce efforts to conduct empirical assessments of the merits of the living lab approach, either in comparison with other methodologies or to understand the long-term impacts of living labs. Dekker et al. (2019) conclude that the ecological validity of living lab studies is generally high. Observed behavior can be generalized to natural behavior in the world as products or services are tested in a real-life setting with intended user groups. When interventions are introduced in the users' own context, implementation effects are avoided, and evaluative claims are likely to be well grounded. Due to the lack of a control group or a controlled environment, however, also Hawthorne effects are likely to occur. Users are closely involved in all phases of the research and design process, and there is extensive attention for their needs and wishes. Therefore, improvement in user experience throughout the project may result from the living lab setting instead of the improved product or service.

High ecological validity of living lab studies generally goes along with lower external validity and generalizability of findings. Because of the specific research setting in which the product or service was designed, evaluative claims can be generalized to other user groups or settings only

to a limited extent. Related to this, the scalability of living labs is a concern: extending the scale or transferring the model elsewhere has proven difficult. Also ethical issues are present as living labs require informed consent of users for their participation over longer time periods. Furthermore, it may not be ethical to again withdraw the product or service from the users after the development process has finished.

A research opportunity for public administration is that living labs accelerate dissemination of knowledge between academics and practitioners (Van Geenhuizen 2013). However, balancing the interests of partners in the living lab can be a challenge – not only in implementation of the living lab but also in dissemination and (commercial) exploitation of the developed product or service. Stakeholders in the living lab may object dissemination of information before they have access to the finished product or may specifically object dissemination of information on failed designs and shortcomings in the design.

## Practical, Methodological, and Ethical Guidelines for Living Labs in PA

Living labs show good potential for research into public policy and public administration, but the approach has bring several challenges and limitations. Guidelines for action research provide an important basis for enhancing methodological robustness. In addition, specific features of living labs require specific attention. For that reason, drawing upon the corpus of literature on research in the social sciences, Dekker et al. (2019) developed guidelines for living labs in public administration that can be used to strengthen the designs of living lab projects; to tackle methodological, practical, and ethical issues; and to enhance the value for practitioners. These are discussed below and summarized in Table 1.

1. *Methodological robustness*. More systematic reporting of the research design is advised including reflection on methodological limitations to help others to better situate the findings and their broader relevance. Other guidelines

**Living Lab, Table 1** Guidelines for living labs in public administration research

| | |
|---|---|
| Methodological robustness | *Project initiation* |
| | Report the specific starting situation and aims for which the living lab was implemented to prevent pro-innovation bias |
| | Develop a research design and indicate at the start how and under which conditions this can be adapted |
| | *Data collection* |
| | Use mixed methods to collect information from different angles or motivate the choice for one specific method of data collection |
| | Engage different researchers in the collection of data to prevent a bias in the observations |
| | Ensure that user experience is part of data collection and analysis |
| | *Data analysis* |
| | Apply process tracing to analyze effects of interventions |
| | Engage a devil's advocate in the analysis to challenge analyses and conclusions and to prevent group think |
| | Engage an independent analyst to assess the role of researchers |
| | *Reporting* |
| | Explicate to what extent the study adheres to various elements of the living lab definition |
| | Report on both successful and failed living labs |
| | Report the roles and interests of researchers and other stakeholders in the living lab |
| | Present an explicit reflection on the impact of context and process characteristics on the research findings |
| Practical implementation | Clearly define the role of each partner in the living lab and apply methods of process management to the implementation of the living lab to ensure productive collaboration and mutual trust |
| | Reach an explicit agreement about the balance between the societal and academic outputs of the living lab |
| Ethical and legal issues | Provide a clear operationalization of the key principles guiding interventions: informed consent and |

(continued)

L

**Living Lab, Table 1** (continued)

| | |
|---|---|
| | do no harm, given the intensive and long-term engagement of users |
| | Inform stakeholders and users about the double role of the researchers: contribution to the lab and academic knowledge production |
| | Obtain explicit and continuous permission from the stakeholders that this information can be used for independent research and academic publications |
| | Do consider not only the effects for target groups in the living lab but also external effects such as damage to the broader environment |
| | Have the living lab reviewed by an institutional review board that takes both the practical and academic value into account |
| | Conduct an ex ante legal analysis to identify legal risks and find appropriate ways of dealing with them |
| Value for practitioners | Build strong methodological knowledge about living labs and convey this to practitioners when they are designing a living lab |
| | Engage both in a supportive and a critical way with stakeholders in the living lab: be a critical friend |

include registering the living lab project before the start to prevent a pro-innovation bias in the reporting of results and stimulate publication on "failed" living labs, the key role of process tracing in theory development and doing this with outsiders to prevent groupthink, and explicit reflection on the role and position of researchers in the reporting of results of living labs as is common in interpretive research.

2. *Practical implementation*. Before starting the living lab, the role of each partner should be explicated. Principles of process management can be applied to the living lab to ensure a productive collaboration with stakeholders and end users. Multiple and even conflicting views on the product or service are not inherently problematic but will contribute to the applicability of the design. The partners should reach explicit agreement about the balance between commercial, societal, and academic outputs of the living lab and moments and ways to disseminate them.
3. *Ethical issues*. Continued informed consent of users involved in living labs is crucial. Users need to understand that the lab is used for generic (and sometimes commercial) knowledge production and that living labs may end when this process is finished. They also need to be able to end their commitment to the living lab at any time. The interests and integrity of the research partner may be pressured by diverging interests and limit the independence of research. Therefore, ex ante analysis of ethical risks is recommended.
4. *Value for public administration practice*. To tackle the challenge of sustainable funding and scalability of living labs, it is crucial to show the value of these labs for practitioners and private stakeholders. The value of continued social experimenting has to be demonstrated. To this end, researchers should not only engage in instrumental analyses of the lab but also contribute reflection on the desirability of interventions. Also, they should advise on transferability and scalability of certain aspects of the living lab, rather than the full concept.

## Conclusion

The living lab fits a trend toward experimentalist and design-oriented approaches in public administration (Sabel and Zeitlin 2012; Bason 2016) and offers a specific methodology. This answers a call for generating more usable knowledge for practitioners to tackle grand societal challenges (Perry 2012; Pollitt 2017). Living labs build upon the tradition of (participatory) action research in their aim to produce both scientifically and socially relevant knowledge and transformative action but put an emphasis on an iterative process of design and testing and co-creation with users. In comparison with design experiments and innovation labs (McGann et al. 2018; Tõnurist et al. 2017), living labs place more emphasis on iterative ways of learning-by-doing and are less

focused on developing a common conception of the problem and solution. These specific elements make living labs an interesting method for studying the effects of newly developed policy interventions and public services and also processes of public innovation, collaboration in public-private partnerships, and co-creation.

The living lab approach is, however, only just emerging in the field of PA. A common definition, robust methods, and normative questions demand attention in order to make this approach valuable to public administration research. Dekker et al. (2019) propose a definition and a set of guidelines that can form the basis for using living labs in public administration research. The set of guidelines for living lab research for public innovation offers directions for methodological robustness, practical implementation, dealing with ethical issues, and highlighting the value of living labs for practitioners. All in all, it is argued that living labs broaden the methodological toolkit of research into public administration, not as a method in its own regard but as a research approach combining a number of methods and techniques in a novel way and setting.

# Lobbying

Meeyoung Lamothe and Elizabeth Bell
The University of Oklahoma, Norman, OK, USA

## Synonyms

Civic engagement; Political activity

## Definition

Around the world, lobbying is commonly referred to as any activity undertaken by interest groups, including nonprofit organizations, to influence the legislative or public policy-related actions of lawmakers and public officials. What constitutes lobbying and the extent to which such activity is regulated is largely determined by sovereign governments. In the United States (US), nonprofit legal experts as well as practitioners define lobbying more narrowly as efforts to impact specific legislative actions, such as supporting or opposing pending legislation.

## Introduction

Despite the rapid growth of the nonprofit sector and the proliferation of research in this field, nonprofit lobbying is an area that presents several challenges for scholars and practitioners. For example, there has been confusion over the exact definition of lobbying and how it differs from advocacy. In addition, legal and regulatory frameworks for nonprofit lobbying are not as straightforward as they might appear and are evolving frequently. In terms of academic research on this topic, scholars have only recently started fully exploring lobbying and other political activities by charitable organizations. The purpose of this chapter is to provide a broad overview of the concept of nonprofit lobbying and the current state of knowledge on the topic.

The following section begins by discussing how lobbying is understood by scholars and practitioners including specific activities considered to be lobbying and how these activities differ from other types of political participation by nonprofits. The next section reviews legal and regulatory regimes regarding nonprofit lobbying. While nonprofit lobbying is a global phenomenon wherever civil society exists, legal and regulatory schemes affect the scope and nature of lobbying and differ significantly across countries and continents. In recent years, international non-governmental organizations (INGOs) have played a significant role in mobilizing resources to lobby the United Nations (UN) and other multilateral organizations for global policymaking. The extent and effectiveness of an INGO's advocacy and lobbying in nation-states, however, varies tremendously and depends on the openness and stability of the political system and legal environment of the country in which the INGO is attempting to effect policy change. For instance, while non-Western countries may severely limit lobbying by nonprofits, the United States and Western Europe generally permit such activity, but regulate it under established legal frameworks. The US regulatory structure is explored as a specific example in this section. In the third section, the discussion is focused on the importance of the role of nonprofits in representing marginalized groups in policy agendas as a way to think about potential implications of limiting nonprofit lobbying. The remaining sections examine the current state of scholarly findings, largely based on the Unites States literature, on the extent to which nonprofits engage in lobbying, the barriers to lobbying, and the organizational characteristics associated with increased engagement in lobbying activities.

## Lobbying Terminology

Prior to discussing the specifics of nonprofit lobbying-related issues, there is a need to clarify what the term, lobbying, entails in the nonprofit literature and how it is differentiated from other terms such as advocacy, political activity, or electioneering. This is necessary partly because, unlike legal experts and nonprofit practitioners, academic scholars sometimes do not draw sharp contrasts among these terms in their research. For example, Berry and Arons (2003) define "lobbying" quite broadly to include any activity undertaken to influence policymakers' understanding of issues or their action on them, although they acknowledge the legal distinction that exists and study how such regulation limits nonprofits' ability to lobby. Likewise, scholars such as Chaves et al. (2004) interpret the term, "political activity" broadly to accommodate lobbying, advocacy, as well as other activities intended to influence public policy processes, while nonprofit practitioners understand political activity as electioneering that is strictly prohibited. Even among nonprofit practitioners, confusion seems to be widely present as to precisely what constitutes lobbying and to what extent nonprofits are allowed to be involved in such activities.

Generally speaking, typical lobbying activities include contacting lawmakers to encourage them to sponsor certain legislation or vote for or against pending bills. This is considered direct lobbying. There is also indirect, or grassroots, lobbying. Grassroots lobbying involves encouraging the general public to influence lawmakers' actions, rather than the organizations appealing directly to legislative bodies, themselves. The strict and narrow understanding of what legally constitutes, or is regulated as, "lobbying" helps nonprofit

practitioners navigate the complex regulatory environment when participating in the political process. In other words, a clearly defined, legal understanding of lobbying allows nonprofit managers to separate lobbying from a broader set of advocacy activities intended to influence public policies such as disseminating information, conducting research, litigating or testifying in court, or holding protest events. Political campaign activity is further distinguished from advocacy and lobbying activities as it only refers to actions taken in support or opposition to specific candidates for office. Political campaign activity can be anything from contributing money, endorsing, or offering favors to particular candidates.

## Lobbying Regulation in the United States

Clarifying lobbying terminology is important because of different legal and regulatory implications associated with it. But why regulate lobbying? The purpose of this section is to discuss the extent to which nonprofit lobbying is regulated and the rationales behind such restrictions. Despite the varying scope and intensity in different polities, nonprofit organizations and voluntary associations are generally regarded as the embodiment of civil society and social capital. In democratic regimes, these organizations, especially civic and advocacy nonprofit entities, thrive outside of formal political institutions and serve as the primary vehicle through which citizens express and exchange policy preferences, organize political activity, and demand government action. Civic engagement and the use of nonprofits as organizational venues for political participation are limited or even severely suppressed in countries where democratic governments are absent or dysfunctional.

In democratic systems, associational rights and freedom of speech are usually granted and protected to the fullest extent. However, this does not mean that power and access to government decision-making by civic groups are unfettered. On the contrary, attempts to influence legislation and intervene in election processes by nonprofit organizations and voluntary associations are often regulated activities. A challenge has been to promote the role of civil society in democracy without allowing its undue influence on government. Examining nonprofit lobbying-related regulations in the United States might effectively illustrate the effort of government to balance the role of nonprofits in a democratic polity and the challenges associated with it. It should be noted that specific rules and regulations discussed in this example will have only limited applicability to other democratic countries where legal and political systems might be different from those of the United States.

In the United States, freedom of speech and rights to form associations, including rights to petition government to address grievance through these associations, are constitutionally guaranteed. However, the extent to which nonprofits can assert their rights to influence public policy is complicated under the US legal framework, especially charitable tax law. In the United States, nonprofit organizations receive a variety of generous tax benefits from government, although the types and scope of the benefits differ, depending on whether they are classified as charitable organizations whose main missions are to promote the public interest and the welfare of the general public or as various noncharitable entities that primarily pursue policy advocacy or support the well-being of their members. While all types of nonprofits receive corporate income tax-exemption benefits, charitable organizations, which are also called 501c3 organizations according to their tax classification code, enjoy special tax treatment for their donors due to their broad public missions. That is, people who financially contribute to qualifying charitable nonprofits can claim deduction of their donation from their taxable incomes. This comprises sizable forgone tax revenues for government and is seen as a form of government subsidy to the charitable nonprofit sector.

It is this government subsidy that provides a rationale for limiting 501c3 charitable organizations' lobbying activity. Both the US Congress and the courts agree that the government should not fund nonprofits' lobbying geared toward influencing its own legislative actions

(Colinvaux 2017). Limiting charitable organizations' lobbying is not without debates, however. One reason for the critiques of such regulation is that charitable organizations often represent the underprivileged and politically underrepresented segments of the society and should be given a place in public policy debates to speak on behalf of the voiceless. This unique role played by nonprofit organizations in the political process is further explored in the next section.

The compromise that the US Congress made to ease the tension between constitutional rights and regulatory needs was the passage of the Tax Reform Act of 1976 (Public Law 94-455) that allows 501c3 charitable nonprofit organizations to lobby to a limited degree, but with much clearer guidelines than what was available before regarding the legal definition of lobbying, the exclusion of activities that are otherwise considered lobbying, and a reduced punishment for excessive lobbying (United States Congress 1976). More specifically, under this new legal scheme, charitable nonprofit organizations' lobbying activities fall under two alternative tests to determine their compliance with lobbying regulations: the "no substantial part" test that had existed under the old scheme and that is still the default rule and the "expenditure" test that has become available after the passage of the 1976 Tax Reform Act (Internal Revenue Code §§ 501(h), 4911). In the United States, the main federal tax law enforcement organization that monitors nonprofits' compliance with the tax law is the Internal Revenue Service (IRS), the agency that is also responsible for enforcing federal individual and corporate income tax collections and refunds. Section 501(h), the IRS tax code authorized under the 1976 Tax Reform Act, enables charitable organizations to be subject under the "expenditure" test, if chosen by the nonprofits, rather than the traditional "no substantial part" test for their lobbying limit compliance (Internal Revenue Code §§ 501(h), 4911).

Looking closely at these two tests, charitable nonprofits that do not elect 501(h) for their lobbying and thus fall under the "no substantial part" test must comply with the IRS regulation that lobbying should not consist of the substantial part of their activities in order to maintain 501(c)(3) status (Internal Revenue Service 2016). In other words, a 501(c)(3) organization may engage in some lobbying, but cannot pursue such activities as the main mission of the organization. To be clear, these restrictions apply only to lobbying and not to advocacy activity as alluded to in the previous section. Thus, while charitable organizations may jeopardize their tax-exempt status by committing a substantial portion of their activities to contacting and persuading members of a legislative body to adopt or reject specific legislation, they are not limited in their ability to engage in activities that bolster education and awareness of public policy issues and even provide consultations to lawmakers regarding general policy matters.

Separating what is considered lobbying from a broad spectrum of advocacy activities is relatively straightforward in the IRS rules. What appears to be rather ambiguous is how to determine the extent of lobbying that may constitute "substantial" because such determination is not only based on lobbying expenditures but also considers volunteer time spent on lobbying, the regularity of their activities, and even the extent of publicity the organizations garner regarding their lobbying. Many of these factors can be circumstantial rather than hard facts and thus are likely to invite subjectivity in judgment. Some courts argued that more than 5% of expenditures constitute a substantial part, but the IRS denies the existence of such a clear-cut rule of thumb. If the lobbying activity is determined to exceed the legal limit defined or interpreted by the IRS, the organization may lose its tax-exempt status, which makes all of its income taxable or may incur an excise tax for 5% of lobbying expenditures during the year in which the substantial lobbying activity took place.

Electing to go under 501(h) and the related "expenditure" test for lobbying compliance presents many advantages for US charitable organizations that wish to actively lobby lawmakers. The expenditure test involves a more in-depth analysis of how much money the organization has spent on lobbying activities and accounts for only monetary expenditures when determining nonprofits' compliance with the regulation. By focusing regulation only on expenditures rather

than types and intensity of activities, the expenditure test expands nonprofits' ability to increase their engagement in lobbying. This test also clarifies further what constitutes lobbying for the purpose of regulation and what is excluded from such activity. The list of exclusions includes not only policy advocacy and consultation to lawmakers but also self-defense-related lobbying and any contact with executive branch officials over program implementation issues.

An important distinction in the expenditure test is whether the lobbying activity is classified as direct or grassroots lobbying. According to the 1976 Tax Reform Act, 501(c)(3) charitable organizations may spend one fourth as much on grassroots lobbying as on direct lobbying and may only spend a total $1 million on both. However, if the lobbying activity does not involve direct expenditures of money by the organization, it does not count against this $1 million limit. A summary of the lobbying expenditure limits based on the size of the organization (measured by the amount of exempt purpose expenditures) is presented in Table 1 below.

The 1976 Tax Reform Act also implemented transparency requirements under the Lobbying Disclosure Act for 501(c)(3) charitable organizations requesting the expenditure test that have professional lobbyists and spend more than $24,500 on lobbying at the federal level. Consequently, those 501(c)(3) charitable organizations are required to report lobbying expenditures to congress as well as reporting them in their annual filing with the IRS. If the organization is determined to have engaged in excessive lobbying for more than 3 years, tax-exempt status will be revoked, and all of the income for that time period is then subject to taxation. However, if the organization only exceeds the lobbying limits in a particular year, it is subject to a 25% excise tax on the excess expenditures instead.

**Lobbying, Table 1** Breakdown of the expenditure test

| If the amount of exempt purpose expenditures is: | Lobbying nontaxable amount is: |
|---|---|
| ≤$500,000 | 20% of the exempt purpose expenditures |
| >$500,00 but ≤$1,000,000 | $100,000 plus 15% of the excess of exempt purpose expenditures over $500,000 |
| >$1,000,000 but ≤$1,500,000 | $175,000 plus 10% of the excess of exempt purpose expenditures over $1,000,000 |
| >$1,500,000 but ≤$17,000,000 | $225,000 plus 5% of the exempt purpose expenditures over $1,500,000 |
| >$17,000,000 | $1,000,000 |

The discussions above regarding the specifics of lobbying regulation are limited only to 501c3 charitable organizations, especially public charities. Private foundations, which are classified under the same tax code as 501c3 public charities and thus receive similar tax deduction benefits for their donors (but a lower level of deduction benefits than those for public charities), are subject to stricter lobbying regulation in that they are basically prohibited from engaging in any lobbying activity, although just as the case with 501c3 public charities, they are fully entitled to be engaged in advocacy. In fact, private foundations have been major supporters of various social and rights movements in US history through their activism in advocacy. One of the underlying rationales for the lobbying restriction by the government is to curb potentially undue influence on public policymaking processes by powerful private interests. The US government, however, allows private foundations to make general-purpose grants to charitable nonprofit organizations as long as the grants are not earmarked for lobbying.

It should also be noted that noncharitable organizations, most commonly social welfare organizations, labor unions, and business trade groups, which are classified under 501c4, 501c5, and 501c6 tax codes, respectively, are granted unlimited lobbying power by the US government to advance their policy and legislative agendas without jeopardizing their tax-exempt status. This status is given to noncharitable organizations partly because donors to these organizations are not subsidized by the government for their

contributions. That is, contributions to noncharitable nonprofits are not allowed to be deducted from the taxable incomes of donors. Since the money noncharitable organizations spend on lobbying comes from after-tax dollars, the government has weaker grounds to limit lobbying, a form of political speech, by these private nonprofit groups.

## Normative Considerations

The importance of the role of nonprofit organizations in representing certain segments of populations in the political process was briefly mentioned in the previous section. This section highlights the implications of government regulations on nonprofit lobbying for equitable representation and effective governance. It also details the arguments that have been made in opposition to restrictions on nonprofit organizations' ability to lobby the government.

Some scholars view regulations on nonprofit advocacy as bad public policy which is unjust. Research has revealed that suppression of nonprofits' political engagement is more common in developing countries. For example, over the years, China has tightly controlled its grassroots civic organizations through intrusive registration and monitoring processes and tried to regulate INGOs through similar procedures (Ye 2003). NGOs elsewhere in mostly non-Western countries face similar barriers or worse as nonprofit lobbying might be prohibited altogether. Within the United States, the constitutionality of lobbying regulations has been called into question by those interested in preserving freedom of speech and expression. However, in *Reagan v. Taxation with Representation of Washington* (1983), the US Supreme Court upheld the constitutionality of lobbying restrictions on charitable nonprofits.

Considering the agenda bias that is recognized by those who study lobbying and policy, nonprofits' political voices might be a key to preserving the equitable representation of the poor and underserved. According to Baumgartner et al. (2009), the agenda in the US legislature often does not reflect policy priorities of the marginalized but mirrors the preferences of mobilized interest groups. The underrepresentation of certain groups of citizens on the congressional agenda poses a serious challenge for effective governance as the issues that matter to the disadvantaged are largely left out of legislative decision-making, leading to a significant imbalance in public policies. In other words, the underrepresentation on political agendas of marginalized citizens is linked to policy outcomes. Considering these biases against disempowered groups in both policy agendas, and policy outcomes, nonprofit lobbying may be a key to improving democratic governance through bolstering the representation of those with suppressed political voices in the United States and worldwide.

## Methods and Extent of Lobbying Activity

Previous sections provided an overall legal and regulatory context for nonprofit lobbying. This section focuses on reviewing some of the specific methods individual nonprofit organizations adopt to lobby government and scholarly findings as to the extent to which these nonprofits engage in lobbying activities. The literature is relatively limited in these matters, and the review of the scholarly works relies mostly on US-based studies.

Among a few studies published on this topic, Salamon et al. (2008) report from their US-based survey of 311 nonprofit organizations in the fields of human services, economic development, and the arts that charities' involvement in policy advocacy or lobbying is not uncommon. In fact, nearly three-fourths of the responding nonprofits in their survey say they engage in advocacy or lobbying somewhat regularly. When they are asked about their participation in "lobbying" specifically (i.e., the narrow, legal definition of lobbying), more than half of the organizations (59%) indicate that they engage in some form of lobbying. While Salamon et al.'s (2008) report suggests a surprising extent

of lobbying activity by charitable organizations, their findings are at odds with those of other studies that report nonprofit lobbying and come with several caveats. For example, close to 90% of the organizations who lobby spend less than 2% of their budget for lobbying and rarely allocate substantial amounts of staff time for public policy activities. The scant resources nonprofit organizations devote to advocacy or lobbying may explain why their lobbying often takes the form of simply signing a letter or calling elected officials to express their endorsement of or opposition to particular legislation rather than hiring a lobbyist or organizing a public event for grassroots lobbying, which requires a more intensive level of organizational commitment. While these observations are made primarily based on Salamon et al.'s (2008) findings, other studies that broadly collect data in the United States regarding nonprofit advocacy, as well as lobbying activities, find similar tendencies (DeVita et al. 2014).

Salamon et al. (2008) also report that when nonprofits engage in lobbying, their focus tends to be on protecting funding or opposing regulations that directly affect them rather than advocating for broad policy goals as they try to prioritize their efforts toward self-preservation when resources are limited (Salamon et al. 2008). Based on a survey of human service organizations in the United States, Sandfort (2014) makes similar points that nonprofits focus their lobbying on the acquisition and maintenance of government resources. It is important to observe that the studies cited here largely focus their surveys and analyses on human service nonprofit organizations that tend to heavily rely on government for funding. It is reasonable to believe that both the focus and methods of lobbying could be very different for a variety of civic groups and rights-based organizations whose primary missions are to promote the public interest and societal benefits. For example, unlike human service organizations, these groups may pursue direct and indirect lobbying more actively by contacting lawmakers and pressuring them through their member communications in order to advance broader public interest goals.

It should also be noted that the extent of lobbying by nonprofit organizations varies substantially, depending on the level of government they target. Scholars report that nonprofit organizations tend to be much more active in their efforts to interact with lawmakers and influence public policies at the state and local level, as compared to the federal level, because they face less competition from business interest groups, have better access to policymakers, and thus are more successful in lobbying at the lower levels of government (Berry and Arons 2003; Salamon et al. 2008). At the national level, successful nonprofit lobbying is mainly associated with a relatively small group of citizen advocacy organizations whose missions are often related to environmental protection, consumer safety, and various rights-based public interests and societal benefits (Berry 2001). Scholars attribute effective lobbying by these groups to their tenacity and strategic focus in advocacy, superb knowledge and expertise on policy issues, and institutional capacity (Berry 2001).

Despite the well-publicized lobbying success of citizen advocacy groups, their impacts tend to be limited to a few highly salient policy matters. Business firms as well as trade organizations constitute the most dominant lobbying forces for the vast majority of issues brought up at nations' capitols. This is certainly the case in the United States. Many traditional human service agencies that heavily rely on public funding argue that lobbying at any level of government is not part of their typical activities. It is interesting, however, that there are significant differences between H electors (i.e., nonprofits that take the 501-(h) election to be subject to the expenditure test for their lobbying activities) and the other conventional nonprofits who do not elect the H option in terms of the level of knowledge they have about lobbying-related regulations and the extent of actual lobbying activities (Berry and Arons 2003). That is, H electors are much more knowledgeable about government rules regarding participation in public policy and political processes than nonelectors. Likewise, H electors are considerably more actively engaged in lobbying than their counterparts.

## Barriers to Nonprofit Lobbying

Despite the lack of accurate information available to estimate the true scope and extent of lobbying by charities, scholars largely agree that lobbying is, at least on the surface, a shunned activity. In fact, as mentioned earlier, Salamon et al.'s (2008) recent study that reports lobbying engagement by high percentages of the nonprofits responding to their survey is an exception rather than a norm in this field of study. The most common factors contributing to this inactivity are lack of staff time, resources, and skills that nonprofits can leverage (Salamon et al. 2008). While these are practical obstacles, there also seem to be widespread perceptual and cultural barriers that prevent nonprofits from actively injecting themselves into the political process, including by the means of lobbying. Fear of potentially losing current and/or future funding and other privileges they enjoy from government often leads charities to disengage themselves from any involvement in lobbying. Scholars, in general, theorize this phenomenon as "don't-bite-the-hand-that-feeds-you resource dependence" (Chaves et al. 2004, 295) by the nonprofit sector, especially human service nonprofit agencies, and hypothesize that heavy reliance on government for funding will suppress nonprofit advocacy and lobbying against government policies. The worries of funding cuts and other forms of political retaliation are rarely substantiated by empirical evidence, but that does little to alleviate general concerns and fear by nonprofit leaders and managers toward political involvement.

Scholars also observe strong cultural barriers that keep nonprofits from becoming politically engaged. For many nonprofit leaders, politics or lobbying is a dirty word that they do not want to associate themselves with (Berry and Arons 2003). Some executives or board members are deeply ambivalent about the effectiveness of lobbying for advancing missions, partly because they doubt they can exert significant influence on policymakers regarding welfare policies for the underprivileged and the voiceless and partly because they simply are uncertain and fearful of such activities.

## Determinants of Lobbying

Given the limited number of nonprofit organizations that do engage in lobbying, researchers have investigated factors that facilitate overcoming legal apprehension. Research has revealed the role of organizational characteristics such as size, access to information and communication technology, and field of activity (Child and Grønbjerg 2007). Specifically, organizational size is positively associated with lobbying and advocacy activity, suggesting that organizations with higher capacity are more likely to engage in such activities. Likewise, access to information and technology increases the likelihood that a nonprofit organization will engage in advocacy. The fields of activity associated with the highest levels of nonprofit advocacy are environmental, health, and education.

Another organizational characteristic influential in determining political engagement is the mission. More specifically, those organizations with a mission that explicitly seeks social changes are more likely to engage in the policymaking process (Pekkanen et al. 2014). Moreover, if a nonprofit is in a situation where policy restricts its ability to pursue organizational missions, it will be more likely to contact public officials (Nicholson-Crotty 2007). Strategic management has also been identified as an influential factor that affects whether a nonprofit engages in lobbying (Leroux and Goerdel 2009). For instance, participation in collaborative networking increases the likelihood of advocacy activity (Leroux and Goerdel 2009). Lastly, scholars examine whether government funding suppresses or promotes nonprofits' lobbying efforts. Findings are mixed in that some report positive effects (Pekkanen et al. 2014; Chaves et al. 2004), while others find no significant relationship (Child and Grønbjerg 2007).

## Conclusion

In this chapter, we examined the concepts and issues pertaining to nonprofit lobbying. In doing so, we discussed the legal framework

determining the scope of nonprofit lobbying in the United States as well as the extent that nonprofits are engaged in lobbying and the factors that facilitate or hinder such activities. Despite the limited scope of our inquiry on the topic, especially due to our focus on the US example and US-based scholarly works, the review of the current state of nonprofit lobbying provided in this chapter offers a few discernable insights for this field of study. Most notably, our review suggests that nonprofits, especially largely charitable nonprofits whose missions focus on service delivery rather than policy advocacy, are still only reluctant participants in lobbying and political processes. This is a clear contrast from their business counterparts and competitors in public policy marketplaces.

Nonprofits' unwillingness to engage fully and actively in lobbying is not simply the results of legal restrictions. Along with actual legal impediments, both a lack of accurate understanding about the laws and cultural barriers may play significant roles. Interestingly, taking relatively weak or inactive positions in lobbying does not imply that nonprofits are not influential actors in public policy processes, as they find numerous ways to advocate for their causes without being "legally" involved in lobbying activities. This "informal" way of advocating for their social missions and representing the marginalized might be an important means for nonprofits organizations whose activities largely take place in less democratic systems with only limited access to policy and political processes.

There has been a substantial growth in the nonprofit lobbying and advocacy-related literature in recent years. Much of the research focuses on the basics – for example, identifying the nonprofits that lobby, the extent to which nonprofits engage in lobbying, and under what conditions nonprofits are likely to lobby for policy change. Going forward, it will be particularly important for researchers and practitioners to carefully consider the effect of nonprofit lobbying on policy outcomes across different contexts and political systems.

## Lobbying and Social Policy

Stephen Chavez
University of Mississippi, Oxford, MS, USA

### Synonyms

Faction; Lobby-agent; Lobbyist

### Definition

Lobbying: Seek to influence (a politician or public official) on an issue; a number of citizens, whether amounting to a minority or majority of the whole, who are united and actuated by some common impulse of passion, or of interest, adverse to the rights of other citizens, or to the permanent and aggregate interests of the community.

Social Policy: Domestic policies focusing on the human condition, such as education, housing, welfare, and equality.

Direct lobbying: Lobbying that attempts to impact legislation through communication with a member or employee of a legislative body, or with a government official who participates in formulating legislation.

Grass roots lobbying: Lobbying that attempts to impact legislation by attempting to affect the opinion of the public with respect to the legislation and encouraging the audience to take action with respect to the legislation.

### Introduction

Lobbyist can be traced back to as early as the seventeenth century when citizens would gather near the English House of Commons in a large lobby and express their opinions. The term lobby-agent came to U.S. politics in the early nineteenth century. In 1832, the term was shortened to lobbyist and was widely used at the U.S. Capitol. When the constitution was written, the framers considered both the importance and dangers that come with faction. The intent was to construct a government preventing powerful interest groups from imposing their will upon the government. The idea was to prevent these factions from obtaining too much power by having to compete with other factions. Factions then became what is now lobbyists. Lobbying serves as an educational tool and makes it easier for individuals to be heard by gaining power in numbers. Lobbying has become a very useful tool in social policy. It is used to protect individuals against everyday risks. Aside from helping government officials obtain information, lobbying helps citizens gain access to legislatures that without lobbying would be very difficult. Lobbying works to break down complex issues that are important in social policy and makes passing legislation possible ("Political Lobbyist" 2008).

### The Role of Lobbying in Public Policy

Lobbying works to influence public policy at all levels in the USA: federal, state, local. Individuals, interest groups, and even different government agencies typically use each other in efforts to alter public policy positions and public policy outcomes. Lobbying is so important in the process of government that it is protected under the First Amendment of the U.S. Constitution "right to petition the government" and protected under the Federal Regulation of Lobbying Act of 1946 and the Lobbying Act of 1976. Professional lobbyist conduct research and provide information and analysis to legislative bodies, government agencies, and citizens. When balanced with competitive lobbying providing multiple perspectives, informed decisions can be made regarding public policy and its implementation. Critical to the lobby process, however, is integrity and trust. Lobbyists live on their reputations that are built on previous efforts. When integrity and trust

abound, a lobbyist or lobbying organization might be invited to help write the piece of legislation being considered. Given that many state legislatures are not professional in the sense of not having full-time legislators with full-time staff assistance, integrity and trust of lobbyists becomes critical given the extent of reliance upon them (Squire and Moncrief 2015).

Not all citizens are represented in the lobbying process. Poor people and the most vulnerable in society tend not to have as much lobbying support as do citizens and groups with money and resources. Nevertheless, "lobbying provides the main channel through which citizens and organizations can attempt to influence the political process. Allowing citizens to create their own political agendas and to push for them is important in all policy categories but is especially important in the realm of social policy" (Bernhagen 2013).

## Lobbying Regulations

While lobbying is protected under the Lobbying Act of 1946 it is regulated through other legislation (Libby 2012). The Lobbying Act of 1976 links lobbying to the expenditure of money. An organization is viewed as a lobbying entity if and when it spends money on shaping public policy. Money may be spent on staff and resources, as well as on the actual engagement in the policy arena. The Act also determines the amount an organization can spend, with the ceiling being $1 million in direct lobbying and $250,000 for grassroots lobbying efforts.

The Lobbying Act of 1976 also provides exemptions. Key policy activities exempted include: membership communications, testimonies to legislative bodies, discussion of broad social issues, and nonpartisan research (Libby 2012).

Further, the Lobbying Disclosure Act of 1995 determines when a lobbyist must register with the legislative body. While variations exist among state legislatures, the common pattern is as follows: if a lobbyist organization spends more than $11,500 on an activity, and if a staff member is spending 20 percent or more time on that activity, then registration is required (HLOGA 2007).

## Lobbying Strategies

Lobbying is pursued in a variety of ways, depending on money and focus. The tactic will be different depending on the issue and the level of government involved. Lobbying at the federal level requires the personal attention of the lobbyist, but also strategies based on convincing large groups of voters and other lobbying organizations. Lobbying in a small town school board in Mississippi, on the other hand, will require less money but perhaps more of the personal touch that reflects local culture and customs.

Grassroots tactics involve reaching down to the citizens. This may include organizing rallies, and demonstration, or letter writing campaigns. It might also entail the cost of media advertisement. Direct tactics involves the lobbying organization bypassing citizen-based efforts and to focus on persuading members of the legislature and staffers in the bureaucratic agency. Both grassroots and direct tactics are typically mixed in an effort to be effective.

Pat Libby (2012) outlines ten "common elements" or strategies for successful lobbying. These are:

- Identifying the problem that the policy should remedy
- Research the issue to provide information for both grassroots and direct lobbying
- Creating a fact sheet that summaries the research findings
- Branding the issue, or framing the proposed problem and remedy in a marketing fashion
- Target potential supporters
- Build a coalition of supporters
- Develop and disseminate comprehensive information, based on the fact sheet information, to the coalition of supporters
- Launch a media campaign that is based on the location and focus of the policy
- Lobby elected officials
- Monitor the progress of the legislative process

## Major Lobby Associations and Corresponding Targets

Education is a major category within social policy. There is correlation that derives from education policy that is seen to have an effect on other aspects of social policy. All members of society are impacted when education levels are increased and education opportunities are allotted to all. There are many lobbying firms that attempt to impact social policy through education. A few of these national lobbying firms are "Teach for America," "National Education Association," "college board," "American Assn of School Administrators," "EducationCounsel," and even "BGR Group" a firm run by former Mississippi Governor, Haley Barbour. These groups intend to increase the education level and make sure education is more easily accessible. The work can be found all over the spectrum; from low-income schools and districts with the goal to help the schools and increase opportunities of students through education to groups working to advance education through professional employees. From preschool to colleges, interest groups work to influence education on every level in hopes to better the systems and opportunities.

Congressional committees are where all the federal bills that effect policy begin to take shape. Lobbyist looking to influence the education system work in the House with the, "Committee on Education and the Workforce," and in the Senate with, "Health, Education, Labor, and Pensions." These committees break down into smaller subcommittees that discuss legislative issues on a more focused and specialized level. These subcommittees are targets of lobbyist. In the House, the subcommittees are, "Subcommittee on Early Childhood, Elementary, and Secondary Education," and "Subcommittee on Higher Education and Workforce Development." In the Senate, they are "Subcommittee on Children and Families," and "Subcommittee on Employment and Workplace Safety." Lobbyist work with these committees and subcommittees to present information and help influence policy making in every step of legislation.

Lobbyist's ultimate goal is to push their agenda. Therefore, they work with every agent of policy. Lobbyist in education work with the Department of Education for the best odds to influence policy. While there are many different agencies within the Department of Education, some major agencies within that lobbyist would look to target would be, "Office of Elementary and Secondary Education," "National Center for Education Statistics," and "Office of Career, Technical, and Adult Education." Other agencies within the department focus on aspects of immigrant education, special education, federal aid, sexual assault within schools, civil rights, and many more topics within the educational field. There are agencies covering every topic of educational issues. Depending on what exactly the lobbyist is pushing for will determine which agency within the department they will try to work with.

Lobbyist works not only on a national level, but also within the states. In the state of Mississippi, for instance, education lobbyist work with committees within both the House and Senate by advising through meetings, providing information, and helping to write legislation. Mississippi representatives do not work full time, as do members of congress, this is important for lobbyist because they are on tight schedules when it comes to achieving their policy goals. Reaching the subcommittees are important for lobbyist, however, subcommittees in Mississippi are not "standing." The chairman of each committee is responsible for forming subcommittees whenever session is in. Outside of the state capital, lobbyist work with the state's Department of Education. The different agencies within the department that lobbyist targets include "Academic Education," "Career and Technical Education," "Educator Quality," "School Financial Services."

In Mississippi and the other states, lobbying is as important as it is at the national level. It is a complex process involving many different associations and many targets in the legislature and agencies. They involve many different strategies with the goal to help provide information and progress legislation.

## Conclusion: Summary and Prospects for the Twenty-First Century

Lobbying is a very important agent in the legislation process. Through different tactics, lobbyists work to inform and influence the moves and decisions of legislators. The information provided by lobbyists helps the flow of bills under consideration. Lobbying helps to give others a voice. It allows an outlet for all people, not only legislators, passionately legislation of importance. It is an effective means to express opinions and exercise input in a democratic society

The future of lobbying is unclear. Previous administrations have enacted laws and restrictions on lobbying in an effort to make it more ethical and transparent "Revolving door" restrictions prevent members of congress from becoming lobbyists for an extended amount of time once they leave office. This hinders unethical lobbying and helps provide an efficient legislation process.

Yet with a rise in social media, there has been more diversity added to the way information is developed, disseminated, and consumed. Trends show a decline in registered lobbying and an increase in virtual messages to members of legislatures. Traditional lobbying will still exist in ways of fundraising and meetings because connections are what make lobbying effective. This will cause lobbying in the future to combine traditional lobbying skills with the new age tech-savvy ways of communication. Though lobbying will experience change, providing information is still important and the future for lobbying is bright.

# Lobbying in Public Administration

Beverly A. Cigler
Penn State Harrisburg, Middletown, PA, USA

## Synonyms

Big Seven; Intergovernmental lobby; State and local government interest representation

## Introduction

When most people think of interest groups that lobby government they usually focus on private sector organizations. It is less known that states and their local governments also lobby a great deal within the American political system. Most attention is given to organizations representing state and local government officials that work to achieve consensus among their members on issues important to their member governments. They then lobby another level of government to achieve their policy preferences. Legislators and legislatures are the primary targets of the lobbying and, thus, the focus here. The groups discussed sometimes also lobby executive branch agencies, however. This essay focuses on government-to-government lobbying, not all lobbying in public administration, which is much too broad of a topic for a short essay.

Intergovernmental lobbying also includes single governments such as a state, city, county, or special-purpose governments – school districts, port authorities, water and sewer systems, universities, and many others. All states and many large municipalities and counties have lobbying offices in Washington, DC, generally located in the Hall of

the States, conveniently physically near Capitol Hill. The special-purpose governments can have national, state, and local representation and some very large municipalities, counties, universities, and specific special-purpose governments also have offices in state capitals that employ lobbyists.

The most studied aspects of government-to-government lobbying are activities performed by well-established national membership organizations that represent governors, mayors, county executives and commissioners, state legislators, and other elected officials at the state and local levels. The component of the intergovernmental lobby that is most studied is often referred to as the "Big Seven." It consists of the National Governors Association (NGA), National Conference of State Legislatures (NCSL), Council of State Governments (CSG), National League of Cities (NLC), US Conference of Mayors (USCM), National Association of Counties (NACo), and the International City/County Management Association (ICMA). ICMA, however, does not formally lobby; instead, it represents nonelected professionals such as municipal and city managers as well as county managers. CSG also does not formally lobby and is unique in that it represents officials from all branches of government – executive, legislative, and judicial. In addition, CSG has dozens of affiliate organizations tied to functional policy areas that focus on specific policy concerns related to their mission. The "Big Seven" is, thus, composed of five national organizations that lobby the national government, collectively known as SLIG's – state and local interest groups – and often supplemented by working closely with the ICMA and CSG, which do not lobby. The collaboration with ICMA and CSG enhances the credibility of the organizations representing elected officials as partisanship and ideological positions are lessened. The NLC's membership consists primarily of small and moderately sized municipalities and the USCM represents the interests of the nation's largest cities.

Cammisa (1995) explains that intergovernmental lobby members' interests are spatial and programmatic. Haider (1974) explains that spatial concerns traditionally are about interactions between one level of government that has funding control and program implementation authority within a geographical entity and other governments that receive funding. Recipient governments advocate for various funding amounts and desire flexibility and less regulation from the level of government providing the funding. When the Big Seven is internally unified and can work effectively across other state and local groups, a united front can interact with Congress, but such unity is very difficult to achieve in our increasingly polarized society. Differences in partisanship, ideology, and personality, along with regional rivalries and demographic realities, make consensus difficult and achieving unity on many key issues is often out of reach (Cigler 1995, 2012).

## Not Just Special Interests

Overall, the generalist organizations attempt to show that they are not "just another special interest" within the political system; instead, they claim to work in pursuit of the public interest (Cigler 1995, 2012). In fact, these groups often label themselves as public interest groups (PIGs) as they pursue benefits not limited solely to their members. Other observers, including some government officials, however, sometimes use the acronym PIG in a pejorative manner. Despite this unflattering characterization of the generalist organizations, it is accurate to describe their work as aimed at a wide variety of programs that benefit all or much of society and not just their dues-paying members. The groups share interest in similar policy concerns and operate within the interest group sector that takes stands on broad issues related to health, welfare, and education; economic development, job creation, workforce development, trade, and cultural affairs; consumer protection; agriculture, and rural development; energy, the environment, and natural resources; banking, insurance, and financial services; budget and taxation; homeland security and emergency management; telecommunications and information technology; transportation and infrastructure; criminal justice and public safety; and civil rights, among other policy concerns.

The policy reach of these groups is very broad, extending beyond domestic issues to those having components of both domestic and international policy. State governments usually have foreign trade offices that represent and promote their economic interests abroad. States engage in international issues in ways previously not envisioned as they build relationships beyond economic trade promotion, cultural exchanges, and tourism. Activities include the broad climate change agenda, human rights issues, economic sanctions and divestment policies, global finance issues, drug policy and other criminal justice issues, food safety, and much more. Again, the intergovernmental associations play a coordinative role and individual cities and states are active in the international arena.

Obviously, consensus on any of the broad range of domestic and international issues is difficult to forge, but the organizations produce a wealth of information and often research useful to policymakers, the general public, and other organizations. Again, they do not just serve their members who may never agree to a single organizational position on a particular issue. Instead, their activities go beyond the traditional sphere covered by a typical interest group.

On important issues where consensus cannot be reached within a Big Seven organization, or across the Big Seven organizations, individual states, cities, and counties often rely on their own Washington offices for advocacy. This often occurs for issues specific to a state for which the NGA cannot be expected to allocate substantial time to or to take a stance, for example. A governor generally takes the lead in opening a state office. Jensen (2016) found three key benefits of individual state offices: procurement of federal grant funding or success in securing favorable funding formulas for a federal grant program; help in achieving a policy goal, often through a waiver that allows the state more flexibility in administering a federal program or regulation; and political benefits such as increased visibility and prestige for a governor.

The local government organizations within the Big Seven also have lobby organizations at the state level. For example, the NLC, which represents small and medium-sized municipalities, has state affiliate organizations called municipal leagues. Counties have state-based county associations. Although they are not formal affiliates of NACo (Cigler 1994), the state county associations cooperate with NACo. Whether formal affiliates of a national association or independent state-level organizations, the state-based organizations lobby state legislatures and seek a "seat at the table" in legislative and executive branch actions. ICMA also has affiliate organizations in the states, which, like the ICMA, do not lobby, but help build the managerial capacity of municipal and county managers. In fact, ICMA works internationally to build managerial excellence. State-level ICMA affiliates are often housed within a state-based municipal organization that provides administrative services to the operation by serving as its secretariat.

All of the organizations within the intergovernmental lobby do much more than lobby. In fact, they are what Salisbury would call "service organizations" that do "interest representation" (Salisbury 1984). The intergovernmental organizations do provide some selective benefits to their members such as newsletters and some research products. However, rather than serving as "just another special interest group," they promote efficiency and effectiveness of government programs and attempt to facilitate intergovernmental partnerships at every level that are important especially to policy formulation and implementation. All perform research and build collaborative relationships among their members, as well as provide a host of services for them. The associations monitor and report on legislative and executive actions, develop and analyze policies, communicate in multiple formats with policymakers, and mobilize political support. The groups vary in their levels of sophistication, but all are service organizations for their dues-paying members. In addition to their Washington, DC offices, the NCSL and CSG have offices in Denver and Lexington, Kentucky, respectively, and the CSG also has regional offices. Many of the intergovernmental organizations have offices in the Hall of the States, which facilitates contact with each other and with members of Congress who represent their constituent governmental units.

## Government Growth Linked to Intergovernmental Lobbying

The growth of government programs and the proliferation of intergovernmental groups are linked. The generalist associations are a twentieth-century phenomenon, with formation and/or expansion occurring primarily during the New Deal era in the 1930s and in the 1960s and 1970s when Great Society programs were initiated to fight poverty and government programs required cooperation among and between governments at all levels. The earliest organizations grew out of the Good Government movement associated with confronting corruption and urban bosses as society urbanized and governments professionalized. The NGA was formed in 1908, ICMA in 1914, the CSG in 1933, and NCSL in 1948. NLC emerged in 1924, USCM in 1933, and NACo in 1936. The three local government generalist organizations within the Big Seven – NLC, USCM, and NACo – are still often called the urban lobby. The "C" in ICMA, which primarily promotes professionalism in government, originally stood only for cities but later came to designate cities and counties as the roles and responsibilities of counties expanded.

It is important to note that the intergovernmental lobby resembles other interest groups in its use of the courts to deal with policy issues of greatest concern. For example, the Big Seven has a State and Local Legal Center that works with its member organizations on filing amicus curiae briefs before the US Supreme Court to promote their policy initiatives, especially relating to federalism. One specialist group, especially, the National Association of State Attorneys General, is housed in Washington, DC, and is a powerful force in American litigation, with many states joining together for important lawsuits. An example of their success is states' ability to charge sales taxes on online purchases by consumers.

The Big Seven also has strong competitors. For example, conservatives created the American Legislative Exchange (ALEC) in 1973. Its founders argued that the NCSL was too liberal, despite its professed allegiance to nonpartisanship since entire legislatures are NCSL members. The founder of ALEC also cofounded the leading national conservative think tank, the Heritage Foundation, also in 1973. ALEC's members comprise a large number of state legislators as individual members, many in leadership positions. ALEC, Heritage, and the state affiliates of Heritage offer a well-coordinated network on a broad set of conservative issues and are known for drafting model laws that are proposed in state legislatures nationwide. Key issues include opposition to taxes and support for taxpayer bill of rights (TABOR) laws and opposition to civil rights laws, abortion rights, gun control, and many consumer, labor, and environmental laws. Liberal and progressive groups have attempted to form in response to ALEC, but none of the efforts have resulted in success matching the ALEC-Heritage-Heritage Affiliates reach.

## Specialist Organizations

The overall intergovernmental lobby is far larger than the generalist organizations that represent many state or local governments either at the national or state level. Thousands of specialist organizations also lobby for one or more issues, generally representing nonelected officials at both the national and state levels. Examples of specialists are the state attorney generals mentioned earlier, state highway and transportation officials, budgeting officials, and officials from highway, housing, and other substantive areas. Radin (1990) found that California, for example, had about 80 officials and agencies with Washington representation. Compared to the generalist organizations, there has been less research on the specialist or functional organizations (Berechman 2018; Marbach and Leckrone 2002) such as the National Association of State Budget Officers or the American Association of State Highway and Transportation Officials (AASHTO).

As government programs grew in complexity, with greater spending and regulations, the specialist organizations have increased in the significance of their impact. Changes in policymaking and service delivery systems expanded

opportunities for nearly every type of administrative speciality to influence legislation and programs. Congress itself is organized in terms of functional policy areas and the specialist organizations can provide highly detailed information to committees and individual legislators, as well as executive branch agencies. As such, staff of the specialist associations comprised of state and local officials often have relatively easier access than generalist associations to policymaking arenas.

## Intergovernmental Interest Representation Typology

Cigler (2012) presented a revised typology of her earlier (Cigler 1995) depiction of the gamut of state and local interest representation in the American political system, which is even broader than discussed thus far in this essay. The typology includes the Big Seven and state-level generalist organizations, the single jurisdictional representation of state and local governments, and specialist organizations promoting functional interests. The typology includes additional components: new and resurgent generalist associations, public interest organizations, and an informational infrastructure. Each is discussed briefly below.

A number of generalist government organizations were established in the 1980s and 1990s or created earlier and grew stronger during that period – all much later than the founding of the Big Seven organizations. Some of the younger generalist organizations think that the term Big Seven is outdated and that there is a Big Eight or Big Nine or more. Examples of the newer generalist organizations are the National Association of Towns and Townships (NATaT) and the National Association of Regional Councils (NARC).

Just as the generalist organizations comprising the Big Seven emerged as "products of the times," so did these newer generalist organizations. Most people live in large cities and counties, but small local jurisdictions are the most numerous governmental units. NATaT, founded in the 1960s, saw a resurgence in the 1980s during the Reagan administration as a largely conservative group. Strong membership services and ties to township associations within several states helped NATaT achieve policy successes and expand its role.

NARC gained in importance because geographical organization of metropolitan areas does not necessarily match the nature of policy problems, which spill over jurisdictional boundaries. Regional organizations can be an alternative to or a supplement for the established generalist associations representing spatially defined entities such as cities in dealing with functional policy concerns.

The National Civic League, founded in 1894 as part of the "good government" reform movement, then called the National Municipal League, is an example of a resurgent organization. There are several thousand nonprofits promoting citizen engagement in issues of governance in their communities. Such groups sponsor conferences, networking, and publications by recruiting dues-paying members. Thousands of organizations, especially those focused on urban and environmental topics, have emerged. Depending on the policy area, they often work with the major intergovernmental groups, although there may be disagreements on ideology and goals.

When there are perceived threats to poverty, child welfare, civil rights, environmental, and other sectors the rate of group formation increases. Once again, these organizations have competition, especially from conservatives and right-wing think tanks opposed to what they perceive as taxpayer-funded lobbying since their work, in part, is drawn from funds from programs they support. The public interest organizations, however, claim to promote key values in the political system: responsiveness, representativeness, accountability, equity, and effectiveness, not just ideological positions on policies.

Another component of Cigler's state and local interest representation typology (2012) is the array of national- and state-level units that facilitate understanding of intergovernmental issues through research and data collection in light of a longstanding decline in the national government's institutional capacity for analyzing intergovernmental issues, especially since the early 1980s. Many of these units are within government, such

as the Office of Management and Budget (OMB), the Government Accountability Office (GAO), and congressional subcommittees. Similar units exist in states and the key offices for increasing analytical strength, such as the former Advisory Commission on Intergovernmental Relations (ACIR), were either eliminated or saw substantial diminishment of financial and other support. The decline of government's analytical ability to understand intergovernmental issues have lessened the capabilities of the national and state intergovernmental associations as well as the access they had to such resources previously.

## Conclusion

The relative success of the components of the intergovernmental lobby within public administration depends on the issue and many organizational factors such as size, resources, cohesion, and leadership, among many other factors. After decades of little research, recent years have seen a significant surge of interest and research on the intergovernmental lobby. Much more is known about the Big Seven than specialist organizations. Relatively little research has focused on state-level organizations until recently (Payson 2017, 2020a, b). Jensen (2019) has recent provided a review of the utility of research findings on intergovernmental lobbying. These recent works are recommended as initial reading for those interested in the topic of government-to-government lobbying.

# Local Autonomy in South Korea

Chad David Anderson
Department of Public Administration,
Incheon National University,
Incheon, Republic of Korea

## Synonyms

Decentralization; Local government; Local governance

## Introduction

National governments are presented with a range of choices regarding administrative organization

according to geographical area that range from highly centralized to highly decentralized. The main trade-offs are between clear responsibility and less duplication of services in centralized systems and greater flexibility and more local accountability. These choices have important consequences for the nature of power, politics, local government functions, and resources (Peters 2001: 151–152). Decentralization, also known as local autonomy, is the process where authority is redistributed from centralized authority to local authority (Bahl 2008). The Republic of Korea has increased local autonomy along with democratization, giving local government more to do, in addition to more budgetary discretion. The current level of local autonomy is based on long-standing efforts since liberation in 1945 in favor of independent elected government that came to fruition as part of the establishment and implementation of the current representative democracy.

The Republic of Korea is a unitary state with a strong national government that delegates authority to various local divisions and subdivisions of the country. The current system of South Korean local autonomy should be understood in the context of what immediately preceded it: the direct control of regional and local government administration by the national government. Even with local autonomy, "national governments still maintain centralized power over local government through supervision of delegated functions central government branch offices, and financial subsidies" (Kim 1997b: 254).

## Origins and History of Local Autonomy

This current system of local autonomy is relatively recent, based on the Constitution of 1988 that established the current system of government. However, the roots of local autonomy date back to the Local Autonomy Act of 1949, which was passed shortly after the 1948 founding of the Republic of Korea. Modern Korean administrative divisions in both the North and the South are based on the eight provinces (Pyeongan (P'yŏngan), Hamgyeong (Hamgyŏng), Hwanghae, Gyeonggi (Kyŏnggi), Gangwon (Kangwŏn), Chungcheong (Ch'ungch'ŏng), Gyeongsang (Kyŏngsang), and Jeolla (Chŏlla)) established during the Joseon (Chosŏn/Chosun) Era (1392–1897) (Nahm 1999: 51) (There are a number of different systems of transliterating Korean. This chapter uses the Revised Romanization adopted by the Korean government since 2000 with common English spellings for names of Koreans, as recommended by the Revised Romanization. When this results in a difference in spelling with a source or with common English usage, the other spelling is given in parentheses.). These have been maintained in modified form through Japanese occupation, national division, and all of the subsequent six South Korean republics since the founding of the first in 1948 (see Fig. 1).

The level of subnational decentralization is related to the organization of the entire political system (Peters 2001: 151). During the 500 years of the Joseon (Chosŏn/Chosun) era in Korea prior

**Local Autonomy in South Korea, Fig. 1** The historical provinces of Korea

L

to the twentieth century, strong central authority based on the king and his government in the capital was both the practical reality and the ethical ideal. The scholars staffing and advising the bureaucracy both from the idealistic neo-Confucians and their more realistic legalist critics held centralized authority to be a virtue in Joseon (Chosŏn/Chosun). Local affairs were run by authorities appointed by the crown. These local authorities were further monitored by inspectors from the capital (Kim 1997a). However, centralized power was not absolute but was checked by both the scholarly bureaucrats and scholarly nobles outside of government. The Confucian concept of self-rule by virtue found expression in local affairs, as through *yuhyangso* (office of local self-rule), *hyangyak* (self-help societies), and even the system of *gye* (a collective investment savings system with a rotating payout) (Ahn 2005: 25). However, these local autonomous institutions were more "moral than political" in function (Cho 1993: 229). There were also remote areas too inaccessible to be under direct royal supervision where local elites ran their own affairs in line with what they understood to be state priorities.

Close supervision of local affairs by the central government is one common trait of centralized rule (Peters 2001: 151). This provided a common thread from the authoritarian system under the monarchy, through Japanese rule, US military occupation, and postwar authoritarian rule (Kim 1997a). The usurpation of state authority under Japanese occupation continued this general system of direct control of local affairs by authorities appointed by the Japanese Governor-General. It also ended the decentralizing trends in Joseon, further concentrating state power. The major innovation took place during the period when Japanese occupation was based on the ostensible premise of preparing Korea for self-rule when the Japanese also operated local advisory councils for the purpose of assisting Japanese occupation (Kim 1997a: 84).

Following liberation and national division in 1945, the US Military Government in Korea largely continued the Japanese system, although purged of Japanese, with plans for local self-rule under the provisional government ultimately postponed until the creation of the Republic of Korea in 1948. In spite of any plans to the contrary, the military nature of the occupation did mean that centralized authority was actually intensified during this time (Kim 1997a: 87).

The Local Autonomy Act of 1949 then defined the initial system of local governance under the First Republic. However, implementation of local self-governance was again postponed, this time due to political conflict. President Syngman Rhee (Lee Seung-man) pressed for implementation in 1952 during the Korean War as part of plans to extend his rule under the rationale that consistent administration was necessary for implementing local self-government though done to enhance the power of the central government in Seoul (Ahn 2005: 26). The elections for the new local councils were held during the war (Choi 2016: 135).

After Rhee (Lee) was forced from power in 1960, the Second Republic prepared and enacted full autonomy as part of a broad plan for decentralization. However, local autonomy was overruled and abolished when Park Chung-hee (Park Jeong-hui) overthrew the government in a military coup. The Park regime used the primacy of national security and an emphasis on economic growth for national development to justify suppressing any moves toward decentralization or local autonomy. Under President Park, the Ministry of Home Affairs exercised overall control of local affairs through elite bureaucrats dispatched from Seoul and answerable to the Ministry (Kim 1997a). The intent was to maintain close supervision of local affairs by the central government under the assumption that anything less than tight control would lead to democratizing pressures. However, it is common that this level of control often results in the central government representatives overseeing local affairs acting as mediators between national and local interests or even to their co-optation by local interests where they then represent local desires to the national government (Peters 2001: 151). The system of national appointment

of local officials was to continue for about 30 years through the Third, Fourth, and Fifth Republics.

Decentralization has been used internationally as a tactic for dealing with ethnic differences (Peters 2001: 152), which was not a concern in mono-ethnic Korea. However, Korea was increasingly divided along regional lines, and uneven development was also an increasing problem. In addition, the opposition came to see local autonomy as part of the pro-democracy movement. President Chun Doo-hwan (Jeon Du-hwan) faced increasing popular protest from the democracy movement with citizen demands for restoring local autonomy and the direct election of the president. President Chun (Jeon) agreed to this agenda in 1987, and his fellow former general Roh Tae-woo (Roh Tae-u) was elected in December of that year (Song 2009; Bae and Kim 2013). The Local Autonomy Act was then revised and redrafted in 1988. On the other hand, the actual implementation of local autonomy was delayed for years until the first local council elections were held in 1991. The first elections for local executives were not held until 1995 (Ahn 2005: 27). The process of establishing Korean autonomy was largely controlled by negotiations among actors at the center of Korean politics, in particular between the authoritarian government and the opposition parties (Song 2009; Kim 2010; Bae and Kim 2013).

## Structure of Local Autonomy

South Korea is divided beneath the unitary central government into two levels of autonomous government and a lower level of purely administrative divisions (see Fig. 2). Regional government represents the highest level of autonomous government authority under the central government and includes 17 autonomous governmental entities, including nine provinces and eight cities independent of adjacent or surrounding provinces. The provinces include eight regular provinces descended from those established during the Joseon (Chosŏn/Chosun) Dynasty-North Chungcheong (Ch'ungch'ŏng), South Chungcheong (Ch'ungch'ŏng), Gangwon (Kangwŏn), Gyeonggi (Kyŏnggi), North Gyeongsang (Kyŏngsang), South Gyeongsang (Kyŏngsang), North Jeolla (Chŏlla), and South Jeolla (Chŏlla), as well as the island of Jeju (Cheju), a special self-governing province. The eight cities include the special city of Seoul, the special self-governing Sejong City, and the six metropolitan cities of Busan (Pusan), Daegu (Taegu), Daejeon (Taejŏn), Gwangju (Kwangju), Incheon (Inchŏn), and Ulsan (see Fig. 3 and Table 1) ("Metropolitan city" does not refer to metropolitan areas but is the translation for the Korean language designation *gwangyeoksi* for the class of consolidated autonomous cities at the level of regional government. For example, Incheon Metropolitan City falls within the Seoul

| City name | Designation | Population (2017) |
|---|---|---|
| Seoul | Special city | 9,741,871 |
| Sejong | Special self-governing city | 276,589 |
| Busan (Pusan) | Metropolitan city | 3,416,918 |
| Daegu (Taegu) | Metropolitan city | 2,453,041 |
| Daejeon (Taejeon) | Metropolitan city | 1,525,849 |
| Gwangju (Kwangju) | Metropolitan city | 1,496,172 |
| Incheon (Inchŏn) | Metropolitan city | 2,925,967 |
| Ulsan | Metropolitan city | 1,157,077 |
| Province name | | |
| North Chungcheong (Ch'ungch'ŏng) | Province | 1,611,009 |
| South Chungcheong (Ch'ungch'ŏng) | Province | 2,162,426 |
| Gangwon (Kangwŏn) | Province | 1,521,386 |
| Gyeonggi (Kyŏnggi) | Province | 12,851,601 |
| North Gyeongsang (Kyŏngsang) | Province | 2,677,058 |
| South Gyeongsang (Kyŏngsang) | Province | 3,345,293 |
| North Jeolla (Chŏlla) | Province | 1,826,174 |
| South Jeolla (Chŏlla) | Province | 1,792,319 |
| Jeju (Cheju) | Self-governing province | 641,757 |

metropolitan area but has its own separate autonomous status.).

The next level of autonomous government is made up of municipalities underneath the provinces and special and metropolitan cities. The provinces are divided into urban cities (*si*) and rural counties (*gun*), while the metropolitan and special cities are divided into urban districts (*gu*) and rural counties (*gun*). These provincial cities, urban districts, and counties make up a third level of government, all entitled to self-government under the Local Autonomy Act.

There are further subdivisions that exist at an administrative level to implement higher legal and administrative acts within their jurisdiction. Urban districts (*gu*) are divided into neighborhoods (*dong*). Counties (*gun*) in provinces and metropolitan cities are divided into towns (*eup*) and rural townships (*myeon*). Provincial cities have nonautonomous districts (*gu*) as well as neighborhoods (*dong*), towns (*eup*), and townships (*myeon*) (see Fig. 2). (The English terms in use vary. *Gu* may be known as districts, wards, and even boroughs. *Dong* may be called neighborhoods, villages, wards, and districts. *Myeon* may be called town, township, or community. *Gun* is generally called a county.)

The three special regional entities have a special structure. Seoul is purely urban, with only districts (*gu*) and neighborhoods (*dong*). Sejong City was recently created to serve as the new administrative capital from a county. The city has no districts (*gu*), only two neighborhoods (*dong*), one town (*eup*), and nine townships (*myeon*). It is also still smaller in population than many provincial cities. Jeju has 2 cities, no counties, 4 towns (*eup*), 3 townships (*myeon*), and 19 neighborhoods (*dong*).

While municipalities may be merged or split, their self-governing status means a local referendum is required and the residents and the governing local council and government are required to consider the public interest as well as the social, cultural, and economic interests of residents when drawing up proposed changes. Residents and the governing local council have the power to decide the boundaries and the total quantity of municipalities within a regional jurisdiction. Unlike the international pattern, which has been moving toward consolidation (Peters 2001: 153), the trend in Korea has been toward an increasing number of most local autonomous government entities. Right after the first round of elections for local executives in 1995, there were 15 regional governments (provinces and metropolitan and special cities) with Ulsan added in 1997 and Sejong in 2012 for the present 17, 68 provincial cities increased to 75 plus two administrative cities, and 74 urban districts increased to 69 autonomous and 35 administrative. Only the 102 rural counties decreased to 82, following the decline in rural populations (Kim 1997b: 238; Choi 2016: 138).

The main entities of both the regional (provincial/metropolitan) and municipal (city/district/county) levels of government are the local council and the local executive (governor for the provinces, supervisor for the counties, and mayor elsewhere). (The Korean term for governor is *jisa*, county supervisor is *gunsu*, and mayor adds -jang to the name of the entity, i.e., *sijang*, *gucheongjang*, *dongjang*, *eupjang*, and *myeonjang*.) There is no legal differentiation among different types of local government operating at the same level under the Constitution and the Local Autonomy Act, except that governments with a population greater than 500,000 incur extra administrative burdens. In addition, the three special entities (Seoul, Sejong City, and Jeju (Cheju)) are governed by special laws that set them apart from other regional governments (Choi 2016: 138).

Accountability to local voters is a critical feature of local autonomy (Bahl 2008: 6). As mentioned above, the local councils were elected first, in 1991, and then both council members and local executives were elected in 1995 (Ahn 2005: 27). Return to local elections had been a key demand of the democracy movement in the 1980s and was likewise supported by the elected members in the opposition to President Chun (Jeon). The transition to local elections was heavily contested and debated in the national government. President Chun's (Jeon's) successor, Roh Tae-woo (Roh Tae-u), a fellow former general and member of the same party, worked to slow down

implementation of local elections, while the opposition parties pushed for faster implementation. President Roh tried to delay elections indefinitely but faced a crisis in 1991. The government and the opposition compromised to allow immediate election of councils, with the election of local executives in 1995, after Roh's term was over (Ahn 2005: 27–28; Bae and Kim 2013).

Local councils are elected for both the regional and municipal level local governments every 4 years. Representation is on the basis of population, so the number of council members elected increases or decreases with the population. Election was initially for single-member districts, but the elections have been for proportional multimember districts since 2006 (Park 2006: 17). Local executives are also chosen every 4 years, at the same time as local councils. The number of regional executives has increased with the addition of Ulsan and Sejong City. The number of municipal executives has decreased slightly on the other hand, due to consolidation in rural municipal counties declining in population (Choi 2016).

The local councils were established first, in advance of independent elected executives, and act as the representative body as well as the highest authority for a local government in the realm of autonomous functions (Park 2006; Choi 2016). For example, the council has the authority to pass ordinances, set the draft budget, and to perform other tasks no other body is explicitly assigned by law. The size of a council is based on local population. Local council members are elected every 4 years by a plurality of local citizens for seats, with extra seats assigned on the basis of proportional representation. There was an expectation that the institution of local legislative authority would increase democracy in Korea (Ahn 2005: 27–28). However, local councils tend to lack policy expertise and the resources to enact detailed policy reflecting the people's will, so the local bureaucracy has tended to be more active in bringing forward proposals (Park 2006: 19).

The elected local executive is also chosen by a plurality of local voters every 4 years. The local executive is chief of the local administration and local government employees, manages the budget, and manages and maintains local property (Park 2006; Choi 2016). The executive may also table motions and give instructions. The executive is responsible to the local council in its area of authority and to the central government for carrying out tasks delegated by it. The local executive may be dismissed by the court for illegal actions and may also be recalled by citizens. However, the executive has been the focus of politics and the exercise of power. The mayor represents a broader geographical area than individual council members. In addition to this, control over the budget, the bureaucracy, and appointments gives the local executive a number of advantages that has given them the ability to dominate local politics (Park 2006: 20). In spite of the famous example of Seoul Mayor Oh Se-hoon (O Sehun) quarrelling with an opposition council, the experience of executive-council relations has been less contentious (Lee and Anderson 2015). The first decade of local autonomy saw a regular pattern of deference to local executive authority, with close to 90% of executive-initiated ordinances being passed across the nation in the fourth and fifth local council sessions across the nation (Ahn 2005: 31; Park 2006: 19–20).

## Functions

Central governments around the world generally use subnational governments to implement national policy priorities (Peters 2001: 152). Autonomous local government in Korea is given power to address responsibilities delegated by the central government as well as to deal with issues that only concern the local jurisdiction. The first set of issues is the delegated responsibilities, and the latter represent the autonomous responsibilities. The division in number of actual functions between the two is close to 1:1, with delegated responsibilities making up about 48% of the total and the autonomous responsibilities accounting for the other 52%. The central government, however, still accounts for three-quarters of all government functions (Kim 1997b: 239).

The Local Autonomy Act specifies the functions local government must perform. As part of their local autonomy, local governments are given little direction as to how to carry out autonomous functions. On the other hand, the central government provides instructions for carrying out delegated tasks, and the instructions may be very specific.

Local authorities may be involved in any matter falling into its local area except for diplomacy and national security and defense, which are the exclusive responsibility of the central government. Specifically, the Constitution calls for local authorities to attend to the welfare of local residents and protect their property (Choi 2016: 135). In addition, they are to enact ordinances and regulations as necessary to meet responsibilities as delegated by the national government and may also do so as they choose within the realm of autonomous responsibilities. The areas of "exclusive or preponderant common interest of local residents" represent the main basis for local self-government autonomous and independent of higher authority (Choi 2016: 137).

The Local Autonomy Act also differentiates between different autonomous duties by level, including a detailed listing of possible local functions. This includes selection of local personnel, local development and economic management, local welfare, and local planning. In practice, these things include social welfare provision, transportation, waste collection, libraries, cultural and sports facilities, health facilities, and sewage and environmental maintenance, among others. Many of the delegated functions, like registering residents and maintaining data for election rolls, involve areas of shared concern across governmental levels.

Decentralized systems around the world do not tend to provide many resources or ensure uniformity of services across different local governments (Peters 2001: 152). However, the Korean central government exercises a number of controls over local governments. Though local government is autonomous when carrying out autonomous functions, it reports to the governing national ministry when exercising delegated functions. Furthermore, apparent autonomy is attenuated due to the great need for intergovernmental cooperation. This happens within a level as when Gyeonggi (Kyŏnggi) Province, Incheon, and Seoul cooperate on issues affecting the capital region such as shared resource management and shared transportation infrastructure. It happens across levels as municipalities and regional governments, theoretically independent of each other, regularly consult and cooperate regarding anything that could impact the other. As anything a metropolitan does regarding urban development, for example, will affect the districts (*gu*) inside of the city, there is substantial cooperation on a wide range of issues.

In addition to direct supervision of delegated functions, the Local Autonomy Act also provides for the central government to exercise further control over the autonomous levels of government through a system of local supervision. The purpose of supervision is to check that local governments are operating in accordance with the law, and the supervisory authority has the power to stop actions or ordinances that are against the law. In addition, the National Assembly conducts regular annual inspections that may target local government either through examination of central government bodies to which local government is responsible or through enforcement of anti-corruption measures (Ahn 2005: 52; Choi 2016: 144).

## Resources

Fiscal decentralization has been identified as "the empowerment of people by the empowerment of their local governments" (Bahl 2008: 4). One issue that has been raised since the implementation of local autonomy is the issue of finances. The range of fiscal resources varies greatly among governments, with some governments having very little independence. Of course, Seoul, by its very size and special status, enjoys substantial resources and can accomplish a great deal with its resources that cannot be done by other local governments (Lee and Anderson 2016). There has been some effort made to give local governments more resources by transferring

**Local Autonomy in South Korea, Table 2** Provinces and metropolitan cities ranked by proportion of own-source revenue. (Source: MOIS 2019)

| City name | Designation | Fiscal autonomy (2018) (%) |
|---|---|---|
| Seoul | Special city | 83.80 |
| Sejong | Special self-governing city | 67.78 |
| Gyeonggi (Kyŏnggi) | Province | 61.64 |
| Incheon (Inchŏn) | Metropolitan city | 61.26 |
| Ulsan | Metropolitan city | 54.69 |
| Busan (Pusan) | Metropolitan city | 51.69 |
| Daegu (Taegu) | Metropolitan city | 48.40 |
| Daejeon (Taejeon) | Metropolitan city | 44.65 |
| Gwangju (Kwangju) | Metropolitan city | 44.37 |
| Jeju (Cheju) | Self-governing province | 43.55 |
| South Gyeongsang (Kyŏngsang) | Province | 36.63 |
| South Chungcheong (Ch'ungch'ŏng) | Province | 33.61 |
| North Chungcheong (Ch'ungch'ŏng) | Province | 32.43 |
| Gangwon (Kangwŏn) | Province | 27.52 |
| North Gyeongsang (Kyŏngsang) | Province | 27.47 |
| North Jeolla (Chŏlla) | Province | 24.51 |
| South Jeolla (Chŏlla) | Province | 21.41 |

taxes from the central government to the local governments as well as through subsidies and grants. The actual level of fiscal autonomy in general has been estimated to be about 90% of the OECD average (Choi 2016: 149–150). Table 2 shows the level of fiscal autonomy for all of the provinces and metropolitan cities.

However, the central government has maintained the strongest taxes for itself. The national government receives the proceeds from the corporate income tax, individual income tax, and the value-added tax (VAT), among others. Provinces have the real estate acquisition tax, the registration tax, and licensing fees, among others. Provincial cities and counties have the resident's tax, the property tax, the city planning tax, and the automobile tax. Metropolitan cities and their urban entities have the same list of local taxes, though the mix is different, with the urban districts (*gu*) depending on property taxes, licenses, and business registrations, while the metropolitan governments have the others (Kim and Kim 2003). Local governments do not have a great degree of flexibility but can make use of user fees as well, and urban districts (*gu*) sell volume-based trash bags to raise funds but also manage solid and food waste. Overall, intergovernmental transfers (mostly from higher government sources) account for 60% of local government funding, local taxes provide about 32%, while user fees, sales, rents, and other sources make up the other 8% (Kim and Kim 2003; Choi 2016: 146).

In spite of roughly half of tasks being delegated, there is greater discretion for expenditures than for revenues as the central government does not provide strict budget guidelines. This discretion has led to some issues. These include a lack of planning so that priorities may rapidly change with a change of administration. There has been increasing public demand for welfare, so expenditures have grown significantly over time, especially with the institution of free school lunches in some jurisdictions since 2010. Overall there has also been a stress on political rationality over economic rationality, with pet projects and prestige spending sometimes going forward even when not economically justifiable. On the other hand, entitlements and matching fund requirements

have the effect of limiting discretion somewhat (Kim and Kim 2003).

Actual expenditures across different types of governments in recent years have been divided between education (43.5%), general services (26%), economic affairs (15%), environment (4%), public order and safety (4%), culture (2.5%), health (2%), social protection (1.5%), and housing (1.5%) (Choi 2016: 148). Naturally, there is significant variance according to the type and size and resources of various governments. In addition, there has been some use of spending assigned in one area to accomplish other purposes. For example, culture spending seems to have been used to provide welfare, particularly under more liberal politicians, while culture has also been used for development purposes under more conservative politicians (Lee and Anderson 2015).

The discrepancy between the low level of discretion in raising revenues and the great discretion in expenditures means that there has been a temptation to spend. This has led to debt crises in some jurisdictions, particularly at the regional level where residents may look to Seoul for what they think is possible while local officials have more modest resources available (Kim and Kim 2003). The 2010 election may have been tipped in Incheon (Inchŏn) when the challenger publicly revealed at a debate the actual amount of the city's debt to the shock of many members of the public. Even so, maybe hamstrung by his own fiscal prudence, he failed to win the reelection 4 years later after administering through austerity.

## Opportunities and Challenges

Local autonomy has achieved a significant amount since its implementation in South Korea. These include an expanded scope for representative democracy, with more elections and more opportunities for public input into governance. There has been a measure of decentralization and the ability for local citizens to exercise more discretion in addressing their own affairs. Civil society has expanded at the local level as organizations previously active at the national level expand to press for local changes and new organizations are formed at the local level. Policy innovations and reforms have come about, particularly in local development strategies, open government policies, improvements in civic petitioning of local government, and improved health services (Ahn 2005).

On the other hand, there have been problems and challenges. These include legacies of authoritarianism, with the central government continuing to limit local autonomy through limiting resources, through supervisory authority, and through inspections as well as local elites taking advantage of the position of the local executive to concentrate power (Kim 1997b; Ahn 2005). This very power also gives an opening for irresponsibility and corruption among elected officials. Resident satisfaction with local policies is often low, and corruption has continued with bribery, numerous violations of election law, and political fraud (Ahn 2005: 55–56). Patronage spending and waste on economically unviable projects have also been an issue (Kim and Kim 2003; Ahn 2005: 58–59).

Local government does not have much of a participatory character, but instead retains a strong representative character. Even so, the representative local councils have largely deferred to local executives, who often wield more power than legislators in national government (Ahn 2005). The local council does not seem to have fulfilled its democratizing potential, although the example of the council battles in Seoul covered well by the national media would suggest otherwise (Lee and Anderson 2015).

Although there have been increases in civic activity at the local level, it is not always clear how well local residents understand and engage in local issues. Local elections seem to be used by voters as a referendum and check on the current government, and this nationalization of elections has restricted the features of local accountability, while local election results have generally replicated regional patterns of political support (Park 2006: 16). Context matters in relation to the fortunes of a president's party in local elections,

particularly as the presidential term lasts 5 years while local elections are held every 4 years, and a president's popularity tends to decline over time (Song 2009: 189–190).

President Kim Dae-jung's party fared well in 1998 near the start of his term, but as he neared the end of his presidency with declining popularity in 2002, the conservative opposition won 11 of 16 regional executive offices (Song 2009: 189). Late in Roh Moo-hyun's (Roh Mu-hyeon) term in 2006, the conservative opposition made further gains (Song 2009: 202). President Lee Myung-bak (Lee Myeong-bak) had likewise lost his luster by 2010, and his party lost six regional executive offices, with gains made by all opposition parties. The 2014 elections were mixed. Relatively early in the Park Geunhye Administration, her party made gains overall, though the lead opposition did well in metropolitan cities, including Seoul. Following Moon Jae-in's (Mun Jae-in) popularity and public approval of his meetings with Kim Jong-un (Kim Jong-eun), his Democratic Party made major gains almost exclusively at the expense of the main conservative opposition Liberty Korea. At least since 2010, there have been deliberate attempts to encourage this, with the liberal Democratic Party and left Democratic Labor Party forming an electoral alliance to advance the program for free school lunches as the representative policy of their "welfare state theory."

There is also evidence that local voters vote more based on a reaction to the president's performance only when national issues have salience. Relative popularity of the incumbent local executive and support for a regional party are among the most important local factors. These tend to have more impact when there is little salience to national issues (Song 2009).

After a decline from 68% in participation in the 1995 local elections down to a low of 48.99% in 2002 (Park 2006), participation has steadily rebounded since to 51.6% in 2006, 54.5% in 2010, 56.8% in 2014, and up to 60.2% in 2018. This is in spite of elections requiring multiple complicated and potentially unrelated decisions for an electorate used to making one choice during presidential elections and two during National Assembly elections. Voters do seem to be warming to local government and are getting involved even as the process continues to become more complicated. There also seems to be an increase in civic activity at the local level (Bae and Kim 2013) and an increase in the number of civic groups nationally and active in local affairs since the implementation of local autonomy (Kim 2010: 802).

# Local Church as Social Action

Sabrina D. Wooten
Strategic Impact Services, LLC, Walden University, Virginia Beach, VA, USA

## Definition

Virginia Poverty Measure (VPM): A measure that estimates poverty at the sub-state level, accounting for public assistance that impacts household economic security, such as food stamps, welfare programs, and housing assistance.

Targeting: Is a process which benefits are channeled to the members of the high priority group that a program aims to serve.

## Introduction

It is no secret that the tumultuous effects of the economy negatively impacted localities, states, and as well as individual households. Most individuals know at least someone who is struggling with a mortgage payment, car payment, as well as everyday necessities such as food. The rising costs of taxes and unemployment have forced some individuals and households to seek help to obtain supplies as well as feed their families. In fact, the need is great across the nation, especially in Hampton Roads. There is a consistent rise in the need for food supplies and food bank services. According to the Foodbank of Southeastern Virginia, the number of clients served has increased

at least 24% from the same period last year (www.hamptonroads.com). Additionally, other Hampton Road agencies have similarly witnessed a growing demand for food and supplies.

Unfortunately, collecting monetary and food donations is not successful in providing the support and assistance required to address the level of disparity. Hence, current donations are not commensurate with the demand for food. Moreover, the high demand for food coupled with the shortage in resources and supplies leads to a significant shortage for the families and households located in Hampton Roads and beyond.

Proponents of the food bank industry are uncertain of the direct cause of the increased demand for food and supplies within the community. Yet, outreach workers, charity workers, and coordinators attribute the following factors to this enigma (Ibid):

1. Slow economic recovery from unemployment and under employment.
2. Sequestration – substantial budget cuts that have extracted defense funding vital to the region. An ODU study estimated that sequestration resulted in the loss of 12,000 jobs and 2 billion dollars in decreased spending.
3. Five percent cut in food stamp benefits and other programs.

The abovementioned factors impacted 211,000 households with children (Ibid). In addition, the elderly and veterans are negatively impacted as well.

One local church in Norfolk, Virginia, has partnered with other proponents of this social problem to help battle against poverty and hunger. Calvary Revival Church commenced working with the mayor of Norfolk, Virginia, and the Mayor's Commission on Poverty Reduction over 3 years ago to help provide solutions and recommendations to improve the lives of citizens living in poverty. The Mayor's Commission on Poverty Reduction contributed several factors to the immense level of poverty that persists in the Norfolk community. The commission noted factors such as the lack of education, job loss, unplanned pregnancies, as well as the lack of opportunities for a competitive salary to name a few (City of Norfolk, Communitas Consulting (CC) 2014). In addition, the commission elaborated further on the issue of education and employment in the following manner: "the two largest factors affecting poverty are educational attainment and economic opportunity. There is a strong and direct relationship between educational attainment, earnings and employability. The Bureau of Labor Statistics reports that in 2012 an adult (aged 25+) with a bachelor's degree earned about 60% more than an adult with just a high school diploma and was only about half as likely to be unemployed" (City of Norfolk, Communitas Consulting (CC) 2014).

As a result, the commission formulated a strategy that focuses on four critical areas that will stymie poverty in the future. The four factors consist of supporting early childhood development and parents, strengthening opportunities for adults to thrive in the workplace, improving the education and career paths of young adults, and revitalizing neighborhoods within the city (City of Norfolk, Communitas Consulting (CC) 2014). Consequently, it is also important to note that Calvary Revival Church led the discourse for revitalizing the Norfolk community. For instance, the organization coordinated and held community meetings to discuss a strategy to revitalize the local area with regard to generating revenue as well as attracting new corporations to the local area. In fact, the ministry had an intricate role in formulating a solid plan to rebuild the local business arena and marketplace near the church. The organization provided a substantial amount of feedback concerning this area and offered its expertise and facility to host subsequent meetings. Hence, Calvary Revival Church is committed to partnering with the citizens, business leaders, and government officials to bring future stability and transformation to the municipality. Furthermore, the organization is an integral partner, agent of change, and an oasis in the desert for the Norfolk community.

## Profile of Residents Served in Norfolk

A recent report on poverty in Norfolk provides a snapshot of the current situation; Norfolk had a 2012 unemployment rate of 12.8% representing 14,703 individuals. Statewide, the comparable rate is 4.8%. The unemployment rate is higher for those aged 16–24 years old (43.2%) than for those aged 20–24 (22%) and 25–44 (11.3%). Regarding education, individuals with less than a high school diploma had the highest unemployment rate (15.5%), followed by high school level education (11%) and some college or associate degree (11.2%).

Regarding race and ethnicity, African-Americans in Norfolk have an unemployment rate of 17.5%, compared to the unemployment rate for African-Americans statewide rate of 12.2% (City of Norfolk, Communitas Consulting (CC) 2014).

"In Norfolk and across the United States, those living in poverty are disproportionately young. While around 20 percent of Norfolk's population lives below the poverty level, more than one in four of Norfolk's children experienced poverty in the last year (versus one in seven children statewide.) Over half of Norfolk residents (about 22,300) living below the poverty level are under 25 years of age, and 35 percent (about 14,000) are children under the age of 18" (City of Norfolk, Communitas Consulting (CC) 2014). "Using the Virginia Poverty Measure (VPM) the authors estimate that in the West Hampton Roads region 18% of children live in poverty and another 26% of children live between 100% and 150% of the poverty line" (City of Norfolk, Communitas Consulting (CC) 2014). This accounts for a total economic insecurity rate of approximately 44% of children. About 32% of these children (or approximately 25,000 of 78,000 total children in or near poverty) live in married-parent families. The socioeconomical impact on children, youth, and minorities is staggering and unprecedented. The grave disparity in education and the lack of planning demonstrate that a diverse lifestyle and way of thinking must be embraced prior to effective change taking place. Accordingly, the individuals impacted by these external factors must take personal responsibility for the current situation and intentionally embrace steps to move forward in the future. Yet, progressing forward will not only require personal responsibility, this course of action will also require accountability from the key stakeholders that include government officials, community leaders, citizens, business professionals, parents, educational officials, and other neighborhood gatekeepers as well as conscientious planning. As a result, there is a call to action within the community and surrounding areas. The key players must execute the strategic plan that has been set forth by the commission and seek tangible results. Calvary Revival Church is at the forefront of this movement ready to work hand and hand with the proponents associated with this revolutionary change.

## Need for Food Bank Services

Recent statistics indicate that food bank services have increased in the Hampton Roads area about 24% (www.hamptonroads.com). Increased unemployment due to increased job loss is a major component of this development. Additionally, the reduction in social services such as Medicaid, food stamps, Medicare, and other pertinent programs have made it increasingly difficult to meet basic needs such as purchasing food, purchasing gas, paying utilities, and paying mortgages. Additionally, the major budget cuts with regard to the military in Hampton Roads have really hit home. In fact, every facet of Hampton Road's economy has been impacted by the budget cuts.

## The Local Church Provides Food Distribution Services

A local ministry, Calvary Revival Church located in Norfolk, Virginia, reaches out to support people in need who are impacted by economic hardship within the community. The outreach department operates a substantial food and clothing distribution program that serves participants throughout

the Hampton Roads area. The budget for this program is about $20,000, and the purpose of this program is to assist struggling families with basic needs and resources. The local church receives supplies from local organizations as well as weekly donations from congregants and local food banks.

## Organization Description

Calvary Revival Church consists of three separate entities to include the church, school, and a retail bookstore. The vast majority of staff members are members of the church and play a vital role in the organization. The church consists of a marketing department, outreach/mission department, human resource department, operations department, accounting department, and administration department. This organization is responsible for five local church plants, salvation of many souls, as well as the church home of citizens, local, national, and worldwide. The strategic outreach department operates a midsized food and clothing distribution program that serves the homeless communities in Virginia Beach, Norfolk, and Portsmouth.

## Strategic Outreach Department

The outreach department consists of an outreach director, one staff member, and several volunteers. The characteristics of the clients are as follows: individuals and households that have an annual income below the poverty line. Additionally, they represent a low socioeconomic and educational status. In addition, client participants are homeless, inner-city individuals who have succumbed to hard times. Consequently, statistics describe the characteristics of individuals who live in poverty as follows (www.dss.virginia.gov):

- Twenty-one percent have less than a high school education, 10% are high school graduates or have a GED, 4% have some college.
- Fifteen percent are 24 years old and younger, 8% are 25–64 years old and 8% are 65 years old and older.
- Thirty-one percent are households with children headed by females and 4% are married with children.
- Nineteen percent are Black individuals, 8% are Caucasian individuals and 8% are Asian individuals.
- Thirteen percent are Hispanic and 8% are non-Hispanic.
- Nineteen percent have a disability.

These individuals require services that are offered by the food distribution program available at the ministry.

The mission of the Strategic Outreach Ministries' Program is to reach urban and global communities with the Great Commission mandate. The food distribution program is a part of the Urban Mission Ministry. The goal is to provide food and supplies to residents of Norfolk on a weekly basis. Similarly, the goals and objectives of the overall outreach department are clearly defined as follows: "the overall goal of the Outreach Department is to reach the community through meeting the needs of people before proactively sharing the Gospel. The objectives of the department are met in the following manner:

1. Mobilizing community efforts through prayer and discipleship.
2. Establishing local sites to mentor and/or tutor students and adults preparing for the General Educational Development Exam (GED).
3. Developing a ministry dedicated to serving youth that encourages a lifestyle of positive self-image and strong moral character.
4. Providing food and clothing for the homeless in the community and those that need assistance" (Nyirenda 2014).

In addition, the goal and the objective of the food distribution program is as follows:

(1) "Come along side those who require food assistance by supplementing their grocery needs, but not taking on the role of meeting all their grocery needs" (Ibid).
(2) Help others embrace life, live life and give life.

According to Dr. Nyirenda, the Outreach Director, the goals and objectives of the program are met and exceeded each week (Ibid). Dr. Nyirenda states that this fact is evidenced by "the heart of gratitude" and the amount of clients that are serviced on a weekly basis (Ibid).

Accordingly, the effectiveness of this program stems from the fact that the program serves a high percentage of clients on a weekly basis. For instance, the volunteer staff serves about 839 families a month with an average of 4686 individuals per month (Ibid).

In the same manner, the outreach director states that the program requires at least "$146.00–$ 289.00" a week to feed the average family. The associated expense is successfully met each week as the organization adjusts its budget to the number of clientele served on a weekly basis (Ibid). Next, the food distribution program offers spiritual encouragement to the participants of the program. This characteristic is a tenet of the mission of the organization that includes the outreach program. The vision of the organization is to "build an overcoming church out of broken lives through the power of Jesus Christ" (www.crcglobal.org). In addition, the mission of the organization is to embrace life, live life, and give life. As a result, the outreach program was designed to minister to the natural desire for food and the spiritual need for salvation and transformation. Although this element of the program cannot be accurately assessed through cause-and-effect data, the ministry has experienced more than 20,000 salvations within the organization in the last decade of ministry. Furthermore, according to the outreach director, the lives of clients are changed because many of them express that they have received salvation and have changed their lives. For instance, several of the program recipients express gratitude and come back to serve as volunteers to support and serve others in need (Nyirenda 2014). Therefore, the director indicates that this characteristic is essential to the overall success of the program and the kingdom of God.

The strategic outreach department also expands its influence by reaching out to the homeless and impoverished who are on the streets of Norfolk, Virginia Beach, and Portsmouth.

For instance, the ministry team delivers food, blankets, water, and clothing to people in need by van on a weekly basis. Additionally, the ministry provides street ministry services on-site by spreading the Gospel of Jesus Christ and the message of salvation. Many lives are saved and transformed by the power of God.

In the same manner, the ministry visits local communities in Norfolk, Virginia, such as Calvert Square and Young's Terrace where the highest concentration of poverty exists providing door-to-door evangelism, mentoring programs, as well as the GED program. The following programs were designed and deployed by Calvary Revival Church to assist the needs of this community as well as other surrounding communities. For example, Kingdom Igniters provide community outreach with prayer walks and discipleship programs. Secondly, Kingdom Educators provide the ladies with a Mission mentoring program for girls and the My Brother's Keepers mentoring program for boys as well as the General Educational Development (GED program) for adults. Next, Kingdom Revivers provide ministry and support to local nursing homes in the Hampton Roads area. Finally, Global Missions partners with Bosnia, Uganda, Kenya, Dominican Republic, India, Southeast Asia, Columbia, and China and has planted numerous churches. The goal of the Global Mission program is as follows: (1) cutting-edge evangelism, (2) church planting (3), leadership development, and (4) economic empowerment.

Currently, Calvary Revival Church supports five church plans in Uganda and is in the process of establishing two more church plants. In addition, the goal for the future is to plant ten churches in Uganda and create the Calvary Mission Center that consist of a church, children's center, kindergarten, as well as a vocational training center. The Mission Center will serve one hundred (100) children in kindergarten, fifty (50) young people in the vocational training center, twenty (20) orphan children, and one hundred-fifty (150) people in the church. Hence, the ministry not only impacts the local community but the nations as well.

## Conclusion: Elements of an Effective Outreach Program

A brief literary review highlights the essential elements of an effective outreach program. First, Collins et al. reports that their outreach programs were effective as a result of "street" or community outreach in which the outreach workers worked one-on-one with participants (1999, p. 279). The outreach workers were successful in distributing HIV/AIDS prevention messages in the form of role models, safe sex materials, and personal persuasion tactics (Ibid). In fact, findings indicate that the outreach program and intervention can effectively modify AIDS/HIV behavior. Second, targeting was emphasized by Houssou and Zeller as an effective element of their outreach efforts to provide food to the poor and vulnerable (2011, p. 627). According to the authors, targeting involves two elements "first, defining who should receive benefits (e.g. poor, vulnerable) and second establishing mechanisms for identifying these people" (Ibid). Next, Rajabiun et al. researched and emphasized programs designed to identify, enhance, and evaluate service-delivery strategies to engage underserved HIV/AIDS primary care (2007, S-9). The authors accredit the successfulness of their outreach program to "relationship building, referrals. HIV information, appointment, accompaniment, service coordination, program information as well as HIV risk counseling" (Ibid, S-19). Finally, Brandon et al. reports that program design is an essential element to a successful outreach program (1994, p. 62). The authors note that there are two diverse models of outreach that require different program activities and organization. The two programs are individual client advocacy programs and community services programs (Ibid 1994, p. 76). Implementing the wrong model may result in major consequences. Thus, administration must implement the correct design model to experience a successful outreach program.

The authors also offer the following lessons to improve outreach programs (Ibid 1994, p. 77):

- Allocate primary resources to appropriate outreach efforts such as campaigns to increase participants.
- Select and implement the appropriate organizational strategy.
- Employ or increase staff to address increased participant numbers.
- Joint training must be mandatory with outreach program activities. "Training should be repeated periodically as legislative and administrative requirements change" (Ibid).

This organization has implemented the abovementioned elements to comprise an effective outreach program within the Hampton Roads' community. Matthew 5:13–14 confirms that the church is the salt of the earth and the light of the world. A city that is set on a hill that cannot be hid. One local church in Norfolk, Virginia, shines as a beacon of light in the Hampton Roads area by providing much-needed supplies, services, and food to those who are less fortunate. This organization made its primary function to serve the social needs of its citizens on a weekly basis. Although serving the needs of others is a challenge and a daunting task, this organization has served the community well for over twenty-six (26) years. As a result, this service has spawned a community of people whose lives are restored and forever transformed.

## Synonyms

Locality development

## Definitions

| | |
|---|---|
| Local Economic Development | A bottom-up approach to development involving collaboration between local government units (LGUs), the private sector, nongovernmental organizations, and other actors utilizing available local resources aimed at creating new employment opportunities, income generation, and infrastructure provision with the object of poverty reduction and improved quality of life of residence within the LGUs. |
| Implementation | The translation of a public policy into action in order to achieve the stated objectives of the policy |

## Introduction

Local economic development (LED) as an alternative to top-down approach to development emerged from the global North during the late 1960s and the early 1970s (Blakely 1994: 50) following the development impasse, failure of preceding development approaches, and the unsatisfactory outcome of structural development adjustment programs (Blakely 1994: 50; Nel 2001: 1004). In the South, Nel (2001: 1004); Rodriguez-Pose and Tijmstra (2005: 3); Yatta (2015) and Helmsing (2003) argued that economic challenges, changes in the national and international economic environment, forced structural adjustment programs, natural and political shocks and their outcomes, namely, poverty, unemployment, a fall in industrial activities, debt crisis, colossal currency devaluation, and the inability of governments to intervene at the local level culminated in the implementation of LED as a development strategy. However, the developed and developing countries responded differently. While the former responded through heavy investment, big business support and large project developments undertaken by well-resourced local agencies, the latter took the form of community-based initiatives, utilizing indigenous skills and seeking primarily to ensure survival, rather than participation in the global economy (Mensah et al. 2013a:146).

This digest interrogates some of the nuances that shaped the implementation of LED as a public policy. The entry discusses the meaning to tease out some features of LED, the implementation strategies, financing LED, the actors, dynamics shaping LED implementation, beneficent outcomes, challenges in LED implementation, and conclusion.

## The Meaning of Local Economic Development

LED as a developmental and social science lexicon has a legion of definitions. Generally, LED has been defined as a partnership between the public, private, nongovernmental organizations,

and local government units (LGUs) with the principal goal of creating local employment (World Bank 2003: 1; The United Nations Human Settlement Programme (UN-HABITAT 2005: 2; Blakely 1994: 49). The partners in LED utilize available local resources (human, natural materials, and institutions) as well as formulate endogenous policies to create new employment opportunities for the local citizens. The UN-HABITAT (2005: 2) posited that it is aimed at improving the future quality of life of all people within a given geographical area with emphasis on the poor and marginalized and it is self-sustaining. The LED is therefore a bottom-up process, which is driven by local actors using local resources to develop the economic capacity of localities to improve the economic status and the quality of life of residence for poverty reduction in the LGUs. Agbevade (2018b: 9) extrapolated the following six features of LED. First, LED is an ongoing process involving several stakeholders sometimes with competing and conflicting interests. Second, LED is participatory in nature with the involvement of all actors. However, the extent of actors' involvement is contingent on its strength and resources. Third, it is territorial in approach. Thus, it focuses on localities and not sectors. Fourth, it uses the available resources of a locality to drive the employment creation, income generation, infrastructure development, and poverty reduction agenda of the area. Fifth, it is bottom-up in nature rather than the widely accepted top-down model of development and sixth, it is aimed at improving the quality of life of people within a locality through the economic stimulation with its resultant creation of decent jobs, income generation, and poverty reduction.

## Local Economic Development Implementation Strategies

Implementation in public policy refers to the series of activities undertaken by government and its institutions to achieve the goals and objectives stipulated in policy statements. It is regarded as the action phase of the policy process. Policy implementation sits within the "policy cycle," which involves series of discrete processes beginning with agenda setting, policy formulation/adoption, implementation, monitoring and evaluation, policy change or termination. LED policies are implemented through LED strategies.

LED strategies refer to planned actions for specific development goals of a community derived from the available opportunities – economic and social. Strategies are vital in the implementation of LED because they provide clarity of thought and generate consensus during the local economic development process (Blakely and Bradshaw 2002: 158). The UN-HABITAT (2005: 2) also sees LED strategies as process-oriented and nonprescriptive endeavors, which incorporate three elements, namely:

(i) Local values such as poverty reduction, basic needs, local jobs, integration of social and environmental values
(ii) Economic drivers, which include value-added resource utilization, local skills training, local income retention, and regional cooperation;
(iii) Development, which encompasses the role of structural change and the quality of development

Helmsing (2003) enumerated three new generations of LED initiatives, which are, community economic development, enterprise development, and locality development. It is from these initiatives that LED strategies are derived. Notable LED strategies include "One Village One Product" (OVOP) in Malawi, beekeeping in the West Nile in Uganda, tourism, Multi-Purpose Community Centers (MPCC) in South Africa, micro-credit provision, agro-processing, structural development, health and educational activities, upgrading the skills of artisans, provision of market, capacity development, business permitting, etc., in Ghana. LED has had minor impact due to the excessive concentration on the "hardware" aspect of LED, which is infrastructure instead of the "software" aspect, which encompasses training programs, access to credit, and other intangible strategies that promote local economic development (Oduro-Ofori 2016). The

effectiveness of LED strategies hinges principally on the creation of enabling environment by LGUs. Economic hardware, economic software, and organizational capacity are the three forms of enabling environment in LGUs and these significantly enhance LED implementation (Rodriguez-Pose and Tijmstra 2005: 17).

LED implementation is boosted with strategic planning (the UN-HABITAT 2005: 3; Rodriguez-Pose and Tijmstra 2005: 2–3; Yatta 2009: 301–306). Strategic planning is important in LED because it serves as a blue print for implementation and a more flexible and effective approach to simultaneously enhance economic growth and poverty reduction. To derive the benefits of strategic planning, four key strategic questions must be posed. These are "where are we now?; where do we want to go?; how are we going to get there?; and how do we know when we have arrived?"

Successful implementation of LED requires resources and capacity. Most LED interventions have concentrated on the resource aspect to the detriment of the capacity component. However, when capacity is given the needed priority, it has the advantage of making up for the limited resources in LED because capacity has the tendency to turn the resources into development opportunities (Blakely and Bradshaw 2002: 56). Other push factors for successful LED implementation include the use of local materials, avoidance of waste, diversification of local economic activities, subsistence production, and the creation of niche market (Lasimbang 2008).

Appropriate and strong institutions are linchpins in LED implementation. The UN-HABITAT (2005: 4) proposed four activities that governments should undertake for effective LED implementation. These activities are: first, the combination of governance with culture to gain respect, legitimacy, and acceptance of the local citizens; second, the need for clear decision rules and procedures in government; third, safe political environment; and fourth, an enabling environment that should have a high ease of business entry and efficient regulation enforcement. Weak state institutions coupled with excessive politicization negatively affects LED implementation.

## Financing Local Economic Development

Finance is sine qua non in the implementation of LED policies. No wonder Blakely and Bradshaw (2002) identified it as one of the six critical ingredients for successful LED implementation. Rusu (2014) indicated that the successful implementation of LED hinges a lot on financial stability because its unavailability makes implementation a wild goose chase. LGUs have different sources of financing LED. These include Internally Generated Funds (IGF), higher government tiers, intergovernmental transfers, and donor or private sector funding (Agbevade 2018a: 61; Patterson 2008: 11–15). Most LGUs do not have secured sources of LED financing hence the continuous reliance on unpredictable charitable donors such as the World Bank, European Union, United States Agency for International Development (USAID), and Department for International Development (DFID) (Patterson 2008: 11–15). The dependence on these funding sources has resulted in the truncation of numerous LED projects when these organizations withdrew from the projects due to either policy expiration or new organizational direction. The ability of LGUs to attract funds for LED programs depends on the category of the LGU, the political commitment of the leadership to woo investors to the area as well as how the locality is marketed to the outside world and the strategic location of the locality to national politics (Agbevade 2018a: 65–67).

## Actors in Local Economic Development Policy Implementation

Actors are stakeholders with a stake in a policy. Actors in LED implementation may be categorized into primary and secondary actors. The primary actors include the LGUs, the LED beneficiaries, the central government, and other actors with direct responsibility in implementation. The secondary actors are those with no explicit role in LED implementation but their involvement helps in shaping LED implementation. They include transaction advisors, service providers, consultants, etc. The LGUs as kingpins

are required to provide the necessary conditions such as basic infrastructure and urban development services for the private sector to function effectively. In addition, the LGUs should actively interrogate their economic base, understand local obstacles to economic growth and investment and pursue strategically planned programs and projects (The World Bank 2003). The LGUs must also aid the informal economy within their jurisdictions through business support, such as training in business management (Nyawo and Mubangizi 2015: 1–15). These roles are performed through participation, facilitation, regulation, and adjustment of LGUs. LGUs are able to perform these onerous tasks if they have the needed capacity. Actors in LED are not cast in iron. The actors are determined by the locality and the type of strategy pursued.

## Dynamics Shaping Local Economic Development Implementation

LED implementation is shaped by diverse dynamics. Some of these are political; leadership will and commitment; land tenure system; and administrative, procedural, and institutional issues (Agbevade 2020b).

First of such dynamics is politics. Politics is ubiquitous and as such it impacts LED programs. This often takes the form of political recruitments to the LGUs and the commitment of these political appointees to the implementation of LED. In addition, LED implementation involves a plethora of actors with vested interests, complexity of joint action, and several veto points. As a result, LED implementation is characterized with conflicts, negotiations, bargaining, and struggles, which are features of the public policy process. During these, the actors with resources, strength, and strong bargaining power dominate the less endowed. The existence of actors is not sufficient but the willingness of these actors to cooperate with each other is paramount.

Further on the politics of LED, Wolman and Spitzley (1996: 130–131) argued that politicians engage themselves in LED activities for two reasons. These are: one, credit claiming, which is defined as an act to generate a belief in a relevant political actor(s) that one is personally responsible for causing the government, or some unit thereof, to do something that the actor(s) considers desirable. Two, blame avoidance, which stems from the fact that politicians wish to avoid the accusation of standing by and doing nothing while the citizenry are unemployed, there is less infrastructure in the locality and high level of poverty.

A second dynamic is land tenure system. Land tenure system refers to the mechanisms of land ownership within a geographical area. Land ownership is central to the success of LED. As such when LED beneficiaries do not have access to land to do business, LED programs will be deemed as not successful.

A third dynamic is leadership will and commitment. Leadership is paramount and cannot be ignored in LED implementation. This is because leadership gives guidance, direction to public policy as well as allocates the needed resources to execute the objectives of the policy. Therefore, the degree of leadership will and commitment to the implementation of LED goes a long way in shaping the success or failure.

Administrative, institutional and procedural issues matter in LED implementation. This is because public policy is a process that involves several actors (institutions). Robust and independent institutions and processes influence the LED process. However, when these are not independent and robust, they will be subject to the whims and caprices of politicians who manipulate them to their political advantage.

## Beneficent Outcomes of Local Economic Development

The end result of every LED policy is to create new and decent employment opportunities, income generation, infrastructure provision, and poverty reduction aimed at improved quality of life.

The benefits of LED have been classified into social and economic (Rodriguez-Pose and Tijmstra 2005). Socially, the implementation of LED strategies have empowered local societies

and generated local dialogue as the local citizens participate in decisions affecting them. The LED process also made local institutions more transparent and accountable, thereby strengthening the growth and development of civil society organizations. Economically, LED strategies generated sustainable employment in enterprises more capable of enduring changes in the global economic environment and contributed to attaining goals of decent work.

The benefits of LED do not inure to the entire LGUs because most of the interventions were limited in scope and therefore cover limited number of residence. Agbevade (2020a) for instance argued that LED culminated into poverty reduction; however, the benefits were limited to the households of LED participants.

## Challenges to Local Economic Development Implementation

The implementation of LED is fraught with several hiccups, which hinder the attainment of policy targets. Notable among the challenges are finance, bureaucratic red-tape in the issuance of business permits, inadequate human resource, poor work ethics, excessive politicization, lack of beneficiary involvement in target setting, implementation of rival LED policies, poor land tenure system, etc. These challenges cause the implementation of LED to either be "dead on arrival," truncated midway, or non-realization of LED policy objectives.

## Conclusion

The practical details of local economic development as a public policy have been discussed. LED is the magic wand or game changer for locality development across the globe. However, this will not occur in a vacuum. Appropriate policy measures such as committed leadership; strong, robust, and independent state institutions; a workable land tenure system; financing; and minimum political interference are needed. If these impetuses are provided, the desired outcomes of LED including decent job creation, income generation, infrastructure provision, and poverty reduction aimed at improved quality of life will be attained globally.

# Local Finance in Japan

Shunsuke Kimura
Professional Graduate School, Meiji University, Tokyo, Japan

## Synonyms

Block grants; Budget; Categorical grants; Tax

## Definition

The Japanese local finance system is designed to establish guarantees and equalization for local governments.

## Introduction

One of the objectives of this paper is to explore the local finance system in Japan. The Local Autonomy Law prescribes that each local government shall perform inherent community affairs, while it will also enable to provide different services developed by its own or those approved of by cabinet order or other laws. The area of local governments' activities is extensive and they have played a significant role in civil service. Therefore, Japanese local expenditure has been basically larger than that of the central government since FY 1953. Such significant functions by the local governments are supported by their finance system.

Framework of local finance system includes trends, division of responsibilities, and finance program. Japan has a two-tier system of local government that consists of prefectures and municipalities. As of August 1, 2018, the total number of local authorities (i.e., prefectures and municipalities) was 1,771: 47 prefectures (including Tokyo Metropolis) and 1,724 municipalities.

The total annual expenditure in the Ordinary Accounts of all local governments in FY 2015 (April 1, 2015, to March 31, 2016) amounted to 98.4 trillion yen (net) or USD 984 billion, expenditure by prefectural authorities amounted to 50.7 trillion yen (gross) or USD 507 billion, and the municipal authorities including Tokyo's wards amounted to 56.5 trillion yen (gross) or USD 565 billion. After World War II, local governments' expenditure grew more rapidly than that of the central government. The enormous increase in local government expenditure after the war was caused not only by inflation but also by a significant expansion of local government functions in various fields, encouraged by the spread of the concept of the welfare state. Major expansions

occurred in the following fields: education, security, public health service, and public works.

In Japan, corresponding to their characteristics, responsibilities for public administrative affairs are divided between the central and local governments according to national laws. The distribution is stipulated in the relevant national laws as follows:

1. Affairs related to safety: diplomacy, defense, judiciary, and criminal punishment are handled by the central government; police forces are managed by prefectures; and fire defense and family registers are the responsibility of municipalities.
2. Affairs related to the maintenance of social capital: large-scale roads and rivers that extend over a wide area are maintained by the central government; others are the responsibility of the local governments.
3. Affairs related to education: universities are handled by the central government, high school and special education by prefectures, and junior high schools, elementary schools, and kindergartens by municipalities.
4. Affairs related to welfare, health, and sanitation: licenses and permits are issued by the central government; actual services are the responsibility of the locality.
5. Affairs related to industry and economy: matters affecting the nation as a whole are managed by the central government; regional economic development is left to the local governments.

In accordance with this distribution, local governments carry out major aspects of governmental activities and are responsible for about 60% of all government expenditure. Therefore, the central government is expected to guarantee sufficient financial resources to local governments to enable them to perform their services effectively. For this purpose, the central government forms basic policies for local public finance during every fiscal year prior to its start. The local public finance program is a concrete system (hereinafter "finance program"). The policies formed by the central government are consolidated into the finance program, which is not an annual budget but is an indicator of a local governments' financial management. Its role covers the following three points:

1. It provides a means for annually assessing the scale of local public finance. This assessment enables adjustments to be made using national public finances.
2. It guarantees an overall source of revenue for local public finance. If a shortfall in local revenue is anticipated, the central government must ensure that sufficient finances for the local governments are available through various adjustments.
3. It serves as an annual indicator of the local government's financial management. Local governments can obtain information necessary to their budget drafting process by referring to the finance program.

## Revenue: Local Taxes, LAT, National Treasury Disbursements, and Local Loans

### Local Taxes: An Overview

Major sources of local revenues are local taxes, local allocation tax (hereinafter "LAT"), national treasury disbursements (hereinafter "NTD"), and local loans.

In Japan, every ordinary local government is authorized to levy and collect several kinds of local taxes by the local tax law. In the 2015 fiscal year, the total amount of local taxes was 39.1 trillion yen, of which 18.0 trillion yen was prefectural tax revenue and 21.1 trillion yen was municipal tax revenue. Among the prefectural taxes, the prefectural inhabitant tax accounts for the largest share at 33.9%. In the case of municipal taxes, the municipal inhabitant tax was the largest at 45.3% of the total municipal tax revenue.

### Local Allocation Tax (LAT)

LAT is also a principal finance resource. The source of LAT is a certain percentage of the following national taxes designated by the local allocation tax law as revenue for local governments:

(A) 33.1% of the total yield of income and corporation tax (from FY 2015)
(B) 50.0% of the total yield of the liquor tax (from FY 2015)
(C) 22.3% of the yield of the consumption tax (from FY 2014)
(D) The full amount of the yield of the local corporation tax (from FY 2014)

LAT consists of regular allocation tax (hereinafter "RAT") and special allocation tax (hereinafter "SAT"). RAT accounts for 94% of total LAT and SAT accounts for 6%. The Minister for Internal Affairs and Communications (hereinafter "Minister") allocates the total amount of RAT to local governments whose standard levels of revenue are below that of their expenditures so as to supplement the shortfall. SAT is granted to local governments according to their extraordinary financial needs that cannot be satisfied by the allocation of RAT, for example, temporary expenditures for the measures taken to protect against natural disasters.

The LAT system fulfills a significant role as a financial guaranteeing and equalizing system. Through the finance program, the central government takes necessary measures to balance the total revenues and expenditures of local governments at the macro-level when there is a gap between these revenues. The shortfall in the revenue is usually covered by the addition of LAT and other sources of finance. In this respect, LAT plays a significant role in guaranteeing the financial resource at the macro-level.

LAT also functions as the equalization system; this system has played a role in rectifying disparities in fiscal capacity. The sum, which is based on an established formula, is allocated to promote equality in local government revenues and to guarantee well-planned local government administration. The formula is as follows: RAT = standard financial need − standard financial revenue. For each local government, both the standard financial need and the standard financial revenue are calculated every year; as a result, RAT is advantageously distributed to less well-off local government. In this framework, the disparities in the financial resources among rich and poor local governments are considerably reduced by LAT. Since the local governments may use LAT at their own discretion, the LAT system does not impair the freedom of local governments in carrying out their functions.

In FY 2015, LAT was 17.4 trillion yen (RAT 15.8 trillion yen, SAT 1.0 trillion yen, and SAT for recovery from earthquake disaster 0.6 trillion yen), and it represented about 17% of the total revenue of local governments.

### National Treasury Disbursements (NTD)

There are various methods for the central government to disburse funds to local governments. They are usually divided into three categories: disbursements for national tasks, obligatory shares, and grants-in-aid.

(A) Disbursements for national tasks are the funds for local governments that perform national projects due to efficiency and economies of scale. Local governments deal with a number of national projects in various fields of nationwide administration, for example, national election, population census, and so on. The central government shall fully disburse the costs of such services provided by local governments in the form of national treasury disbursements.
(B) Obligatory shares are the funds paid by the central government based on shared responsibility between the central and local governments. In principle, local governments should bear expenses for local public affairs. However, because there are profits both for the local and for the central government, all or a part of the expenses should be borne by the central government as an obligatory share to ensure smooth implementation. Major types are as follows:
    (a) Expenditures for specific or nationwide projects that are required to be financed by the central government in order to ensure smooth implementation. These are projects that are of common interest both to the central and local

governments but must be conducted by the local governments by virtue of the provisions of laws or cabinet orders, for example, expenditures for compulsory education, public assistance, nursery schools, and so on.

(b) Expenditures for public works projects that are implemented by the local governments in accordance with national economic progress plans, for example, expenditures for public works.

(c) Expenditures for disaster-related projects, for example, expenditures for disaster relief, reconstruction after disasters affecting infrastructure and agricultural facilities, and so on.

(C) Grants-in-aid are the funds paid by the central government to local governments with a view to supporting, encouraging, and promoting their implementation. They are not obligatory and the central government has the power to create or abolish them when circumstances change.

## Local Loans

When local governments carry out large-scale construction projects, they are normally unable to finance these projects completely with their current revenues; therefore, they have to secure local loans, which are the necessary funds, through long-term borrowing. In Japan, local government loans are made when road construction, school establishment, and construction work for rebuilding after natural disasters are carried out.

The loans have the following two major roles:

(A) The loans enable local governments to finance large-scale public projects that require significant funds in one fiscal year.

(B) Resources for repaying local loans are found in future tax revenue; thus the burden of payment would be evenly placed upon the residents who benefit from the project across generational lines.

Prior to FY 2005, local governments had to obtain approval from the Minister or the Prefectural Governor to avail local government loans. However, this system was abolished, and the "informed consulting" system started as part of the decentralization reform in 2006. Under this system, local governments must consult with the Minister in the case of prefectures and designated cities, or with the Prefectural Governor in the case of other municipalities, when they plan to avail local government loans. Local governments can avail loans without obtaining an agreement but such loans are assumed to be less creditworthy. Moreover, the "prior notification system" was introduced in FY 2012. Local governments which meet the requirements, such as the real debt expenditure ratio (*) being below a certain level, may, in principle, now make loans without informed consulting as long as they give prior notification. The loans system has been drastically reviewed since FY 2016 by expanding the range of the prior notification system from the perspective of strengthening local governments' autonomy.

(*) This ratio is an index to assess the financial burden of debt service expenditure and quasi-debt service expenditure for each local government.

The amount of the fund is decided in the local government bond plan every fiscal year. From FY 2010 to FY 2016, the total amount of the fund decreased due to the shoring up of local government finances and controlling capital expenditures. However, in FY 2017, the amount of the fund increased by 0.1% in order to deal with the shortage of local funds under the difficult local finance situation, to fulfill local revitalization, to promote disaster control, and so on. Funds for local government loans are classified into three types: government funds, Japan Finance Organization for Municipalities funds, and private funds (publicly subscribed funds and other private funds). Government funds have been decreasing since the drastic reforms to the treasury investment and loan system in 2001. On the other hand, publicly subscribed funds demonstrate an upward trend. In this way, the funding of local loans has shifted from public to private sector funding.

## Expenditure: Outline, Public Debt Expenditure, and Promoting Soundness

The expenditure of the local government is usually analyzed according to two criteria, composition by purpose and composition by characteristic.

In terms of the composition by purpose in FY 2015, the major expenditures were social welfare and security (25.7%), education (17.1%), public debt (13.1%), and public works (11.9%). These data show that social welfare, education, and public works are major public service fields in Japan. Recently, the expenditure regarding social welfare has shown continued and remarkable growth. The major expenditures of social welfare are composed of three types: elderly welfare, child welfare, and public financial assistance expenditures. Each expenditure shows a pronounced increase and these are the current critical issues for Japanese local administration.

Second, in terms of the composition of the same expenditures by characteristic, the major expenditures were salaries and wages (22.9%), capital expenditure for public works construction (14.4%), allowance in aid (13.6%), and debt charges (13.1%). Expenditure on salaries and wages, which has decreased, reached its lowest point in FY 2013; this is the outcome of the local governments' administrative reforms. Capital expenditure has decreased in the same way, but since 2013 it has demonstrated an upward trend. Disaster control was a contributing factor in this trend, which was triggered by the Great East Japan Earthquake in 2011.

Expenditure to repay public debt, with which local governments pay off loans and their interest, is an expense particularly lacking in flexibility and thus necessitating constant vigilance. At the end of FY 2015, the outstanding amount of local government loans, which are loans taken out by the local governments, stood at some 146 trillion yen, and the level remains high at an amount equivalent to roughly 1.43 times total revenues and some 2.45 times total general revenue resources, such as local taxes and LAT. Therefore, the reduction of outstanding loans through pursuing administrative reform has been one of the most urgent issues for local governments.

The severity of the financial situation of Japanese local governments was illustrated by the bankruptcy of Yubari in Hokkaido in 2006. This incident triggered the enactment in 2007 of the law relating to the financial soundness of local governments. The new law improved various aspects of the prevailing system. For example, the following methods were adopted:

(A) Establishment of indexes and full information disclosure
  (a) Establishment of the real deficit ratio as flow indexes, that is, the consolidated real deficit ratio, real debt expenditure ratio, and so on
  (b) Establishment of the future burden ratio as stock indexes, that is, indexes of real liabilities including public enterprises, third sector enterprises, and so on
(B) Attachment of audit inspection reports and reporting to the assembly, together with a public announcement

Through such comprehensive indexes and the examination process, the new system aims at the early detection of the financial deterioration of the local government.

## Key Concepts: Guarantee and Equalization

As previously mentioned, the Japanese local finance system has two key concepts: guarantee and equalization. The central government in Japan takes responsibility for enforcing proper financial practices in local government. Finance programs guarantee adequate revenue to local governments in order to allow them to provide a national standard level of public services; the local governments' allocated responsibilities are basically stipulated by the national laws. Each ministry drafts and enacts various new national laws every year. Some of these laws are structured so that local governments have responsibilities for administrative actions that incur certain costs. Under the financial program, such costs are reflected as the new standardized elements of the

total expenditure of the finance program. After the adjustment of the macro-level balance between the revenue and expenditure in the finance program, the guaranteed financial circumstances for the local governments are substantialized, and their public responsibilities can be carried out. In the context of guarantee, each local government can have a stable budget compilation under the finance program.

Secondly, equalization is also the key concept based on the premise of horizontal equity among citizens. Such equity requires that all jurisdictions have the potential ability to provide common levels of public services at a common tax rate. Therefore, the equalization fund should reflect both differences in tax capacity and those in financial need across jurisdictions. This idea is realized through the RAT, which is paid to local governments whose basic financial needs exceed basic financial revenues. In addition, wealthy local governments whose revenue exceeds need are neither eligible for the fund nor obliged to contribute to fiscal adjustment. This system means that a local government with reasonable tax effort can provide a reasonable level of public service (*). The origin of this system is the Local Finance Equalization Grant Law that was enacted in 1950. During the 1950s and 1960s, Japan was an economically poor country, and the disparities among the jurisdictions regarding population size and the levels of industrial concentrations were remarkable. Therefore, depending on where one lived, there were significant shortcomings in schools, roads, hospitals, waterworks, and medical care for elderly people. In such circumstances, the Japanese government adopted the financial equalizing system in order to provide a national standard level of public services.

To date, these two key concepts have been the linchpins of the Japanese local finance system, and they have exerted great influence on the framework of the system.

(*) Out of 47 prefectures and 1719 municipalities (with Tokyo's Special Wards counted as one municipality), only Tokyo Metropolis and 59 municipalities were not allocated with RAT in fiscal year 2015.

## Challenge and Future Direction: Decentralization and Expanding General Revenue Sources

The challenges of the Japanese local finance system are closely related with decentralization reform. The representative case is the issue of NTD. The system of NTD has proven effective in enabling local governments not only to maintain their administration at a satisfactory level but also to gain sufficient revenue for large-scale construction projects. Thus, the amount of NTD has grown and the field it covers has also expanded. However, such growth and expansion have strengthened centralization. NTD are made conditionally on local governments that comply with strict and detailed operational standards. In the case of the public construction works, even the brands of construction materials and parts were sometimes specified by the central government. Therefore, the system of NTD has been placed under continuous review, and in the period from FY 2004 to FY 2006, there were drastic reforms of three main components of local financial resources, the so-called Trinity Reform.

The reform includes the following elements: a reduction in NTD of 4.7 trillion yen, a transfer of the national tax resources to local tax resources of 3.0 trillion yen, and the streamlining reform of the LAT by 5.1 trillion yen. The outcome of the reform was compromised among different parties, but the reform contributed to strengthening the overall fiscal capacities of local governments. Further decentralization reform is thought to be necessary for establishing more meaningful financial autonomy.

The term "general revenue sources" refers to local taxes, LAT, local transfer taxes, and special local grant/similar grants. They are not earmarked and can be used for any kind of expenses in the same way as general revenue sources. The general revenue sources are, therefore, the core financial sources for each local government's financial management. Local governments have recently offset the remarkable increase in social welfare expenditure with the reduction of human resource expenditure and so on. However, the social

welfare demand is expected to increase further and, therefore, expanding general revenue sources is desired by local governments. Moreover, fulfilling local revitalization regarding population decrease since 2010 and promoting disaster control, especially since the Great East Japan Earthquake in 2011, have been key responsibilities for local governments.

In order to take the appropriate measures regarding such demands, general revenue sources are required. In this manner, expanding general revenue sources has so far been the challenge among local governments. In other words, to set a proper balance between the demand (range of local public services) and the supply (local financial resources) has been the ultimate issue for the local finance system.

# Local Financial Emergencies in the USA

Julius A. Nukpezah
Department of Political Science and Public Administration, Mississippi State University, Starkville, MS, USA

## Synonyms

Financial crisis; Fiscal crisis; Fiscal distress; Fiscal emergencies; Fiscal stress

## Definition

Local financial emergencies are events that affect the economic viability and long-term financial capability of a local government as a going concern because of deteriorating resources, inability to meet operational needs, and failure to repay loans and meet community needs over a period. Financial and economic indicators of the existence of financial emergencies include revenue-expenditure imbalances, expenditure violations, property tax delinquencies, declining assessed property values, increased liabilities, and failure to honor debt obligations when they are due (ACIR 1973; Coe 2008; Crosby and Robbins 2013; Kloha et al. 2005; Beckett-Camarata 2004; Beckett-Camarata and Grizzle 2014; Scorsone and Padovani 2014).

## Introduction

With increasing deterioration in fiscal health, US local governments may go through periods of fiscal watch, fiscal stress, and a declaration of the existence of a financial emergency, which requires an immediate action from governmental actors to avoid further harm to local credibility that affects the provision of public goods and services (Beckett-Camarata 2004). The causes of financial emergencies are multifaceted and a function of the prevailing political environment, the external and internal factors of the local government. Financial emergencies in the USA can be traced to the early history of the country when the national government failed to pay its debt after the revolutionary war that led to independence. However, recent events following the Great Recession have resulted in several local governments declaring financial emergencies. Some of these local governments file for Chapter 9 (Reorganization of municipalities) Bankruptcy protection, which makes discussions about the subject increasingly more relevant.

Although local governments are creatures of their states, state governments may extend to their local governments' Home Rule status that enables them to develop their Charters and be self-

governing. However, during financial emergencies, some states choose to intervene to correct the fiscal indiscipline while others leave to the local governments to fix their budgetary challenges. This entry provides a succinct overview of financial emergency practices across local governments in the American states. It describes the causes of financial emergencies, offers a historical context of it, lists examples of major financial emergencies in the USA, reports on how states and local governments intervene in local fiscal crises, and identifies strategies that contribute to the recovery of local governments from financial emergencies.

## The Causes of Local Financial Emergencies

The causes of local financial emergencies include the following:

1. Periods of economic recession that lead to socioeconomic and demographic deteriorations are precursors of financial emergencies. For example, spiking unemployment rates, high poverty rates, and declining household incomes that characterize recessions affect local government's taxable income (Stone et al. 2015).
2. Shifts in urban populations from declining industrial states to those with better economies and living conditions contribute to home abandonment that not only increase blights in the neglected cities and escalate the cost of city maintenance but reduces revenues from property taxes (Skidmore and Scorsone 2011).
3. Bad fiscal policies of local government leaders cause financial difficulties and consequently financial emergencies (Beckett-Camarata 2004; Nukpezah 2017). For example, corruption, weak structural leadership, and near-sighted decision-making escalated debts of Harrisburg, Pennsylvania, and are blamed on the city's financial emergencies in 2011 (Beckett-Camarata and Grizzle 2014).
4. Studies suggest political factors such as a city's form of government contribute to financial emergencies. For example, the relative inefficiencies of strong mayor form of government accounted for the financial emergencies in some American local governments (Beckett-Camarata and Grizzle 2014; Clark and Gorina 2017; Nukpezah 2017).
5. Exogenous factors outside the control of local governments such as job market shifts, federal and state revenue cuts, global economic liberalism, and the global debt crisis affect local finances leading to financial emergencies (Coe 2008; Kloha et al. 2005; Watson et al. 2005).
6. Natural or human-made disasters increase local expenditures outside budgetary appropriations and potentially lead to financial emergencies (Watson et al. 2005; Beckett-Camarata 2004). For example, a devastating natural disaster such as fire, hurricane, or tornado may disrupt the local economy and destroy its infrastructure making it difficult to honor its debt obligations when they are due.
7. Failure to balance local budget with consequent deficit spending may lead to financial emergencies. Because local governments across most states require their local governments to operate with a balanced budget rule, expenditures that exceed revenue is a clear indication that appropriation rules are being violated and that a local government is experiencing a declining revenue base.
8. With the rate of growth of local employees exceeding that of population growth of the cities they work at, post-retirement healthcare liabilities are increasing due to shrinking local government revenues with consequences for fiscal sustainability.
9. Fraud and mismanagement are yet other reasons for financial emergencies. The Orange County bankruptcy in 1994 was attributed to fraud and white-collar crime, which resulted in $2 billion chapter 9 Bankruptcy filing due to investment losses of the county investment pool.
10. Wrong project projections that produce faulty estimates have also contributed to project

failures and inability to pay debts when they become due. This is because the projects overestimate project benefit over the cost.

## History of Local Financial Emergencies

Historical analysis reveals that a major reason for local financial emergencies is default on debts. Local debt issues across the American states have increased from $40 million in 1850, when only a few local governments consider debts, to about $1.9 trillion in 2018. Local governments are credible borrowers. However, unexpected traumatic events may prevent them from honoring their debt obligations. The first default on debt by an American government was by the federal government in 1790 when it was unable to pay its debt after the nation's war for independence. Similar to state and federal governments, local governments use the bond market to raise revenues for infrastructure projects such as roads, bridges, airports, dams, and sewerage treatment plants among others. The pay-as-you-use method of financing projects ensures that infrastructure projects are implemented for residents to enjoy quality services while they pay for it through taxation, user fees, and charges.

The first local government to default in the payment of its debt is Mobile, Alabama, in 1838 due to economic depression and bank failures (ACIR 1973). Examining periods of major financial crises suggest these coincide with periods of economic recessions. For example, during the 1873–1879 economic recession in the USA, 25 percent of local debts were in default (ACIR 1973). Estimates suggest that two-thirds of the defaults on debt were related to infrastructure development bonds. Similarly, the 1893 economic recession was associated with increased defaults on debt because of reduction in wealth and income caused by the recession.

The peak number of defaults on debt, however, was during the Great Depression (1929–1936) when more than 3,200 local governments defaulted on their debts (ACIR 1973). The Great Recession (2007–2009) was also associated with several local governments declaring financial emergencies with a heightened number of these government declaring chapter 9 bankruptcies (Nukpezah 2017). Periods of economic recession are characterized by high unemployment and loss of wealth and income, which affect the assessed value of property and hence local revenues needed to pay back loans.

## Major Local Financial Emergencies in the USA

- Recent scholarship focuses on Michigan because of the many financial emergencies in the state. Since 2000, more than 20 financial emergencies have been declared in the state. Noteworthy ones include Flint and Detroit. Flint's financial emergency morphed into a public health emergency in 2014 due to contamination of its water supply with lead due to efforts to cut local expenditure on potable water (Nukpezah 2017). Detroit's financial emergency after the Great Recession led to an $18 billion bankruptcy filing in 2013, making it the largest bankruptcy case in US history.
- Although the first local government to default on its debt payment is located in Alabama, the state does not intervene in local fiscal affairs. In 2011, Jefferson County, Alabama, filed a $4 billion bankruptcy due to its inability to meet its bond obligations for investments in its sewer (Howell-Moroney and Hall 2011). Earlier in 2009, the city of Prichard, Alabama, suffered fiscal crisis that affected its ability to pay employee-mandated pensions leading to bankruptcy filing.
- California is another state that does not intervene in local fiscal crisis, opting to leave local governments to address fiscal challenges on their own. Notable recent financial emergencies in the state since 2008 Great Recession include Stockton, which filed a $1 billion chapter 9 Bankruptcy in 2012, and San Bernardino County, which also filed a $500 million bankruptcy in 2012. The state is also known for Orange County financial debacle that filed for a $2 billion bankruptcy after the County

finance manager made risky investments with the County investment pool funds.

- Harrisburg, Pennsylvania, has faced fiscal challenges as well following the Great Recession. It reported an estimated $1.2 billion debt, a $13 million deficit, and missed payments of general obligation debts that were due (Beckett-Camarata and Grizzle 2014). The mounting fiscal challenges of the city led to a chapter 9 Bankruptcy filing in 2011.
- In 1976, local financial emergency was declared in the city of New York, with consequent state takeover and the local government placed in a receivership, which lasted about 10 years (Kossis 2012).
- A study on Ohio identified 15 local governments that were experiencing financial emergencies (Beckett-Camarata 2004). These included Campbell, Manchester, and Plymouth that did not regain fiscal health during the course of the study. Cleveland, East Liverpool, and three other cities regained fiscal health. The major fiscal emergency factors in Ohio cities were increased expenditures in the face of decreasing tax base and declining local revenues.
- Other financial emergencies that led to bankruptcy filings have been due to local fiscal stress that caused the inability to pay employee state and local mandated pensions in Central Falls, Rhode Island (2011). Gould, Arkansas, 2008 bankruptcy filing was due to spending money meant to pay employee income taxes. West Fall County's loss of lawsuit in 2009 led to a bankruptcy filing as well.

## Interventions to Local Financial Emergencies

Interventions to local financial emergencies may come from the local governments themselves, the state, or a combination of both.

### State Intervention Through Receivership

Laws exist in 19 states that allow state governments to intervene in local affairs to restore fiscal discipline (Pew Charitable Trust 2013). The first state to introduce a receivership law is Missouri, although Memphis, Tennessee, was the first US city to be placed under receivership in 1879 following its inability to pay its debts when they were due (Kossis 2012). Receiverships allow the state to take over the administration of a local government during a financial crisis and appoint a receiver (an emergency manager), to address the challenges (Nickels 2016). A state may also provide support through its temporary appointee to reduce local debt, labor cost, and increase funding by authorizing new taxes or dissolve the local government (Nickels 2016).

Although there are nuances in state laws authorizing state interventions, they all invariably recognize state supremacy over local governments in local affairs and see an obligation for states to intervene on behalf of local residents. The authority of the locally elected officials is subservient to that of the state appointed officials during receivership. While cases of receiverships have been contested in both state and federal courts, there exist legal precedent for state supremacy over local governments and that local authority given under Home Rule statute is subservient to state authority (Richardson 2011). Notable cities that have been placed under receivership include the city of New York, New York; Detroit and Flint, Michigan; and Camden, New Jersey.

### Municipal Bankruptcy Filing by Local Governments

Chapter 9 of the US Bankruptcy Code allows local governments to seek federal protection from their debtors if local financial solvency conditions are threatened, and the local government is unable to pay its debts when they become due. Since 1937, when the bankruptcy Code was passed, there have been more than 600 municipal filings across states that allow it for their municipalities. About a dozen of these bankruptcies were filed since the 2008 Great Recession. However, not all eligible local governments take advantage of the legal provision because bankruptcy is not desirable to most local governments and creditors (Callahan and

Pisano 2014; Hendrick and Crosby 2014). This is because it could lead to fiscal challenges for creditors due to loss of outstanding payments. Moreover, local governments could lose their reputation and credibility with future creditors making a bankruptcy filing a rare local event.

## Strategies to Address Local Financial Emergencies

For more than a century and a half, state and local governments have experimented with different strategies to address fiscal constraints. The following are notable strategies governments have employed:

- *Exploring new sources of revenues:* State and local officials tasked with the responsibility of addressing the fiscal challenge consider introducing or increasing fees, user charges, and local taxes to meet budgetary expectations.
- *Reduction in expenditures to produce balanced budgets:* The strategies include the elimination of some government businesses and reduction in the level of public services, such as street lighting, police and fire service, and accessibility of recreational facilities.
- *Reorganization of local government bureaucracies to streamline local budgets:* The reorganization of the local bureaucracies eliminates some offices and merges others to reduce administrative costs to government.
- *Contracting out and fostering interlocal agreements:* Evidence suggests contracting out city services to private, nonprofit, and other public agencies are cost-cutting measures that save local government funds. Smaller cities in fiscal distress usually contract out services such as trash collection to larger ones. Other cities would contract out park and recreational services to the county to reduce cost.
- *Diversifying the local economy:* This is important because many rust belt cities that are dependent on the auto industry experienced fiscal stress following the decline of the industry during the downturn years of recession. However, those cities that are sufficiently diverse withstand the fiscal stress.

## Conclusion

Local financial emergencies have a long history dating back to the 1830s. State and local governments have developed innovations to deal with the challenges that municipalities face. The federal government introduced bankruptcy protection for local governments to address the fiscal challenges. This entry has discussed financial emergency practices across local governments in the USA. It showed that the causes of financial emergencies are numerous and include both internal and external political, economic, social, and environmental factors. The historical analysis revealed that failure to honor debt obligations is a major cause of fiscal crises, which is heightened during periods of economic recessions. While state and local level strategies for combating financial emergencies exists, the focus has been on increasing revenues and reducing expenditures using novel opportunities.

# Local Fiscal Reforms and Municipal Amalgamations in the 2000s in Japan

Hideki Kido
Kyoto Women's University, Kyoto, Japan

## Synonyms

Fiscal autonomy; Local tax system reforms; Municipal autonomy; Municipal reforms

## Introduction

This section consists of two parts to describe the process and consequence of local fiscal reforms in the 2000s in Japan. The first part will mention the process and result of local fiscal reforms implemented by the central government. The second part will explain the municipal amalgamations as a result of local fiscal reallocation.

Following the administrative decentralization in the 1990s, the central government under Prime Minister Junichiro Koizumi implemented series of reforms in local fiscal allocation including fiscal transfer from the central to local governments (prefectural and municipal governments) and local tax system called Sanmi Ittai Kaikaku (the Trinity Reform).

This fiscal reallocation influenced fiscal basis of municipal governments (city, town, and village), especially fiscally fragile small municipalities. As a result, a large number of small municipalities decided to amalgamate with other municipalities to strengthen fiscal basis and the number of municipalities in Japan was reduced from 3200 to 1700 within 5 years.

## Trinity Fiscal Reform

First, this part will explain how the central government implemented local fiscal reforms

consisting of reducing fiscal transfer from the central to local governments and transferring tax resources to local governments. In Japan, fiscal transfer from the central to prefectural or municipal governments takes two forms. One is the Local Allocation Tax (Chiho Kohfu Zei) and another is a Subsidy (Kokko Shishutsu Kin).

In the Trinity Reform, the Local Allocation Tax was cut by 5.1 Trillion Yen, and the Subsidy was also reduced by 4.7 Trillion Yen. At the same time, part of national Income Tax was transferred to local governments by increasing residential tax rate by 3.0 Trillion Yen. In total, local governments gained 3.0 Trillion yen as their own tax resources, losing 9.8 Trillion Yen as fiscal transfer from the central government.

First, the Local Allocation Tax is equalizing fiscal resource disparities among local governments by reallocating fiscal resources according to the gap between the demand and resource of local governments for public services. The demand is calculated based on the population, area size, the number of elementary and junior high school students, and other factors of each local government which relates to the demand of public services. The resource is also calculated based on the number of tax payer, cars, and other factors which relates to local tax.

Local governments can use this transfer for any purpose, so this transfer can be considered as one of the independent financial resource of local governments. Because the tax resources are eccentrically located to urban area, rural municipalities tend to receive more local allocation tax. This transfer has played a role in redistributing financial source to mainly support rural areas because local governments in rural areas are more likely to face severe financial condition than those in urban areas. Consequently, rural areas which have smaller populations have received more local allocation tax per capita.

Second, the subsidy has been mainly used for community development and can be used for predefined purpose set by the central government. In this point, the subsidy is considered as fiscal means of central government to control local governments. Indeed, local governments cannot use subsidy freely, but they can still strategically choose the type of subsidy to accomplish their policy goal.

Figures 1 and 2 show the share of revenue of prefectures and municipalities in 2002, just before the Trinity Reform. At prefectures, Local Tax accounts for about 30% of revenue, and local bonds shares 15% in the revenue. On the other hand, Local Allocation Tax accounts for about 20% and Subsidy constitutes 18% of the revenue. At municipalities, Local Tax accounts for 34% and Local bonds accounts for 10% of the revenue. At the same time, Local Allocation Tax accounts for 18% and Subsidy accounts for 9% of the

**Local Fiscal Reforms and Municipal Amalgamations in the 2000s in Japan, Fig. 1** Revenue of prefectures in 2002 (Source: Made by author based on the data available from Ministry of Internal Affairs and Communication)

**Local Fiscal Reforms and Municipal Amalgamations in the 2000s in Japan, Fig. 2** Revenue of municipalities in 2002 (Source: Made by author based on the data available from Ministry of Internal Affairs and Communication)

revenue. At both prefectures and municipalities, independent revenue resource, which local governments can manage by themselves, accounts for about 40% of the revenue. On the other hand, fiscal transfer (Local Allocation Tax and Subsidy) account for 30% (municipalities) to 40% (prefectures) of the revenue.

Even regarding the independent fiscal resources of local governments, there are strong constraints imposed by the central government on local governments in issuing municipal bonds. In addition, local governments cannot alter tax rates freely by their own authority. Local governments also heavily depend on fiscal transfer from the central government for their revenue sources. In this sense, the central government had strong influence on local governments in terms of fiscal resources. The Trinity Reform changes significantly this local fiscal system.

Figure 3 shows the changes of fiscal resources of prefectures in the Trinity Reform. The central governments cut about 20% of fiscal transfer to local government and at the same time transferred tax resources by increasing the residential tax rate which is one of major tax resources for local governments. Consequently, prefectures gather more revenue from the Local Tax. The same tendencies can apply to municipalities shown in Fig. 4. Municipalities collect more money by the Local Tax after the Trinity Reform. This fiscal reallocation not only promotes fiscal autonomy of local governments but also increases fiscal disparities among local governments. The difference between prefectures and municipalities is the subsidy. The total amount of subsidy from the central to local government decreased by 20%, but most of reduction was to prefectural governments by cutting subsidy for compulsory education. However, cut of the Local Allocation Tax damaged small fiscally weak municipalities and so municipal amalgamation mentioned later started just after the Trinity Reform. The following part will describe the process and factors of the Trinity Fiscal Reform.

Prime Minister Koizumi is well known as a reformer in Japan. He destroyed series of existing governmental system including postal system, public agency, public finance, and so on. Among these governmental reforms, in 2002 the Koizumi Administration launched the fiscal reforms in the local fiscal system including reduction of the fiscal transfer from the central government and increase tax base of local governments. This fiscal reform is regarded as the remaining task which was argued in the decentralization reforms in 1990s but not implemented (Nishio 2007; Kanai 2007). It was thought that political actors both at

**Local Fiscal Reforms and Municipal Amalgamations in the 2000s in Japan, Fig. 3** Prefectural Revenue (Source: Made by author based on the data available from Ministry of Internal Affairs and Communication. Thousand Yen)

**Local Fiscal Reforms and Municipal Amalgamations in the 2000s in Japan, Fig. 4** Municipal Revenue (Source: Made by author based on the data available from Ministry of Internal Affairs and Communication. Thousand Yen)

national and local levels would not agree with fiscal reforms.

Kitamura points out there is the three-way standoff in this reform (Kitamura 2006). National politicians dislike reducing fiscal transfer because they lose influence in determining the allocation of subsidy. Also national government ministries disagree with the reform to maintain their power to allocate subsidy (Ex. Ministry of Land, Infrastructure, Transport, and Tourism), or losing their power resource in taxation by transferring the tax base from the central to local governments (Ministry of Finance). Local governments also oppose to the reform because the total amount of revenue source was supposed to decrease as a result of the reform. Especially local government which rely their fiscal resources heavily on local allocation tax tried to keep the fiscal reallocation system. In spite of these oppositions, the Koizumi Administration implemented three dimension fiscal reforms. Scholars have argued the reason why Prime Minister Koizumi can enforce the reform. There are roughly two groups of study to explain the reason.

First, some studies stress that the central government decide the reform. These studies focus on the leadership of core executives of central government, especially the political influence of Prime Minister Koizumi. They indicate that Koizumi can decide the reform because he receives the support from the public who are in favor of implementing series of governmental reforms (Tanimoto 2008). Kitamura argue that Koizumi managed political interest of Ministry of Finance which seeks financial recovery, Ministry of Internal Affairs and Communication which supports local governments, and other central government ministries which aim at maintaining subsidies (Kitamura 2006). Koizumi provides some benefits to these three types of political actors and persuades them to accept pains of reform.

Second, other studies give their attention to the role of local governments and intergovernmental relations between the central and local governments. Local government groups organized by municipal and prefectural governments negotiate with the central government at the intergovernmental meeting. The Association of Prefectural Governors coordinates the opinion among

prefectural and municipal governments and suggests the contents of reforms including reduction of fiscal transfer and increasing tax base of local governments at the intergovernmental meeting (Sunahara 2007). Another intergovernmental factor is the party organization. The LDP, ruling party of Japan at the time of reform, supports local governments because they has connection with local governments and relies its political activities on local party organization. This connection enables local governments to enhance their interest in the fiscal reform that the central government transfers major tax resources by decreasing income tax at the central government and increasing residential tax at the local government (Kido 2016).

## Heisei Municipal Amalgamation

This part will argue the consequences of local fiscal reforms described above. One of such consequences is a large number of municipal amalgamations, the so-called "Heisei no Dai Gappei (Major Municipal Amalgamations in the Heisei Era, hereafter the Heisei Amalgamation)." In order to strengthen fiscal bases, fiscally challenged municipalities (most of them are small rural side towns or villages) started to amalgamate with other municipalities just after the central government implemented fiscal transfer reforms. The central government also promoted such municipal amalgamations by providing financial support to amalgamated municipalities. As a result, the number of municipal governments was decreased from over 3200 to 1700.

In Japan, Municipalities can amalgamate with other municipalities if they agree with one of two types of amalgamation. One type is Shinsetsu Gappei (Amalgamation by establishing new municipality), and another is Hennyu Gappei (Amalgamation by absorbing surrounding municipalites). If one municipality would like to amalgamate with one or more surrounding municipalities, consisting municipalities usually establish Committee for Coordinating Municipal Amalgamation. After deciding the type of amalgamation, the name of new municipality, the place of municipality office, and other necessary conditions, consisting municipalities amalgamate with each other.

Japan has experienced radical municipality amalgamations three times since the Meiji Era (Fig. 5). First, the municipality system, which

**Local Fiscal Reforms and Municipal Amalgamations in the 2000s in Japan, Fig. 5** Number of municipalities (1888–1999) (Source: Made by author based on the data available from Ministry of Internal Affairs and Communication)

consisted of towns and villages, was reorganized as cities, towns, and villages in 1889. As a result of this reorganization, over 70,000 towns and villages were integrated into 39 cities, and 15,800 towns and villages. This reorganization aimed at developing municipalities' administrative basis in dealing with education, family registration, and taxation.

Second, after World War II, several laws were enacted for promoting municipality amalgamations; in 1953, the Towns and Villages Merger Law, and in 1956, the Law for Promoting the Establishment of New Municipalities. The number of municipalities was reduced to about 3,400 after this amalgamation.

Following these two waves, the "Heisei" amalgamation, the third wave, appeared as an initiative of the central government. To promote amalgamations, the Municipal Merger Law was renewed in 1995 as temporary legislation with a 10-year term limit. However, the Municipal Merger Law was amended in 1999 before the end of the term limit. With this amendment, the central government in Japan has strongly forged ahead with municipal amalgamation with the target number set at 1,000 municipalities.

However, in Japan, the central government cannot force a municipality to amalgamate with other municipalities because forced municipal amalgamation is considered as eroding the local autonomy which is constitutionally assured. As a result the central government promotes municipal amalgamations by relying mostly on fiscal method. The central government uses both carrots and sticks to encourage municipal amalgamations.

In the Major Heisei Amalgamations, the central government uses fiscal carrots and sticks. It actually tried to promote municipal amalgamation before the trinity reform. The central government revised the Special Low on the Merger of Municipalities in 1995 to promote municipal amalgamations by removing impediment for municipalities to amalgamate with other municipalities.

Furthermore, under the banner of decentralization reform in Japan in the 1990s, the central government delegated much more administrative power to municipalities. In the first stage of the reform, the Committee for the Promotion of Decentralization did not argue about municipality amalgamation, because it focused on terminating the agency-delegated functions. After the first stage, the argument of municipality amalgamations appeared in the policy-making process. In 1998, the 25th Local Government System Research Council published a final report about municipality amalgamations. In this report, the Council suggested that it is necessary to reinforce the residents' initiative and the role of prefectures in municipality amalgamations, in order to promote amalgamations. Following this report, the central government of Japan increased financial and administrative supports to municipalities. The Ministry of Home Affairs (MOHA) set the promotion of municipality amalgamation as the policy with overriding priority in local finance and administration. MOHA started to consider the pattern of amalgamation in each prefecture, to expand the residents' initiative, and to offer financial supports to prefectures which stimulate municipality amalgamations. In August 1999, MOHA requested prefectures to decide the plan for amalgamation which stipulates the pattern of amalgamations in each prefecture in the Road Map for the Promotion of Municipality Amalgamations.

However, as shown in the Fig. 6, the number of municipal amalgamations between 1995 and 1999 is just three even though the revision of law. In 1999, the central government revised the law again to promote more strongly the municipal amalgamation. In this revision, the central government introduced several special treatments for municipal amalgamation including residential initiative to introduce municipal amalgamation committee, fiscal support for municipalities to amalgamate with other municipalities, loosening the requirement to be a city, and making an exception on the term and number of municipal assembly members. In Japan, to be a city one municipality has to have more than 50,000 residents and meet other requirements on urbanization of municipality. However, in this revision, one municipality can be a city with more than 30,000 residents. This revision encourages towns

**Local Fiscal Reforms and Municipal Amalgamations in the 2000s in Japan, Fig. 6** Heisei Municipal Amalgamation (Source: Made by author based on the data available from Ministry of Internal Affairs and Communication. Thousand Yen)

and villages to amalgamate with other municipalities to be a city.

In addition, in 2000, the central government set the goal of the number of municipalities at 1000 after the promotion of municipal amalgamations in the Outline of Administrative Reform. Even after this revision the number of municipal amalgamation did not increase and there were only 11 cases between 1999 and 2002 (Fig. 6). To accomplish the goal set in the Outline of Administrative Reform, the central government needed to introduce further measures.

In this context, as described above, the Trinity Reform reduces the amount of fiscal transfer from the central to local governments and increasing tax resources of local governments by increasing the tax rate of residential tax. However, this promotes the fiscal gap among municipalities. Fiscally challenged municipalities which are mostly located in the country side cannot gather tax with residential tax because they have smaller population. On the other hand, wealthy municipalities which locate in urban area can tax more than before the reform from their residents.

This reform strongly promotes municipal amalgamations. Among three dimensions of reforms, the cut of local allocation tax force small municipalities which rely on it for their fiscal revenue to amalgamate with other municipalities (Kido and Nakamura 2008). The number of municipalities started to decrease from the year of 2004 just after the central government cut the fiscal transfer to local governments by the Trinity Reform. The number continued to decrease until it reached to about 1,700. As shown in Fig. 6, the number of town and village decreased significantly from 2,500 to 1,000, although the number of city increased slightly during the Heisei Amalgamation. This means that fiscally fragile small towns and villages amalgamate with surrounding municipalities and became a city.

## Conclusion

This section explains the Trinity Reform and Heisei Municipal Amalgamation in Japan in the 2000s.

First, the Koizumi Administration implemented local fiscal reform called "Trinity Reform" starting 2003 including three dimensions of reforms: reducing local allocation tax, subsidy, and increasing local tax. This reform changed the local fiscal system significantly that local governments are more independent from the central government in terms of fiscal resources. In particular, fiscally weak

municipalities have faced difficulties to manage their revenue because the tax resources are concentrated to urban area.

Second, as a result of trinity reform, the number of municipalities reduced significantly after 2003 when the central government started the reduction of fiscal transfer. The numbers was reduced to 1700 within just 5 years. This is the third wave of municipal amalgamations in Japan since the Meiji era.

As seen in this section, local government system in Japan has changed significantly in the 2000s. Therefore, it is necessary to examine what these institutional changes in Japan would cause political or public administrative outcomes. Japanese case will provide rich information for comparative public administration.

# Local Governance

Parvaz Azharul Huq
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Decentralization; Democratic local governance; Local government; Local self-government; New local governance; Participatory local governance

## Definition

Local governance is a new process of decision-making and resource distribution at the local levels using markets, quasi-markets, and the networks of mutually interdependent organizations, entities, and actors. This is a new form of governing system which transcends – both in theory and practice – the traditional conception of local government. While local government is a building block of local governance, the latter encompasses a wide gamut of formal and informal institutions, processes, and relationships. In its simplest form, local governance can be defined as the collective action of the local government institutions, various government agencies, private sector, and civil society groups to manage common socioeconomic and political affairs of a given locality below the national or sub-national level.

## Introduction

Local government, more specifically local self-government, refers to the kind of government bodies which are comprised of representatives elected by the people and have administrative, legislative, and executive authority and functions to discharge on the territories under their jurisdiction below the national or sub-national level. Local government institutions can be created by national constitutions, state constitutions, ordinary legislation of a higher level of central government, provincial or state legislation, or executive order (Shah and Shah 2006:1). On the other hand, local governance – as an extended and a reformed form of local government – denotes the formulation and execution of collective action at the local level. It underscores the need for looking beyond the narrow perspective of legal frameworks and local government institutions. As such, it refers to a consultative and collaborative process that replaces the traditional mode of decision-making by the officials behind the closed doors inside the local councils. Local governance seriously considers the changing circumstance of our time, for example, the change in the actor constellation in the public policy arena. It follows a horizontal consultative interactions among a wide range of public, private, and other societal actors in the process of the formulation and the implementation of policies. Local governance exhibits the perceived changes in the nature and role of the state following a major public-sector reform that took place between the 1980s and 1990s at the advent of the new worldwide social, political, and economic circumstances.

## The Increased Importance of Localism

Recently localism has received special attention both in political and academic arena. Harriss et al. (2004) convincingly outline how the current conception of localism is intertwined with and favorable to the process of globalization and the changing sociopolitical and economic circumstance since the 1990s. The complex process of globalization has been reinforcing the transformation of state power and politics in such a way that localization of politics has become an integral part of restructuring of nation-states. Globalization has integrated many of the nation-states into global networks, flows, and the global market. Global market forces together with the pressure of neoliberal discourses have forced many nation-states to undergo the processes of "de-statization" (e.g., market liberalization) and "denationalization" (e.g., decentralization, devolution, and privatization). As a result of the processes, the conception of "local" has assimilated a revived dimension in relation to global-local connectivity. According to Massey, "local" is "...a product of wider contacts; the local is always already a product in part of 'global' forces..." (Massey 1995:183). Local sites are no longer sealed off from relational and translocal linkages (broader networks). Simultaneously, the primacy of local-level politics has increased with a renewed identity in the context of global transformation (Harriss et al. 2004).

## The Shift from Local Government to Local Governance

This is not so long ago until when the state and government were used synonymously and interchangeably. Government was seen as the embodiment as well as exposition of state sovereignty (Cheema and Rondinelli 2007). It is the government who was solely responsible for articulating people's interests and providing services to them. Academic discussions and debates at that time revolved around what kind of economic plan was required to follow or what level of government remained more efficient and appropriate to deliver services. State interventions and control was thought to be the only solution to the problems and challenges the society had encountered at that time. Various basic services such as health, education, housing, etc. were considered as public goods, and those were the prerogative to the government as the main service provider. The postwar economic system in the western liberal democracies was very much influenced by the ideas of Keynes (1883–1946).

But by the early 1980s, the world witnessed a number of phenomenal changes in the political and economic spheres. Between the 1970s and 1990s, the world experienced the third wave of democratization partly because of the decreased legitimacy of the authoritarian regimes due to poor economic performance (Huntington 1991). Such widespread democratization process was followed by the collapse of Soviet Union at the beginning of the 1990s. This was a great blow to the idea of centrally planned economic system. The wave of prodemocratic transition along with technological development, especially in the field of ICT, acted as catalysts for the expansion of globalization throughout the world. One of the greatest consequences of globalization is the ever-increasing economic and political interdependence of the nation-states. Simultaneously, globalization has changed the nature of capital by emancipating its control from the state. The development of big multinational corporations, who are not loyal to a particular nation-state, is gradually taking the control of capital. Therefore, the world has witnessed the rise of a kind of private sector which is relatively free from rigorous state control. Again, the promotion of liberal democracy together with the forces of globalization (i.e., economic liberalization) contributed also to the proliferation of various private nonprofit organizations, nongovernmental organizations (NGOs), professional groups, faith-based groups, community-based organizations (CBOs), etc. not only in the western societies but also in the global south.

In the social sphere, both the developed and developing societies embraced quite a number of changes as well as challenges. Due to the concentration of major economic activities in a few geographical areas, the pace of human migration and urbanization has increased. The influx of migrants in a few urban centers has been resulted in ever-widening social segregation between the rich and poor, black and white, immigrants and locals, and so on. Providing employment, health, education, and other social services to the disadvantaged groups has appeared as a major challenge for the government. Again, because of the advancement of medical science, the life expectancy both in the developed and developing countries has increased. This has given the rise in the number of elderly population who requires special welfare system. In addition to these, the ever-increasing economic involvement of women demands for extending the coverage of child welfare system in order to support working parents. Moreover, while the technological development especially in the field of ICT has offered a number of opportunities for human well-being, it has also poised new kind of social problems, for example, cyber-crimes. Beside these, climate change-induced environmental degradation has appeared as a single most important threat against human existence. At the face of these diverse societal problems, the government's capacity as a single entity in addressing the challenges has been proved inadequate.

By the end of 1980s, the public policy arena became configured with a new constellation of actors beside the government. Gradually, big multinational corporations, private companies, professional organizations, nonprofit voluntary organizations, and community-based organizations entrenched into providing services like health, education, housing, etc. which was previously been considered as pure public goods and services. As such, the concept of "public" which was synonymous to government started to be replaced by a new kind of publicness which is shared by multiple stakeholders in the process of governing (Saito 2008). Accommodation of these new actors in the governing process called for a deep-rooted reform in the art of business of the government. According to Bevir (2009), the paradigm shift from government to governance took place in two waves: the first was aimed at incorporating business sector's management styles in the public sector which is known as New Public Management (NPM); the second wave was an attempt to develop new institutional arrangement for managing and coordinating the functions of a joined-up series of networks under the banner of "joined-up governance," "one-stop government" or "whole-of-government," etc. The shift is marked by the following: from public toward private forms of governance, from public toward forms of governance in which the civic society plays an important role, from central forms to decentralized forms, from national forms to

international and supranational forms, from geographical forms to functional forms, and from vertical to horizontal forms (Bekkers et al. 2007). Rhodes (1996) identifies a number of characteristics of governance: interdependence between organizations, continuous interactions among the network members, game-like interaction among the network participants, and a significant amount of autonomy from the state. In a nutshell, the shift entails a two-dimensional transformation for the local government institutions: from sole decision-makers to coordinators, collaborators, or co-governors and from service providers to enablers, coproducers, or partners.

## Local Governance and Decentralization

Local governance and decentralization are intricately related to each other, and at times these two concepts are used interchangeably. However, the two concepts are not the same. A well-planned decentralization is a prerequisite for successful transition from local government to local governance, but decentralization alone – even with its highest form "devolution" – may not lead to the development of a functional local governance system. Local governance is more than just simply decentralizing the administrative, legislative, and financial functions and authorities to the lower levels. The transition from government to governance depends much on various additional policies, programs, or strategies undertaken by various international, national, or local entities in creating an enabling environment at the local level to building, for example, strong civil society organizations, private sectors, well-functioning market, etc. More importantly it requires to redefine central-local relationship.

Generally, decentralization has been defined as "...the transfer of authority, responsibility, and resources – through deconcentration, delegation, or devolution – from the centre to lower levels of administration" (Cheema and Rondinelli 2007:1). In contrast to "deconcentration" and "delegation" which often refers to the shift of some administrative and managerial responsibilities and authorities to some government agencies at the lower levels, "devolution" (also known as democratic decentralization) is the transfer of significant power, authority (including lawmaking), and resources to the lower-level bodies, which are democratic in some way and to some degree (election or by some other means that induce local people's participation) and which are largely or wholly independent of higher levels of government (Conyers 1981; Manor 1999; Cheema and Rondinelli 2007). A promising decentralization, more specifically democratic decentralization, must entail a mixture of all three components, e.g., democratic, fiscal, and administrative (Harriss et al. 2004; Cheema and Rondinelli 2007).

Not always, but in most of the cases, decentralization has been the result of intentional decisions by the policymakers. Manor (1999) states that there are ample examples, i.e., South Africa, Namibia, the Philippines, Bolivia, some Indian states, and others, where decentralization was aimed at a genuine attempt to empowerment by promoting participatory local governance at the local level, tapping partnership between state and society, enhancing the accountability of elected representatives and transparency of the government, and so on. Contrary to this, he further mentions, decentralization could be advanced for narrow or partisan advantage and consolidating a local power base of the central government by drawing powerful figures at local level into official positions, obtaining local resources which the ruling party can exploit for partisan advantages, mobilizing voters, and so on.

## Local Governance and Citizen Participation

Various studies and writings indicate about the ineffectiveness of liberal democratic mechanisms both in the developed and developing countries, since the gap between ordinary people and the state institutions has been widening in many of those countries. The political representation system of electoral democracy seems to fail there in accomplishing some central ideas of democratic politics, like the active political participation of citizens, building consensus through dialogue, bringing equity, and so on (Fung and Wright

2003). Therefore, focus has turned to participatory mechanisms that are represented as extending and going beyond the limits of representative, electoral democracy. Though the concept of participation was not new in the local government sphere, it was relatively recently that the concept was increasingly being related to the right of citizenship and democratic governance. Since the 1990s, there has been growing interest around the world in involving citizens more directly in the governance process. This interest has given rise to new spaces for participation as well as new frames of participation under the concepts of "participatory governance," "citizenship participation," or "empowered participatory governance" (Fung and Wright 2003:5; Gaventa 2003:4). This new form of civic participation calls for a reconfiguration of relationships and responsibilities between the citizens and local state institutions through participation in the newly created spaces (Cornwall 2002).

Since the term governance by default implies wider participation in decision-making by accepting a wide range of actors other than the state, it may be described as more or less participatory depending on the level of influence of the non-state actors. The degree and type of involvement of different actors in governance, therefore, particularly depends upon the relationships among them, as well as on the role and attitudes of each actor. But when we talk about a well-designed participatory local governance system, it combines a true representative democratic system at the local level as well as the scope for direct citizen participation in the decision-making and implementation process related to the local issues for making local government more responsive and more effective in service delivery. As such, participatory local governance is about readjusting the traditional boundaries and building a new relationship between the state and citizen by creating intermediary spaces – new forms of social and political associations – where participants from both sides can interact in a new way. Participatory governance refers to an approach toward citizen participation beyond the electoral process and which draws on community participation in identifying local priorities and planning and implementing programs, whereby citizens become "makers and shapers" (Cornwall and Gaventa 2000).

One of the main focuses of participatory local governance is the inclusion of poor and marginalized people. In this way, it is different from good governance where participation in decision-making is an element among others to run government businesses (Satterthwaite et al. 2005). For Schneider (1999) participatory governance in the context of poverty reduction means to empower the poor. Participatory governance, thus, aims for greater, broader, and deeper participation. It does mean that the increased relationship between governments and citizens goes beyond the participation within a specific project, neighborhood, and policy. Participation in a specific project or neighborhood – even though in such practices government officials or elected local representatives and citizens are tied in the decision-making process – could be a sign of good governance, but not participatory governance. Bishop and Davis (2002:27) identify the elements of participation in a participatory governance process: a measure of citizen involvement in decisions that might otherwise be the sole prerogative of executive government or elected representatives, a commitment to seek the views of those affected by a decision, some transfer of authority from government to citizens, and a transparent process which ensures citizens are informed about policy processes.

## Conclusion

To conclude, the global shift from local government to local governance can be seen as a transformation of the governing process from monocentric to a polycentric system where multiple actors interact with each other in order to realize their common interests. Although local governance has a locality-based focus, the process has a strong translocal linkage. Therefore, it often transcends a specific geographical location or policy arena. The recent thrust of the changes toward local governance is not only about to bringing efficiency in the public sphere but also to

promoting democratic values and social inclusion at the wider societal level.

## Synonyms

Grassroots governance; Leadership; Local government; Municipal government; Social services

## Definitions

**Local Governance:** This refers to the provision of political leadership to the people at the local/grassroots level. It implies the act whereby institutions of government make policies and provide public goods to the people at the local level.

**Public Service:** This refers to the entirety of services made available to citizens by the government and it is usually not for profit-making purposes.

**Service Delivery:** This implies the provision of certain services to a given people over a period

L

of time. It is the provision of healthcare, sanitation and water services, electricity supply, among others, to a group of people.

## Introduction

Across the African continent, governance at the local levels is as devastating as what is tenable at the national level, sometimes, even worse. While national governments have bulk of the responsibility to ensure the welfare of citizens, it is however correct that local governance structures are the closest to the people. As such, it is ordinarily expected that those at the helm of affairs at the local level of governance owe the people at that local level a good and quality life. They can provide this by way of qualitative and quantitative public service delivery to the people at the grassroots. While providing such public services is important, ensuring that the people for which these services are meant have uninterrupted and unlimited access to them is paramount. It, therefore, behooves of those at local level of governance to ensure public service delivery and actual access to these services.

The responsibility of providing quality governance and essential services to the people at the grassroots has been placed on local governments in most parts of Africa (Nwoba 2015). Such essential public services include, but are by no means limited to, primary healthcare services, quality education, security, sanitation services, safe drinking water, and reliable electricity, among others. In Western Africa, the condition of local governance and public service delivery is not different. Public goods and services still vary largely in terms of quality and quantity across developing countries (World Bank 2004).

Nigeria operates a federal structure with 36 states and 774 local government councils. Given this structure, local governments are the closest to the people. Ghana operates a unitary structure with 16 regions, 228 districts, 792 councils, and over 16,000 unit committees at the smallest level of administration closest to the people. In Nigeria, citizens hardly have access to reliable electricity, good roads, safe drinking water, quality primary healthcare services, security, and quality public schools, among others. Often times, citizens have become government for themselves with little or no help from the state, especially from local level. Where some are available, quality and access continue to constitute major challenges. Even though a little progress has been made over the years, the question of quality, quantity, and access persist in Nigeria. Conversely, despite the public–private partnership on public service delivery meant to improve quality and access to public service in the country, Ghanaians continue to face difficulty accessing essential public services due to lack of facilities or service shortage in quality and quantity (Armah-Attoh 2015: 3). Nonetheless, Ghana has perhaps made a little progress over Nigeria, but this fact has not exonerated the country from the general poor local governance and public service delivery ravaging the African continent.

Ghana and Nigeria could be regarded as leaders in the West African subregion, given their economic and political prowess. This justifies the choice of the countries for this entry. The entry thus compares Ghana and Nigeria on the basis of local governance and public service delivery. This is with the view to open up more comparative grounds for the countries and find a common local governance and public service delivery challenge (s) associated with the countries, West African subregion, and, by extension, Africa. By comparing the countries, the entry provides the opportunity for lessons to be learnt from both countries, while the country lagging behind can adopt methods from the one which has made significant progress over time. The entry also proffers way forward to address local governance and public service delivery challenges in the countries.

Following this introduction, section 4 presents the evolution of local governance in Ghana and Nigeria. Section 5 is on the state of local governance and public service delivery in Ghana and Nigeria; section 6 is on access to public services in the countries. Section 7 gives the concluding remarks.

## Evolution of Local Governance in Ghana and Nigeria

As early as 1982, the decentralization that was put in place by the Provisional National Defense Council (PNDC) had given rise to the local government structure in Ghana (Ahwoi 2010). This made provision for four-tier governance structure of regional, district, area, and town/village councils. In 1988, the LG Law 207 ensured that political, fiscal, and administrative powers were extended to the local and subnational structures. The LG Law 207 explicitly outlined the functions and responsibilities of each structures at the local governance level. With the draft of the 1992 Constitution of the Republic of Ghana, local governance was further enshrined and consolidated in the constitution. The 1992 constitution further consolidated the provisions of LG Law 207 and the two documents have since served the foundation of local governance in Ghana to date. All other policy guidelines and legislations on local governance in Ghana have derived from either LG Law 207 or the 1992 constitution, or both.

In Nigeria, local governance predated the colonial administration in the country. Long before the colonial masters established their colony in Nigeria, the country had local governance structures in place and these structures delivered essential services to the people. The evolution of local governance in Nigeria could be explained in three different epochs – the precolonial, colonial, and postcolonial era (Agba et al. 2013). During the precolonial period, local governance was delivered to the people via traditional systems uniquely designed by each ethnic group. The traditional systems thus acted as local governments and provided basic services to their people.

During the colonial period, the colonial administrators met a working local governance structure on ground, hence, only needed to improve on them to achieve better efficiency. As such, they made use of native authorities. The native authorities were merely a rephrase of traditional systems as they were not different from their predecessor – traditional systems in terms of roles and functions. At the end of colonial rule in Nigeria, the regions resorted to their unique mode of local governance, with some retaining the traditional systems, some switching to elections of local authorities, while others relied on both systems. In 1976, there was a major reform in the local government and governance structure in Nigeria. Local government became officially and constitutionally recognized as the third tier of government and enshrined for the first time in the 1979 constitution of the Federal Republic of Nigeria. The 1979 constitution, thus, spelt out the role of local government in Nigeria. This was also replicated in the 1999 constitution (as amended).

## The State of Local Governance and Public Service Delivery in Ghana and Nigeria

The provision of public services to Ghanaians is a constitutional responsibility of the different levels of government from national to the local level of governance structure. Even though the national government retains the policy-making power over service delivery, the responsibility to provide facilities and implement such public service delivery policies is shared. The fact that local governments are closer to the people makes them more accountable to the people and are thus held responsible to bring essential services to the people. This is especially true for people at the grassroots. Therefore, while the Ghanaian Assemblies are responsible for the provision of basic education, the districts are responsible for sanitation services, public healthcare delivery, and environmental protection services. To achieve the Sustainable Development Goals (SDGs) in Ghana, the country has incorporated the SDGs into its national development – the Ghana shared Growth and Development Agenda (GSGDA) (Government of Ghana n.d.). This agenda is expected to be vigorously pursued by all the assemblies at the metropolitan, municipal, and district levels of the country. This has, to a long extent, impacted on service delivery to the grassroots in Ghana.

Like its other African counterparts, local governance and public service delivery still face critical challenges in Ghana. Owing to scarce resources and the rapidly growing population,

urbanization, and development, public service delivery faces even greater challenges in the country (Armah-Attoh 2015). To address this growing challenge, Ghana has explored the public–private partnership on the task of public service delivery. While this approach may come to the rescue of government, the reality is often that citizens may be at the receiving end of profit-seeking private sector service providers. This justifies, also, the skepticism and apprehension among Ghanaians on the prospects of the private profit-seeking sector to provide essential services to the public without exploiting them. The implication of this, therefore, is that while Ghanaians may enjoy better quality services and higher quantity of these services, they may have to pay more. This approach somewhat delegates government responsibility to private individuals and firms. Despite this development, Ghanaians continue to have difficulties accessing quality public services (Armah-Attoh 2015: 2).

As of 2014, most Ghanaians were not satisfied with the state of public service delivery in the country. That year, 70% of Ghanaians claimed that the local government was performing "badly" or "very badly" in local road maintenance, while 75% were dissatisfied with the provision of reliable electricity. With respect to maintenance of roads and bridges, providing water and sanitation services, addressing education needs, and improving basic healthcare services, 68%, 66%, 63%, and 61% of Ghanaians respectively feel government was performing "badly" or "very badly" (Afrobarometer 2014/2015). Nevertheless, there has been significant improvement on public service delivery in Ghana over the space of 4 years. For instance, in 2018, only 23.4% of Ghanaians were dissatisfied with reliable electricity supply, while 41% rate the maintenance of roads and bridges as "very bad" or "fairly bad." With respect to provision of water and sanitation services, addressing education needs, and improving basic healthcare, only 33.6%, 17.2%, and 28.9% of Ghanaians, respectively, feel that public service in these areas are in a "very bad" or "fairly bad" state (Afrobarometer 2016/2018). These more recent ratings show significant improvements in public service delivery in Ghana over the space of 4 years.

On the general performance of local governments in Ghana, Ghanaians' rating of performance at local government level and delivery of public services had witnessed improvement, signaling significant improvement in local governance and public service delivery in Ghana over the years. While 58% of Ghanaians "strongly disapprove" or "disapprove" of local government performance in 2014, by 2018 the percentage of such perception had dropped significantly to 33.8% (Afrobarometer 2014a/2015a, 2016a/2018a).

In Nigeria, local government is also the closest to the people and is, thus, expected to provide governance and public services to the people, especially at the grassroots. Albeit, there seems to be widespread perception and evidences over the years that local government has performed abysmally with respect to public service delivery (Obasanjo 2003). While the central and state governments legislate on most aspects of public affairs in Nigeria, local governments are, however, mandated to provide basic public services to the people, especially at the grassroots. Such services may include the provision of safe drinking water, maintenance of local markets and motor parks, maintenance of local roads, construction of primary healthcare centers and primary education, and provision of basic healthcare services, among others. Like in other parts of Africa, local governance and public service delivery have remained in a significantly poor state in Nigeria, with only a little progress made over the years.

Since independence in 1960, governance and public service delivery have consistently worsened in the country and many citizens have already lost hope and confidence on the government's ability to provide these basic essential services. Hence, most Nigerians have resorted to patronizing private sector for their security, health, and education services, among others. This development has no doubt reduced the value citizens place on government and public services in Nigeria. There continues to be dwindling trust among Nigerians toward government's ability to provide quality governance and provide essential services (Mimiko 2018).

What it seems Nigerians have accepted is the slogan "all man for himself," a dictum which completely removes the existence of and relevance of government/governance. The people essentially do not feel government's existence because the public services which are meant to keep the essence and importance of government alive are largely missing, leaving citizens to fend and struggle for themselves.

Quality remains a challenge with public service delivery where they are existent in Nigeria. Where public services are available, they are often grossly inadequate both in terms of quantity and quality. Local governments have failed to come to the rescue of the people at the grassroots. This neglect at the local level continues to manifest in poor environmental state; dilapidated school, healthcare, and market facilities/buildings; poor healthcare centers (Olusola 2011: 337); bad conditions of local roads; no or inadequate reliable electricity supply and lack of access to safe drinking water in most rural areas where local governments are meant to be most evident. Some challenges with local governments and public service delivery in Nigeria include institutionalized corruption, political instability over the past years by way of military intervention in politics, eroded local government autonomy, and controversial/confrontational state–local government relations. Others include inadequate local government funding, unprofessionalism of local government administrators, and poor work ethics among those in government, among others.

Citizens' rating of local governance and public service delivery in Nigeria over a period of 4 years shows only a little and insignificant improvement. For instance, in 2014, 68% of Nigerians were dissatisfied with the state of electricity supply in the country, while 59.8% felt the maintenance of roads and bridges were handled "very badly" or "fairly badly." With respect to provision of water and sanitation services, 64.4% of Nigerians rated it "very badly" or "fairly badly" and 51.8% felt dissatisfied with government's handling of improving basic healthcare services (Afrobarometer 2014/2015). Four years later, only a little or no improvements were recorded. In 2018, 63.3% of Nigerians still felt the government was performing "fairly badly" or "very badly" with respect to reliable electricity supply; and 59.3% still rated provision of water and sanitation services as "fairly bad" or "very bad." While other aspects witnessed only a little, yet, poor performance, other areas only experienced a leap frog improvement. With respect to maintenance of road, fewer citizens (46.7%) rated government as performing "fairly badly" or "very badly," while 48.6% felt government was doing "fairly badly" or "very badly" with respect to meeting education needs of citizens (Afrobarometer 2016/2018). Also, among ten selected public services in the country, only four were rated as being in "good" state, while others were rated "poor" (Idowu 2019).

On the general performance of local governments, in 2014, most Nigerians (63.1%) "strongly disapprove" or "disapprove" good performance, and 62.8% still held the same perception 4 years later in 2018 (Afrobarometer 2014b/2015b, 2016b/2018b). To date, not much has changed in terms of local governance and public service delivery in Nigeria.

## The Question of Access to Public Services in Ghana and Nigeria

While the availability of public services is important, even more important is how easily accessible these services are to the people they are meant to serve. Access to basic public services are the citizens' right and must never be treated as a privilege (Ofori-Mensah 2017). Albeit, accessing public services in Africa still remains a major challenge, with citizens having to pay extra as kickbacks at times to gain access to such services. Besides the aforementioned is the question of timing – the amount of time it takes before citizens can gain access to public services, in the case that they are able to gain access. These remain a critical challenge in Africa, Ghana, and Nigeria inclusive. While this is a general challenge, the degree may differ significantly across board. Evidences show that Ghana is ahead of Nigeria in this regard, however, with only a slight difference, as access still constitutes a serious challenge to public service delivery in both countries.

While much remains to be done, the fact cannot be denied that Ghana has made some progress on access to public services. Prominent achievement by Ghana is the halving of the percentage of the population without access to safe drinking water (Ofori-Mensah 2017). Despite this feat, rural dwellers still suffer significantly from limited access to water (safe drinking water and water for general use). Ghanaians rate access to medical care in Ghana compared to a few years ago as "much worse" or "worse" (14.1%). While 36.6% claim it is "better" or "much better," 44.9% Ghanaians aver that nothing has changed over the past few years. On ease of access, while only 3.2% Ghanaians aver that it is "very easy" or "easy" to obtain household services, 9.2% claim it is "difficult" or "very difficult." Whereas 24.5% of Ghanaians posit that it is "easy" or "very easy" to obtain medical treatment in public hospitals, 19.1% say it is "difficult" or "very difficult" to obtain medical treatment (Afrobarometer 2016/2018).

Access to public services in Nigeria is not much different from what is obtainable in Ghana. While the fact is not only that public services are grossly inadequate to rural dwellers, with urban dwellers having more access, in Nigeria, access is also skewed to favor the rich and influential in society. As such, in an environment of grossly scarce resources, the rich and influential get the best of the services there exist, ahead of ordinary masses and the poor. Also, citizens often need to make some extra "unofficial" payments in order to gain access to certain public services in Nigeria. Where citizens are not able to bear this extra cost, they are often denied access. Access to health facilities, safe drinking water, and other household services remains a challenge, especially for the poor, middle class, and rural dwellers in Nigeria.

Access to medical care in Nigeria, compared to a few years ago, shows that 31.4% of Nigerians say it is "much worse" or "worse," while 34.9% claim it is "better" or "much better," and 33.4% aver that nothing has changed over the years. With respect to ease of access, only 13.1% of Nigerians posit that it is "very easy" or "easy" to obtain household services, while 19% say it is "very difficult" or "difficult" to obtain such services. On ease of access to medical treatment from public health facilities, 22.5% Nigerians claim it is "very easy" or "easy" to obtain medical treatment from a public facility, while 17% claim it is "difficult" or "very difficult" to obtain medical treatment from a public facility (Afrobarometer 2016/2018).

## Conclusion

The entry has been able to show in a systematic manner, the state of local governance and public service delivery in Ghana and Nigeria. While it is not disputable that the state of local governance and public service delivery remain generally in poor conditions across the African continent, and, indeed Ghana and Nigeria; nonetheless, Ghana has made some significant progress in these aspects over a period of time. While Nigeria has not remained stagnant either, progress made in local governance and public service delivery has been quite slow and insignificant. Conversely, ease of access to public services in the two countries is similar and poor, with the poor and rural dwellers significantly marginalized. Governments in Ghana and Nigeria, and, indeed, the entire African continent must do more to improve on local governance and public service delivery and ease of access to these services where available. This is the only way the so much desired development can be achieved on the continent.

# Local Governance in the Caribbean

Bishnu Ragoonath
Department of Political Science, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Local Government; Local Governance; Decentralization

## Definition

Whereas the concept "local government" is normally well understood as a subnational level of government which has jurisdiction over the administration of a limited range of public or state functions, within a specified geographical area, local governance, from a Caribbean perspective, proposes to be those processes and the institutional framework within a locality or community through which power and authority are exercised, in influencing policy, decision-making and implementation regarding the conduct of local public affairs, and the direction of local development.

## Introduction

Most Commonwealth Caribbean states, during the colonial period under British rule, had systems of local government. With independence, however, national governments reevaluated the efficacy of the existing local government systems. The result was that some states retained a system of local government, while others reformed the local government systems, ensuring that they were no longer subnational governmental authorities, but rather became administering arms of the central government, while in other states, the systems were simply abolished and all functions transferred to central government. Such reforms have ensured that there is no uniform local government configuration within the Caribbean region. But based on the reforms adopted, several states claim to have created systems of local governance. This entry critically reviews this claim.

Local governance from a Caribbean perspective is supposed to represent a combination of three compound ideals, namely, democracy, public management, and development. In terms of democracy, governance expands on the narrow meanings of democracy, so much so that legitimacy of governments based on free and fair elections are inadequate in the modern conceptualization of governance. Governance thus is to represent consensus building, participation, and civic awareness. It is also pegged with the

principles of integrity and morality in the execution of public affairs to the end of achieving social and economic development.

The concerns with social and economic development, within the context of governance, are ones where people and more critically peopled-centered policies are the primary focus of government. Development is not here to be seen in the context of infrastructural or economic growth, but rather it is geared toward improving the social, economic, political, cultural, and even psychological quality of life of the citizenry, integrating them into the society while at the same time empowering them to live fulfilled lives. Empowerment here must include the right to participate fully in the decision-making process as it affects one's life, as well as to have economic and social security. To be sure, governance from a developmental perspective puts people first, whereby policies and processes are to be people focused.

But in putting people first, governments, operating under the umbrella of governance, must operationalize its activities with a public management focus. The public management focus of governance is based on strong principles of management including proper human resource management as well as strategic management. In fact within the context of governance, governments with the consensus of the citizenry must determine developmental goals and purposes and design and implement systems to pursue such. Proper management principles and practices inclusive of accountability, transparency, integrity, and even morality must be adopted and instituted in the quest to achieve total quality management within the context of governance.

Local governance in the Caribbean therefore is to be measured in relation to the pursuit of democracy, development, and good public management. Cognizant that different states approached local governance differently, any understanding and analysis of local governance must start from an understanding of what exist on the ground, country by country. The next section of this entry reviews the current configuration of local governance from a country by country basis. This will be followed by an assessment of these systems based on the issues of development democracy and public management. The enrty will then focus on critical issues and challenges to local governance in the Caribbean.

## Local Governance and/or Local Government in the Caribbean

**Antigua and Barbuda** Local governance in the twin island state of Antigua and Barbuda epitomizes the lack of uniformity in local governance. The island of Barbuda has a constitutionally entrenched elected Council of Barbuda which acts as the authority for that island and can draft resolutions concerning community issues and domestic affairs. However on the island of Antigua, there are no such local governance systems. The Ministry of Social Transformation and Human Resource Development however has a local government department which has the responsibility for reviewing and making recommendations for local government reform. There are currently no district/parish/community councils in Antigua, but there seems to be a long-term aim of establishing district councils throughout that island.

**The Bahamas** Local government was introduced in the Bahamas in 1996 and exists in all inhabited islands with the exception of New Providence (where the capital city is located and for which local issues are administered directly by central government). There are thirty two (32) local government districts in the "Family Islands."

**Barbados** The system of local government which existed in Barbados prior to that country gaining its independence from Britain was abolished in 1968. Since then there is no official local government system. Local governance however is said to be implemented via a voluntary Constituency Council system. There are 30 councils existing in Barbados. These councils assist in managing resources assigned for the development of their respective constituency. The councils also serve as a conduit for information from the community to the central government.

**Belize** Although a 2009 national policy on local governance was approved for Belize, the

**Local Governance in the Caribbean, Table 1** Status of local governance systems in the Caribbean

| Entire island as a local government system (elected) | Constitutional/legal local government system (elected) | Local governance system (central government-appointed councils) | No local government nor informal local governance structures |
|---|---|---|---|
| Barbuda | Bahamas | Barbados (Constituency Council) | Antigua |
| Nevis | Belize | St Lucia | Grenada |
| Tobago | Dominica | | St. Kitts |
| | Guyana | | St. Vincent |
| | Jamaica | | |
| | Trinidad | | |

fact remains that this local governance policy was to provide guidance and direction for the systems and practices of local government. Local government is implemented in Belize through four types of local authorities, namely, the city councils, town councils, community councils, and the alcaldes. There are two (2) city councils (Belize and Belmopan) and seven (7) town councils which encompass the urban population within six (6) administrative districts of the country. Additionally, there are one hundred and eighty (180) villages and twelve (12) community councils. The alcalde system operates alongside the village councils and acts as local magistrates at the village and community level.

**Dominica** The current local government system in Dominica is said to have started during the colonial era. Today the local government system comprises three municipal councils, the Carib Council, and thirty seven (37) village councils. While all these councils are elected, it may be noted that the central government has the right to nominate at least 3 members of 8 on all village councils and 5 members for 13 of each municipal council. Through its nominative capacity, the central government can heavily influence the local government system and its functioning.

**Grenada** For over one hundred (100) years, Grenada had a formal local government system and included a Commission for Local Government. However, over time the entire system was dismantled. Currently there is no existing local government system in Grenada. It may be instructive to note that the Constitution of Grenada does state "that there shall be a council for Carriacou and Petite Martinique which shall be the principal organ of local government." As stated above no such system is however in place.

**Guyana** The constitution provides for a local government system which divides the country into ten administrative regions, each having a Regional Democratic Council headed by a regional chairman. Additionally there are six (6) municipalities and sixty-five (65) Neighbourhood Democratic Councils (NDC). The Amerindian Act also established local governance councils for Amerindian settlements.

**Jamaica** Local government in Jamaica dates back to 1662. The current system of local government consists of fourteen (14) local authorities comprising twelve (12) parish councils, one (1) municipal authority (Kingston and St. Andrew), and one (1) municipality – Portsmore. Parish Development Committees (PDCs), representing civil society, community-based organizations, and the private sector and including the local and central government agencies, have been established in all local government jurisdictions. The role of these committees is to facilitate the participation of local stakeholders in the management of local affairs and to guide local development through the preparation and implementation of parish development plans.

**St. Kitts and Nevis** Local government does not exist in St. Kitts. In Nevis however, there is a constitutional provision for extensive local autonomy. Nevis is considered as a devolved local government administration of St. Kitts and Nevis. It has complete autonomy with constitutional provisions for secession.

**St. Lucia** Elected local government was suspended in St. Lucia in 1979. At that time, local government was operationalized through eleven (11) local authorities operating as a city council (Castries), town councils (3), and village councils (7). In 2012 the Constituency Council Act was passed creating 15 Constituency Councils. The Constituency Council Act, 2012, makes provision for community involvement in local authority decision-making. A Local Authorities Bill has since been drafted to replace the current Constituency Councils. This proposed legislation will address issues relating to the institutional, financial, and legislative frameworks of local authorities. All local government functions however are centrally administered.

**St. Vincent and the Grenadines** Until its dissolution in 1973, a local government system comprising twelve (12) elected councils existed in St. Vincent and the Grenadines. Since then, the central government administers limited local government services through "local authorities" which are really deconcentrated central government structures. In 2002, Parliament passed a resolution to appoint a Commission on Local Government Reform to examine the existing arrangements and make appropriate recommendations for the establishment of democratic local government. A proposal to include local government in the constitution failed when the draft constitution did not receive the support of the people in a referendum held in 2009.

**Trinidad and Tobago** The reform of the local government system in Trinidad and Tobago has been under consideration for more than a decade. To be sure since 2004, there have been two Green Papers and one White Paper proposing reforms for local government in Trinidad, while there have been proposals for the reform of the Tobago House of Assembly in 2012–2013. In all instances, however, after extensive consultations with the citizenry, there have been no changes to the systems of local governance which existed since the 1990s. Notwithstanding that however, in Trinidad the Municipal Corporations Act of 1990 ensures that there is a system of elected local government for 14 municipal corporations in Trinidad, while the 1996 Tobago House of Assembly Act provides similar coverage for Tobago.

## Democracy in Caribbean Local Governance

Democracy, from the Caribbean local governance perspective, should represent consensus building, participation, and civic awareness. While elections are normally viewed as being an integral part of good governance systems, at least in two Caribbean states, the central government has refrained from including elections in their local governance models. Moreover, in the states where there are no formal or informal local governance structures, discussions on local government/governance reform seem to settle more toward the viewpoint against elections at the local level.

Until 1979 the St. Lucia local government system included elected local government councils. Since then there has been no elections although there have been reforms and even the expansion of the local governance systems with the establishment of new local government authorities within the ten administrative quarters into which the island is divided. The central government ministry with responsibility for local government normally consults civil society organizations, and the names of individuals are identified and recommended to the minister who then seeks Cabinet approval for the appointment of members of the local government councils. But even with a council being appointed, the minister assumes overall responsibility for policy formulation and direction of the local councils. Citizen participation, consensus building, and civic awareness in this system are thus limited in accordance with the ministry's consultation with civil society organizations and the minister's wishes.

A near similar state of affairs exists in Barbados. In this instance however, citizens can apply to the central government to be appointed to the Constituency Councils, and the minister makes the required appointments. Cleary this situation does not empower citizens. In both these cases however, there is the claim that the persons appointed can promote consensus building in the

community, and by extension there is the further claim that the system is not dogged by party or "tribal" politics. These claims are not always upheld by the supporters of the parties which do not hold central government. Be that as it may, there seems to be a genuine fear of electoral "tribal" politics in countries which promote local governance as opposed to local government. In fact it is this fear which the Prime Minister of St. Vincent and the Grenadines has expressed as his rationale for not supporting the recommendation from the Commission on Local Government Reform for elected local government in that country.

Turning to the democracy and participation in countries where there still exist local government systems, again there is no uniformity. To be sure, apart from the island systems where voter turnout at local government polls exceeds two thirds of the electorate, most of the other local government systems receive a failing grade for participation and democracy. Starting with the case of Guyana, since that country gained independence, there have only been three local government polls (1968, 1974, and 2016). Effectively, only in the Bahamas, Belize, Dominica, Jamaica, and Trinidad and Tobago have there been "regular" elections. But in suggesting that there have been regular local government elections, voter turnout at local government polls has been low. In fact in 2012 in Jamaica, the turnout was 34%. In 2013, in Trinidad, turnout at the local government polls was 43.6% of the electorate. In 2016, in Guyana, 47.1% of the electorate voted in the local government elections. Also in 2016, in Dominica turnout has been less than 20%. Elections are scheduled to be held in both Jamaica and Trinidad and Tobago on November 28, 2016. Based on the existing trends and political environment in both states, a low poll is again expected. Accordingly, only Belize can boast of a turnout at municipal elections of over 50% of the electorate. From the perspective of voter participation, the local governance systems in the Caribbean leave a lot to be desired.

As indicated above in the systems where the entire island is considered a single local government structure, voter turnout had been relatively high. In Barbuda turnout at the last local governance poll rested at 82% of the electorate. In Nevis it was 81%, while in Tobago it was 70%.

A point must be noted about democracy and Caribbean Local Governance. Party politics dominates the political culture in every country in the region. To this end, local government elections seem never to focus on the community, but rather on political issues as identified by political parties. This is most visibly seen in the case of Dominica, whereupon while the system calls for nonpartisan local government elections, the political parties are always integrally involved in the nomination of candidates and in mobilizing popular support, and at the end of the polls, "parties" claim victories.

## Development and Good Public Management via Local Governance Systems

Development is supposedly the most viable selling point for the retention of local governance systems in the Caribbean. To be sure, the true role of local government, even from colonial times, was supposed to be development oriented. Local government systems were supposed to be a training ground for politicians, facilitating them with a forum for debate and advocacy. The functions of local government were all expected to have a developmental result. Thus, for instance, the building and maintenance of markets allow for economic trade as well as a sanitary environment for the sale of food. Similarly maintaining parks and playgrounds and public spaces is supposed to create the enabling environment for healthy lifestyles. Effectively, in a strong local government/governance system, all the functions provided by a local authority are supposed to aid the development of the human person in the community. Of course this only happens with good management systems (be it human resource, financial, and project) being utilized.

In the Caribbean however, as noted earlier, local government and governance systems are very weak. Moreover, executive local government systems exist only in the Bahamas, Barbuda,

Belize, Dominica, Guyana, Jamaica, Nevis, and Trinidad and Tobago, and even in these states the local governance systems are heavily restricted in what they do. In Dominica, for instance, the village councils have road maintenance as the primary function. In the other territories alongside the road maintenance function, local governments oversee the maintenance of markets, waste collection and disposal, and in some instances public health and even child welfare. Effectively there is no uniform list of functions that local government systems undertake, though whatever is done can be said to have a developmental impact on the citizenry.

The challenge however has always been ensuring effectiveness, efficiency, and economy in embarking on the work of the local government authorities as well as in minimizing corruption. These issues become important since most local authorities are not financially autonomous and depend on central government for subventions, which are usually inadequate, as well as staff to implement their limited functions. The effect of all of this combined is that local government systems in the Caribbean region seem to fail at ensuring good public management. From this perspective, local governance in the Caribbean seems to be unable to meet what may be considered to be fundamental objectives for any local governance system.

## Conclusion

Although several Caribbean states have stayed on the local governance bandwagon, the fact remains that the systems in place are merely shadows of what a good local governance system should be like. Several central governments have agreed that there is urgent need to reform, but the reform agenda seems to be pegged on electoral victories either for central government or local government. Be that as it may, the lobby for local governance and more critically elected local government remains strong among the citizenry in the Caribbean. Whether central governments will adhere to the wishes of the people, we can only wait and see.

# Local Government Benchmarking

Nuno F. da Cruz
LSE Cities, London School of Economics and Political Science, London, UK

## Synonyms

Comparison; Indicators; Measurement; Monitoring; Municipal performance

## Definition

Benchmarking is the systematic comparison of certain performance measures with predefined reference levels, aiming at continuous improvement.

## Introduction

The various facets of "measurement," "comparison," "evaluation," and "monitoring" of government performance stubbornly continue to be topics of international relevance. Within this context, debates focusing on the subnational level of governance have been claiming more and more space in the academic and policy arenas. The extra attention given to the "local" is easier to explain. The decisions and actions of local executives have a very real and immediate impact on people's lives. Local governments are the closest link to the State for the majority of the world population. They are responsible for crucial policy sectors such as spatial planning, transport, and utility services and are also the enablers of many social and cultural activities (LSE Cities 2016). While most people already lives in cities, urbanization trends will continue to put strain, but also relevance, on local government institutions around the globe. In fact, the decentralization of powers from nation states to local governments can currently be observed across jurisdictions.

The endless debate about the advantages *versus* the perverse effects of assessing the performance of local governments and their institutions, on the other hand, is not so easy to encapsulate. Advocates, on the one hand, claim that local government benchmarking (the concept is discussed in the following section) is an absolute necessity, at least if one wishes to have effective and efficient public services (and public servants!), and that measuring, comparing, and monitoring performance are the only true way of making local governments transparent and accountable. Detractors, on the other hand, argue that these initiatives are generally naïve about the reality, open to manipulation and disguise methodological and technical limitations that ultimately lead to unfair results and pernicious governance impacts. As it often turns out, both sides of this debate are right in many of their assertions but perhaps exaggerate on the potential or the inevitable doom of local government benchmarking.

It is true that most local benchmarking initiatives do not acknowledge the inherent politics of the indicators used to measure and compare performance. As Kitchin et al. (2015, p. 6) emphasize, local government benchmarking systems are "complex, politically-infused, sociotechnical systems that, rather than reflecting cities, actively frame and produce them." However, most critical voices did not spawn from this theoretical and very sensible critique. In many ways, the major backlash against local government benchmarking stems from the fact that performance measurement was a central piece of the – now widely discredited – new public management (NPM) paradigm.

The UK was a frontrunner in the widespread adoption of these practices at the local level. The creation of the Audit Commission in 1982 and subsequent programs such as the Comprehensive Performance Assessment (introduced in England in 2002, revised in 2005), the Comprehensive Area Assessment (introduced in England in 2008), the Scottish Best Value Audits (introduced in 2003 and revised in 2009), and the Wales Programme for Improvement (replaced the Best Value regime in 2002) were all clear indications of this NPM approach to local governance (da Cruz and Marques 2014). Although the details and effects of these developments varied considerably, the mandatory and coercive nature of the initiatives was the predominant attitude.

Following the British example, similar programs were implemented in many other countries during the 1980s and 1990s. However, the compulsory benchmarking initiatives were slowly replaced by voluntary schemes. The initial motivations behind the intention to measure and compare local government performance were service failures that eroded the confidence of citizens and of higher tiers of government in the capacity of local authorities to deliver. The problem is that the "cure" that was generally proposed to overcome the service shortcomings was broadly inadequate. In simple terms, NPM supporters called for the inclusion of private sector practices into public sector entities. Benchmarking itself has its origins in the private sector (da Cruz and Marques 2014; Ammons and Roenigk 2015). However, as time showed, governments and public sector entities are much more intricate than private companies.

The mission, objectives, incentives, rules, and regulations that characterize public or governmental bodies as well as their history, longevity, and crucial role in society make them very peculiar. For all these reasons, the simple/direct import of private sector practices to the public sphere was destined to failure.

On several occasions, the counterreaction to the NPM legacy and first wave of benchmarking initiatives has been to categorize all contemporary indicator, dashboard, or other performance measurement schemes as taking a neoliberal approach to local governance. To be fair, any technocratic apparatus developed with the supposed intent of completely removing political discretion from the equation – or with grand claims about its capacity to show localities as they really are and even single-handedly solve local problems and facilitate more efficient and effective governance – may well be a pure ideological (or perhaps simply uninformed) endeavor.

Although research into developing adequate local government performance measurement devices and benchmarking practices may not be so fashionable these days, the fact is that one still seems to need it. (In fact, one may always need research into this field; with time comes new social, political, administrative, and technological stimuli and possibilities, which essentially make benchmarking a dynamic process.) Despite some academic objections, metrics, indicators, and targets are the backbone of many processes with a real and significant impact on the ground. From local infrastructure investment plans to documents setting international agendas, the measurement, comparison, evaluation, and monitoring of particular phenomena are operational requirements. For example, the recent Policy Paper for Habitat III on urban governance, capacity, and institutional development (Habitat III 2016) calls for new indicators that focus on issues like equity and participation as a way of shifting attention to these problems (e.g., away from the usual concerns, such as the GDP, which has been measured and monitored for decades).

Even if academics and decision-makers were to simply reject benchmarking schemes, dismissing them for being incapable of controlling for local governance complexities, they would continue to be implemented by auditors, donors, analysts, journalists, and many other stakeholders. And if these exercises are developed with little theoretical knowledge and/or practical know-how, then the results are surely bound to be meaningless or even pernicious which, in turn, would further add to the reaction against local government benchmarking programs. A way out of this vicious cycle is to keep nurturing an inclusive and agnostic discussion on the issue, envisioning the incremental betterment of the use of benchmarking in/by local government, which should be viewed as just another tool among many available to help protect the public interest (however it is conceived locally). This entry is an attempt to contribute to this discussion.

The remainder of this entry is organized as follows. The next section briefly describes different types of (local government) benchmarking. Section "Introduction" presents some important definitions regarding indicators and methodologies that have been used to measure and compare local government performance. The fourth section discusses the strengths and limitations of the use of measurement and benchmarking in local governance and how they are connected to the purpose and target audience. The fifth and final section concludes this entry.

## Types of Benchmarking

"Benchmarking" can be loosely defined as the systematic comparison of certain performance measures with predefined reference levels, aiming at continuous improvement (da Cruz and Marques 2014). There are however many types of benchmarking that differ in their purpose, process, and ownership. Ammons and Roenigk (2015) argue that there are three types of benchmarking in the public sector, the "comparison of performance statistics," "visioning initiatives," and "best practice benchmarking." The most common version of benchmarking applied by (local) governments is the comparison of performance

statistics, where authorities compare their figures with applicable standards or the figures of other service producers (i.e., other local governments or entities providing the same services). This type of comparison is sometimes called "metric benchmarking" or "results benchmarking" (Ammons and Roenigk 2015). Some authors also refer to "metric benchmarking" when the process involves quantifying the relative performance of local governments. These assessments are frequently voluntary but can also be compulsory (e.g., if it is required by higher tiers of government). The necessary information may be collected by a single local government, cooperatively by several municipalities or by a third party.

The (less common) visioning initiatives focus on broad goals for a locality or a region. These programs tend to be more based on social targets than on service delivery metrics. Best practice benchmarking – or "process benchmarking" – comprises a detailed scrutiny of particular operating or production procedures. The goal here is to identify the top performers of a particular process (say selective collection of recyclable urban waste), understand what makes them top performers, and ultimately adopt or adapt their practices. Finally, it is worth mentioning a type of benchmarking that does not fit well in the previous categories: "customer survey benchmarking" entails the gathering and analysis of customer's (i.e., citizen's) perceptions (da Cruz and Marques 2014).

Another way of categorizing benchmarking initiatives has to do with their scope. If a given local government compares its performance against that of other municipalities (e.g., to learn and improve certain processes), it is said that it is performing "external benchmarking." If that local government compares the performance of its various departments and/or employees (e.g., to assign rewards and/or sanctions), the exercise is called "internal benchmarking."

With regard to their nature, benchmarking can be "competitive," "cooperative," or "collaborative" (Kitchin et al. 2015). In competitive benchmarking, local governments can be rated or ranked regardless of their willingness to participate. In cooperative benchmarking schemes, local governments cooperate with the analyst/assessor, usually on the basis that they are not competing directly with the other participants regarding the issue being compared. The rarer case of collaborative benchmarking requires several local governments working together to select or design specific indicators and to share information and knowledge with each other.

Referring back to the role of higher tiers of government in the comparison of performance statistics of local governments, several distinctions can be made (da Cruz and Marques 2014). When the central government orders and/or facilitates performance reporting, benchmarking can be labeled as "vertically intergovernmental." When there is an implicit or explicit comparison between local governments, it can be categorized as "horizontally intergovernmental." If a higher tier of government assumes the design of the benchmarking model and the control or supervision of information exchange, some authors classify this as "compulsory hierarchical management" (Kuhlmann and Jäkel 2013). A "vertically coordinated management" refers to the cases where higher tiers of government cooperate with local governments to design the model, gather the data, and react to the results. "Voluntary local self-management" applies to programs where higher levels of government have no intervention. Finally, "independent monitoring" is used to classify those initiatives where the civil society, nongovernment organizations, scholars, or other stakeholders carry out local government benchmarking, for example, using perception or publicly available administrative data (da Cruz et al. 2016).

## Indicators and Methodologies

All the above mentioned types of benchmarking require different sets of indicators and sometimes models to aggregate these indicators. Indicators allow assessing the impact levels of a particular phenomenon and ascertaining the degree to which a particular objective is being achieved. They do

not have to be "quantitative" necessarily. Complex phenomena can be evaluated through "constructed" performance descriptors that use categories describing and defining the different performance levels "qualitatively." Nevertheless, whenever they are conceivable, "direct" (or natural) quantitative indicators are preferable, because they are unambiguous. But because the underlying phenomena of interest are often intangible or not directly observable, "indirect" (or proxy) indicators must be used instead (Kitchin et al. 2015). The quality and type of data used is a decisive factor for the success of any benchmarking exercise. Models based on objective, factual, hard data tend to be less controversial than the ones relying on, for example, perception-based data, such as surveys or expert coding (da Cruz and Marques 2014).

There are three main types of local government indicators with regard their purpose (da Cruz and Marques 2014). "Descriptive" and "contextual" indicators provide insight into the operational environment of local governments. They represent, for example, population, spatial, geographical, or natural characteristics that, in most cases, are not controllable by local decision-makers. "Diagnostic," "performance," and "target" indicators are obviously the ones more relevant for this chapter. These indicators may refer to "input" (resources required/consumed), "output" (amount of work/services provided), "efficiency" (relationship between outputs and inputs), "outcome" (results, consequences, or impacts), "effectiveness" (quality, responsiveness, achievement rate), or "productivity" (combining efficiency and effectiveness or change in efficiency over time). When targets are set for these indicators, they can be absolute (to reach a predefined level) or relative (e.g., to be in the top 10% local governments on that indicator). Finally, "predictive" and "conditional" indicators attempt to simulate and forecast future events and performances. Despite being a growing field with practical significance, predictive analytics are not so interesting for local government benchmarking (at least as it is defined here).

As in many other circumstances, on the matter of local government benchmarking, indicators are merely "partial" measures of performance. A "single indicator" will necessarily have a narrow scope, and gauging the "global" performance of something as complex as a local government is an exercise that involves the consideration of many relevant variables and conflicting objectives. "Composite indicators" combine many single metrics to develop a measure that attempts to determine the degree to which many partial objectives (or the overall objective) are being achieved. There are several methods to aggregate single indicators and/or consider several variables at once. In efficiency or productivity analysis, both "parametric" and "nonparametric" methodologies have been used to carry out benchmarking (da Cruz and Marques 2014). Parametric methodologies require an a priori definition of the cost or production function to which each unit is compared to (e.g., stochastic frontier analysis). Nonparametric methodologies use the information about the inputs consumed and outputs produced within the dataset to estimate the overall scores (e.g., data envelopment analysis). These methods are also classified as "frontier" when the units are compared against an efficient or best practice frontier (and "non-frontier" otherwise).

The ways in which the many inputs and outputs (and sometimes exogenous variables) are rescaled to come about with an overall measure of performance in these methods are typically quite complex (and opaque), and its practical significance is often contested. Conversely, in multicriteria decision analysis modeling, the focus is usually on ensuring that the evaluation model fits the preferences of the problem owner or relevant decision-maker(s) (e.g., that the functions that transform impacts measured by the indicators in "value" or "utility" and that the weights that allow for aggregating the various criteria are in line with their value system) (da Cruz et al. 2016). Irrespective of the body of knowledge and toolkit selected to aggregate single indicators, on many occasions, the process is just too complex, costly, time-consuming, or controversial to be implemented in practice. The use of scorecards and dashboards is often a way to circumvent these obstacles (da Cruz and Marques 2014; Kitchin et al. 2015).

## Purpose, Audience, and Limitations of Benchmarking in Local Government

The ability to cast a vote periodically in free and fair elections is a key societal mechanism to exercise the "right to the city" (Habitat III 2016). A healthy local democracy, however, requires much more than this. For example, populations also need to have a voice and to be able to scrutinize the actions of their representatives and "vote with their feet." But to fully enjoy these and other crucial privileges, citizens need to have access to information. In reality, the point made about local democracy and availability of information could be made about any levels of governance. Nonetheless, it is worth stressing it here due to the visibility (e.g., *media* attention and other external scrutiny) and accountability mechanisms being generally weaker at the local level, particularly in smaller and mid-sized localities (Transparency International 2015).

The most useful information for any stakeholder tends to be the one that is comparable (and thus prone to benchmarking exercises such as ranking in league tables, assignment of ratings, etc.). For example, assuming that, for a given locality, the actual local government revenue in a particular year corresponded to 70% of what was originally budgeted, was this a "good" or a "bad" performance? An obvious approach to try to answer this question would be to check the implementation of the revenue budget in other local governments or even the regional or national average. It might be the case that this figure is close to the average since the mix of funding sources raises uncertainty about the budget or certain socioeconomic conditions impact on the financial income of most localities. Perhaps a local shock or a following political decision can explain a lower rate (e.g., the Mayor decided to reduce the bulk of local taxes in view of a surge of unemployment in the locality). Or maybe the local executive endorses poor financial management. This illustration is also useful to point out that performance statistics do not contain answers in themselves. They are just a means to tap into the mechanisms behind certain phenomena.

In simple terms, performance measurement and benchmarking in local government can have two main purposes, which are linked to two different audiences (e.g., internal management and local administrators, as opposed to public accountability and local citizens). To begin with, there is internal management: as mentioned at the outset, local governments are responsible for many societal tasks, some more tangible (like providing drinking water, treatment of wastewater, collection and treatment of urban waste, suitable mobility services, among others) and some more intangible (like promoting inclusiveness, social equity and cohesion, cultural dynamism, economic development, etc.). Regarding the more palpable set of responsibilities, irrespective of the organizational mode of delivery (i.e., public, mixed or private management), local administrations need performance measurement and benchmarks to ensure that the services delivered are meeting the needs of the population and to monitor how public funds are being spent (e.g., could the same level of service be delivered at a lower cost? would potential savings arise through technological innovation or different communication strategies? are there exogenous factors affecting fixed costs?).

Even if local governments do not engage with this type of assessment themselves, they are often subject to it via external regulation. Many utility and other local infrastructure services are subject to the authority of sector-specific regulators (though the powers of regulatory agencies can vary substantially, from mere "naming and shaming" influence to tariff-setting prerogatives). Other high-level monitoring is very common, for instance, concerning municipal finances (e.g., debt ratios, financial independence, average payment period to suppliers). Many of the performance statistics used for this kind of "internal management" are not interesting to the general public. In fact, some authors highlight the perils of an overload of data (da Cruz and Marques 2014). Although, as a principle, all administrative information should be accessible to the public (at least upon request), the communication strategy must consider the audience and final users' needs.

The importance of comparing performance statistics on the operations of local public services with peer localities as a means (among other means) to identify strengths and weaknesses is not hugely controversial. One should expect public managers to act professionally and assess and monitor performance to be part of the day-to-day job. The use of those performance statistics to enact rewards and sanctions to and within local government administrations, however, is clearly problematic. It is problematic because it is impossible to consider all the factors affecting performance (and it can therefore be biased or unfair); because "someone" selected the indicators or designed the evaluation model and – willingly or unwillingly – attached a certain value system to it (which can therefore be challenged); and because the main objective of benchmarking (which should be seeking continuous improvement) becomes a principal-agent game.

If done sensibly, it is the actual process of benchmarking, more than the final results, that can generate the most benefit. Thinking about problems, discussing practices, and exploring ways to assess them collectively contribute to organizational learning. The most successful local government benchmarking experiences are the ones that are able to stimulate "peer-to-peer" learning and dissemination of innovative practices among localities after comparing data. As Ammons and Roenigk (2015, p. 309) put it: "The promise of benchmarking as a management tool for local governments rests on the premise that organizations can learn from one another. If this premise is correct, then the practices that have led to success in one local government can be learned through benchmarking, adapted as necessary, and applied by another local government to improve its own operations and results."

This idea of learning with peers to adapt or adopt new practices is more in line with the concept of process benchmarking discussed above. However, this is not the type of benchmarking more commonly used. There are several reasons for this. In particular, it highly depends on the willingness and commitment of the participants (voluntary schemes tend to be more prone to these practices). First, not all representatives and top officials and public managers welcome comparisons (Ammons and Roenigk 2015). Mistrust, fear of embarrassment, and resistance to reporting "bad news" are customary in benchmarking initiatives (da Cruz and Marques 2014). Second, benchmarking consumes resources. Local governments need to commit time and financial resources to engage with robust benchmarking processes. In a setting of reduced public budgets, local governments might have other immediate priorities (although in the long run the investment may well pay off). In light of this, many benchmarking projects simply rely on the comparison of performance statistics (mostly through rankings), neglecting the ultimate objective of governance and service improvement and devolving the process into a "beauty contest" (Ammons and Roenigk 2015).

Most of the simple examples and illustrations mentioned so far focus on assessing specific/bounded problems, services, or activities individually. As discussed above, attempting to assess the performance of a range of policy sectors or even the overall performance of local governments generally entails the use of composite indicators or of scorecards and dashboards. This is obviously a much more ambitious undertaking. There is no denying, however, that, if feasible, it could be useful for citizens and other stakeholders. On the whole, populations are concerned with all aspects of local governance. They are also more concerned (and affected by) results and outcomes than with intermediate measures. Scholars from various fields of research (public administration, operational research, sociology, political science, etc.) should continue to carry out enquiries into this topic.

Despite the complications, there is already a wealth of recent studies on the design and use of composite indicators to assess and inform local governance practices. The Municipal Transparency Index developed in Portugal, for example, is an interesting case (da Cruz et al. 2016). This tool, which proposes to assess the transparency of local governments by scrutinizing the type and amount of information disclosed by them on their official websites, was modeled in a participatory manner, where a group of decision-makers with legitimacy to weigh in on the topic defined

what should be measured and how it should be valued in the assessment. Other interesting examples exist in the literature, and the success factor seems to be the extent to which the analysts/facilitators can consider the needs of the final users as well as the opinions of those being monitored and develop a protocol that safeguards them from misconceived reactions and allows for identifying the reasons behind (superior/inferior) performance.

Beyond the substantive issues at the core of local government benchmarking, other more practical limitations need also to be considered. Some of these issues are connected to human error. As in other applications, collecting data and measuring local government performance typically require a battery of coders and assessors, which unavoidably add "noise" to the data. The items being scored can also be imperfect measures of the phenomenon they propose to gauge. Sometimes, the indicators can even have a perverse effect. Consider now a case where the implementation of the spending budget is used as a proxy measure to assess the credibility of the local policies and planning (e.g., as a percentage, weighting each entry of the budget by its initial amount). The normative belief here would be that rates of budget execution close to 100% would indicate higher credibility. However, a local government that managed to attain considerable savings in the expected spending (e.g., because it innovated and found cheaper ways to deliver services or a specific project proved to be unattractive due to some external development) will have an incentive to spend "no matter what," even if it is wasteful, in order to appear more credible in its commitments (if there is no effort to contextualize these indicators, which is the most common case in local government benchmarking schemes). Setting off strategic responses to maximize scores, with little care for the true public interest, is a major drawback of many local government benchmarking practices. Finally, some authors argue that benchmarking deploys isomorphic forces that drive local governments toward adopting the same practices and, therefore, promoting uniformity rather than innovation and improvement. Other authors, however, claim that process benchmarking is actually an "act of defiance" in relation to isomorphism by fostering local governments to depart from the "business as usual" whenever superior practices are identified (Ammons and Roenigk 2015).

## Conclusion

It is important to keep in mind that very often "what gets measured is what matters." This can be problematic by putting too much emphasis on certain more tangible (and therefore more "measurable") problems. Still, in local governance the problem certainly supersedes the tool. And the problem is how to keep improving and reinventing the practices of local governments so that their key role in governance and their relationship with citizens and other stakeholders can continuously respond to a dynamic environment and contribute to a healthier and fairer society. When done sensibly, benchmarking can assist in this endless effort. However, it is just a small part of a much larger set of concerns and approaches to the problem.

If local government benchmarking passes all the preliminary tests (e.g., there is willingness to engage by the local leaders, the stakeholders involved are conscious of the limitations and inherent implications of using indicators and benchmarking to inform local governance, resources are available to carry out the assessment and inquire into the causes,. . .), there are still many matters to consider. First and foremost, one needs to make sure the right things are being measured, in the right way, and that the results are in the right format, considering the purpose and audience. One also needs to ensure that the champions of benchmarking initiatives are constantly aware and flexible enough to change the scheme (e.g., adapt to new or newly uncovered requirements) and committed to critically evaluate the likely unintended effects. With all these steps and requirements, local government benchmarking can be very complex and indeed very costly. The research community may help navigate the complexity and curb these costs by trying to adopt a nonideological approach to the issue ex ante.

It is a matter of fact that most contemporary benchmarking efforts in local government simply rely on comparison of performance statistics. There is generally no effort to conduct further analyses concerning the causes for inferior/superior practices or outcomes and very little engagement between local governments and their departments about these matters. Without this follow-up built into the schemes, benchmarking becomes a hollow game that corrupts the theoretical objectives and prompts defensiveness and even rejection by the stakeholders.

Another beneficial change in the perceptions about local government benchmarking would have to do with communication, particularly when the audience/final user is the general public (effective communication in internal benchmarking is also important, but its lack may not be so damaging in this case). It is important to raise awareness about the boundaries of benchmarking and the fact that "bad" results or scores do not necessarily reflect "bad" performances or incompetency. There might be a good reason to run a deficit or sustain higher debt levels. It might be the right thing to do, given the needs of the local population or the electoral commitments of the executive. However, once again, benchmarking can lend a hand to politicians who seek to defend their nonconforming, though very legitimate, performance. Benchmarking has many problems and limitations. However, placing all trust in political rhetoric does not sound ideal as a sole alternative to it (the track record of many localities suggests so). There are many approaches to observe and understand local governance (e.g., ethnographic studies, multidisciplinary approaches) that produce different but valuable insights.

In an ideal world, process benchmarking would be the preferred form for local governments, but, in practice, this rarely ever happens (some of the reasons were discussed above) even though, in theory, this type of cooperation should be more expected in the public sector (since private entities tend to protect knowledge for competitive leverage and commercial advantage). As a second best alternative, the comparison of performance statistics can also have its merits. Its success highly depends on the process of designing the scheme and on the uses of the scores. Attempting to introduce high-powered incentives by linking financial incentives (e.g., block grants by the central government) can result in unfair results on the ground. Naming and shaming practices are certainly much more harmless in that sense.

Indicators and benchmarking models are infused with values, politics, and context. For this reason, it is crucial to avoid that performance measurement and benchmarking become yet another tool by the powerful and for the powerful against the weak. Benchmarking will never solve all the problems of local governments. It will also never replace the political process, and the grand claims about the potential of technocratic solutions should be critically challenged. However, if adequately designed, it can help local institutions and other public entities to do a better job in the pursuit of the priorities that should be set by the legitimate representatives of the citizens.

# Local Government Budgeting in Bangladesh

Mohammad Rafiqul Islam Talukdar
Government and Politics, Asian University of Bangladesh, Dhaka, Bangladesh

## Synonyms

Bangladesh perspective; Budgetary autonomy; Budgetary decisions; Budgeting process; Influencing phenomena in budgeting; Local government Union Councils

## Definition

Local government budgeting in Bangladesh refers to the effects of influences and magnitude of autonomy in budgetary process and budgeting decisions of local government Union Councils on the perspective of Bangladesh.

## Introduction

The research on the influencing phenomena and autonomy at the budgetary process of local government Union Councils/Parishads (UPs) in Bangladesh is based on a combination of political psychology, applied economics, and public management issues.

**Political psychology** is an interdisciplinary academic field related to describing, in this study, how individuals as public institutional representatives make their decisions relating to budgeting considering the exogenous political and cognitive psychological factors, and thus it is dedicated to understanding politics, politicians, and political behavior from a psychological perspective.

The way Henley (1992) defines *budgeting*, it strongly reveals the concept of "**applied economics**." *Budgeting is a process of measuring and converting plans for the use of real* (i.e., *physical*) *resources into financial values* (Henley 1992).

**Public management** issues include decentralization, local government finance, and local governance, as well as organization and budgeting theories and local government budgetary process.

A 2001 study of Khan observes that one of the vital concerns in relation to decentralization in Bangladesh is greater autonomy of the local state (Khan 2001). The principal premise of the current-round research is that a greater autonomy of the local state helps improve the effectiveness of decentralization. The other premise of the research is that demands for public goods and services are increasingly exceeding the supply at local governments in Bangladesh and elsewhere, particularly in developing countries.

The main purpose of the research is to explore the nature, cause, and consequences of the dimensions of influences and magnitude of autonomy in budgeting decisions of local government Union Councils in Bangladesh.

The research contributed in the literature stream of public administration, specifically in decentralization, in local government finance as well as budgeting, and in local governance studies. The study findings to some extent substantiated the rationality of conditional national government transfers to the sub-national governments in Bangladesh. Beyond the general theoretical and practical significance of the study, its findings led to inviting a fundamental debate on the national-local tax base system and appreciated the fact that central hindrance toward effective functioning of the local government Union Councils in Bangladesh is the crisis of ownership and competence of UP representatives.

## Context

Bangladesh, officially the People's Republic of Bangladesh, is a sovereign state located in South Asia, whose capital is Dhaka and state language is Bengali (Talukdar 2014). Despite a long heritage of local government in Bangladesh, success of decentralization is mixed here, and it has brought a little pro-people innovation.

There are several distinct reasons for that: first, a weak intergovernmental relationship – poor status of balance of power between central and local governments and poorly set inherent links between and among local government institutions; second, disproportionate magnitude of administrative, political, and fiscal decentralization; third, the frequent changes of the system; fourth, imbalance between functions, finance, and functionaries; and fifth, absence of an aggregate local governance policy. The focus of the research is intrinsically linked to the all five reasons for the mixed success of decentralization in Bangladesh.

Until the recent development of decentralization in Bangladesh, only the Union Parishad – *the lowest level unit of rural local government in Bangladesh* – to some extent, had the devolutionary decentralization among the rural local government institutions there (Talukdar 2010). By now, Bangladesh has separate acts/laws for all local government institutions and elected councils for all such institutions.

## Study Method

The study has employed qualitative method with six case studies on criteria based purposively selected UPs at Sunamganj district in Bangladesh. The data collection techniques of the research include 'in-depth interviews' of chairpersons and secretaries of the unit of analysis (i.e., UPs), 'focus group discussions' of members of UPs, 'document reviews' of UPs, 'media review', and 'researcher's comprehensive observations'.

This study further employs an emergent framework. The emergent approach allows here understanding the concerns of research questions from the perspective of the elected representatives and secretaries to the UPs, that is, the research participants' perceptions and concerns as they emerge, rather than their voice being refocused. Such emergent approach is going to follow the lens of some existing theories. The study draws on the grounded-theory approach to data collection, analysis, as well as interpretation, and thus its findings are closely linked to data and the context. There are some key variations between this approach and the full grounded-theory method defined by Glaser (1978, 1992).

Figure 1 shows the data analysis mapping, used in this research, focusing on the causes and process of influences and their implications on the budgetary autonomy of local government UPs in Bangladesh.

**Local Government Budgeting in Bangladesh, Fig. 1** Data analysis mapping

## Research Results

Almost all the influencing phenomena – source of resources, previous year budget, scarcity of resources, local demands, political and personal traits of the Chair, local problems, legal aspects, UP competence aspects, and council management – hold both de jure and de facto characters, except political and personal traits of UP Chairs, and legal aspect. There is no de jure ground for political and personal traits of UP Chairs, excluding the fact that they must be elected by the electorate of the community, while the legal aspect holds entirely de jure nature.

A rising scale of community demands; a limited scope of revenues; an excessive dependence on governmental transfers as well as a high magnitude of conditionality of the transfers; an absence of highly competent and responsible UP leadership as well as councils; the government politics with local government, i.e., keeping UPs highly dependent both administratively (e.g., staff shortage and legal dominations) and financially (e.g., leaving UPs with very limited revenue sources); and the legal constraints all help make excessive as well as diversified effects of the influencing phenomena in the UP budgeting process and decisions.

Box 1 shows how causal relations govern the causal mechanism as well as influence in UP budgeting decisions and beyond.

**Box 1 Theoretical Skeleton of How Causes Govern the Influence Mechanism in Union Council Budgeting and Beyond**

First, scarcity and sources of resources have their influence in making UPs resource-centric focused that is alike Pfeffer and Salanci's (1978) resource dependence theory. These, in effect, make UPs heavily dependent on excessive conditional intergovernmental and slightly on nongovernmental transfers for undertaking their assigned responsibilities and delivering best possible public services.

Second, government transfers are likely to be based on the previous year actual transfers and revised budgets and the performances as well as outcomes of the previous year transfers in local governance. In effect, last year's actual government transfers tailored the revised budget of the local government Union Councils. The government's response to the new year budget is not necessarily based on the proposed budget only but also heavily based on the government's politics of the budgetary process and decisions – i.e., budgetary incrementalism approach of the government that principally counts the performances as well as outcomes of the previous year transfers also that is alike to the well-expressed Wildavsky's seminal work, "The Politics of the Budgetary Process" (Wildavsky 1964).

Third, evolving local problems and increasing demands make UPs concerned regarding external environments to assume and adapt with contingency factors and make them interconnected with other local government institutes in their areas as well as dependent on national government and non-government for financial support and technical cooperation. Thus, these aspects stress interorganizational relations (Baker et al. 2011) and allow UPs more interactions with their environments that is alike Thompson's (1967) and Lawrence and Lorsch's (1967) structural contingency theory.

Fourth, applications of the relevant government law, rules, and regulations and their dominance go beyond budgeting decisions of UPs to their management as well as local governance. UP competence aspect matters in their management, planning, and budgeting processes and helps build UP confidence and competitive advantages, effects of which go to the local governance.

Fifth, political and personal traits of the Chair influence UPs not only in getting competitive advantage in planning and budgeting process and decisions but also

(continued)

**Box 1 Theoretical Skeleton of How Causes Govern the Influence Mechanism in Union Council Budgeting and Beyond** (continued)

in building a self-responsible Union Council and participatory management as well as robust local governance architecture. Political affiliation and leadership quality also help build political and social networking, and thus ruling party-affiliated UP Chairs could have access to some special grants, but they still lose some opportunities if there are strained relations with the concerned Member of Parliament (MP).

Sixth, UP council management encompasses a UP management culture leading to the magnitude of transparency and accountability in UP budgeting decisions. Such accountability mechanism helps pave the pathway of robust local governance.

The research reveals that the influence of concerned phenomena in UP budgeting decision-making process does not certainly collide with the autonomy of UPs in the budgetary decisions, but their effects are evident with varying degrees and dimensions on the budgetary autonomy of UPs, even to the UP overall management and local governance.

The indicator-based empirical analysis reveals that the magnitude of influences is almost double than that of the budgetary autonomy of UPs at Sunamganj district in Bangladesh. The local government UPs seem to be homogeneous in Bangladesh. Thus, the budgetary autonomy of local government Union Councils is a serious apprehension in the study of decentralization and local governance in Bangladesh.

## Contributions

### Theoretical Contribution

Management of public services could be improved in terms of accountability and performance, if they are entrusted to the local level officials, compared to the far detached national bureaucrats (Ostrom et al. 1993). But empirical observations support that there are lots of other deliberations here. Rationality of the government conditions and control on local government Union Councils in Bangladesh is tied to the crisis of self-responsibility as well as competence of Union Council Chairs and members.

Government conditions are furthermore entrenched in the inevitable intergovernmental resource dependency and call for ensuring financial accountability and monitoring the performance of local government Union Councils. However, the community perception of "accountability" is quite different from the accountability frame academics advocate. This observation is somehow supported by Ahmed et al. (2016). Figure 2 below illustrates the comprehensive accountability framework of the local government Union Councils in Bangladesh.

Both the UP representatives and the general citizens put less emphasis on formal accountability tools and concerns, but more on the social accountability with traditional and informal practices (Ahmed et al. 2016:42). Observation of the current research supports Ahmed et al. (2016). Thus, the UPs' social contributions and performance would be highly appreciated if those could be documented properly.

Nonetheless, field observations also reveal that institutional ownership as well as competence of UPs to manage their revenue and expenditure portfolio sensibly is a serious concern that justifies the conditionality and guidelines of government transfers to them.

In fact, ownership, competence, as well as financial accountability and conditionality are intrinsically linked. These are also linked to an important unresolved question that is beyond this research's terms of reference: What make the local government UP representatives seriously interested to be elected there? What are the incentives and motivational factors for them to be elected there? The research documents their salary and formal benefits, which seem very poor. The 2016 study of Ahmed et al. partly raises the same concern. Ahmed et al. (2016), however, present a precise response to the unresolved question:

**Local Government Budgeting in Bangladesh, Fig. 2** Formal and informal accountability flow of UPs

> By influence of the positions they (elected members and chairs) can grab many lucrative businesses and make money. The people do not think that UP representatives are making money from UPs rather they utilize UP leadership identity in exploiting many other lucrative money-making ventures. (Ahmed et al. 2016: 45)

Nonetheless, Ahmed et al.'s (2016) response is not evidence based and still could be treated as anecdote. Further study to understand the political psychology of UP representatives regarding their interest for being elected is a must.

### Practical Contribution

Practical contribution of the study proves the fact of maximum level local revenue collection cannot solve the autonomy crisis of UPs considering the current revenue base and legal constraints.

Research proves that the maximum possible amount can be collected from the local revenue assignments is relatively very insufficient comparing to the aggregate budget of a year (as shown in Table 1).

The research solves this problem providing the two options: first, increasing local tax base/net by trading off national government resource base at the local level and second, tax from the all local sources should be collected by local governments and then this collected tax shall contribute equitably to the national government as well.

By putting the both options above, the research just invites an academic debate. Yet the solution alone cannot solve the autonomy crisis of UPs unless the legal constraint (GOB 2009: Sect. 54:3) is resolved.

**Local Government Budgeting in Bangladesh, Table 1** Maximum possible amount of UP own revenue compared to the budget

| Sample UPs | Aggregate budget 2016–2017 | Maximum possible amount/scope of own revenue | Ratio |
|---|---|---|---|
| Fenarbak | 18,200,000 | 1,343,000 | 14:1 |
| Jamalgonj Sadar | 20,428,000 | 1,611,000 | 13:1 |
| Joysree | 7,972,000 | 300,000 | 27:1 |
| Modhanagar | 8,050,000 | 300,000 | 27:1 |
| Uttar Sukhair Rajapur | 8,628,000 | 650,000 | 13:1 |
| Bhimkhali | 13,487,000 | 595,000 | 23:1 |
| Average | 12,794,167 | 799,833 | 16:1 |

## Conclusion

Beyond the theoretical and practical contributions of the study, the research observations somehow support both the principal and secondary premises of this research mentioned in the introduction of this research brief. In the former case, research shows that autonomy of the local state alone

cannot improve the effectiveness of decentralization. It must go with local government ownership, competence, and accountability framework.

The observations of this study and literature review strengthen the latter case that the demands for public goods and services are increasingly exceeding the supply at local governments in Bangladesh and elsewhere, particularly in developing countries. Yet the revenue assignments of local governments in most developing countries including Bangladesh are often very poorly designed and very limited.

The research proves that the maximum possible amount that can be collected from the local revenue assignments is relatively very insufficient compared to the aggregate budget of a year. Thus, the maximum level local revenue collection cannot solve the autonomy crisis of UPs considering the current revenue base and legal constraints.

Consequently, increasing local tax base/net by trading off national government resource base at the local level along with the legal reforms is one way to establish minimum autonomy through growing its own resource capacity. But this alone cannot provide the resources needed to an UP considering its growing local problems and increasing community demands.

Thus, it requires flexible as well as less conditional intergovernmental transfers following its approved budget submitted to the government. Government's incrementalism approach in transferring funds based on the previous year transferred amount and performance audit should not be stereotyped; rather it must be responsive to the UP-approved budget submitted to the appropriate authority of the government. Otherwise, the citizenry involvement, as well as stakeholder consultative processes, for example, ward shaba meetings and UP open-budget meetings, might superficially become counterfeit.

Local governments in Bangladesh, particularly Union Councils, have yet to grow a high sense of self-responsibility, commitment, as well as competent leadership and capable councils. Once this grows, the basis for lessening government conditions to the intergovernmental transfers and/or increasing local tax base of the local government will pave the way.

The research, also, takes a stance that reducing government control and increasing competent as well as responsible UP councils and leadership should go side by side. Furthermore, it suggests placing here robust oversight and accountability mechanisms.

Importantly, two issues, found in this research, require further study.

First, the further study requires an in-depth understanding of how the influencing phenomena affect beyond the UP budgeting decisions to its overall management and local governance. In other words, to what extent do these influencing phenomena affect the autonomy of UPs in their overall management and local governance?

Second, further study is necessary to understand the reasons why UP representatives are interested in being elected and what kind of incentives are attractive for them to be elected despite their salary and formal benefits being very poor.

# Local Government in Kazakhstan

Saule Emrich-Bakenova
Department of Public Administration and International Development College of Social Sciences, KIMEP University, Almaty, Kazakhstan

## Synonyms

Decentralization; Local self-government; Public administration; Regional development; Sub-national government

## Introduction

Kazakhstan is a highly centralized unitary state system which, for various reasons, has pursued decentralization more than once since gaining independence in 1991. In doing so, Kazakhstan has established its own model of local government, institutionalized in law and policy, which divides responsibilities and powers with the central government and grants citizens a specific form of local self-government, including the right to take small-scale budgetary decisions within their areas of authority.

Local government in Kazakhstan is principally codified in law by the Constitution of Kazakhstan (1995) and by the Law on Local Public Administration and Self-Government (2001; hereafter the Law). In addition, local government is affected by various policy documents and most recently decentralization objectives are set out in the national development plan, Strategy "Kazakhstan 2050," the Plan of the Nation: 100 Concrete Step, Policy Framework for development of local self-government (President of the Republic of Kazakhstan 2012a, b, 2015).

These are only a few key legislative and policy initiatives, among many more adopted and proposed decrees, laws, and codes that Kazakhstan developed since its independence. On the one hand, these legislative and policy activities are evidence of a strong intent of political elite to "define a clear role for local government" (OECD 2017, 55). On the other hand, a successive list of legislative and policy outputs and multiple amendments to existing documents may support the view that local government is in an ongoing state of transformation (OECD 2017; Yuvitsa 2019).

Indeed reforms of local government in Kazakhstan are characterized as difficult and contradictory. From 2001 until 2017, the Law on Local Public Administration and Self-Government was amended by 84 other laws (Dosmyrza and Zhanuzakova 2017). Over 33% of the changes were made in the period between 2011–2012 and 2014–2015. There was on average one change every 65 days. Most frequently amended were provisions that regulate authority of local executives of different levels (108 changes) followed by 24 amendments concerning local representative bodies (Ibid.). The frequency and number of changes in the Law at minimum is a solid indication of instability of the legal base of local government.

Yet, there is another perspective. Kazakhstan experts emphasize that unitary structure does not presume super concentration of power by the central state. It only safeguards against territorial separatism (Gabdualiyev 2015, 12). Political elites are taking one step at a time which is different from "stamping feet" or being "stuck" in the reform process. It is in fact a clearly measured approach to avoid possible mistakes and various possibilities for destabilization in general and in local territorial units specifically (Vaida 2019). Local government development then is not just "a matter of managerial wisdom, but also a useful political strategy for enhancing the autonomy of executive elites" and safeguarding monopoly control of the central state (Dunleavy and O'Leary

1987, 180). The political formula of Kazakh decentralization is best expressed in the following statement: decentralization measures should be encouraged only in so far as they would not lead to the "weakening of dominant vertical power and jeopardizing implementation discipline and order. The central government should be always on guard" (President of the Republic of Kazakhstan 2012a).

The argument we advance here is contrary to the assertion of some of the reviewers that the existing model of local government in Kazakhstan is in a constant flux, prone to uncertainties, and lacking effectiveness. On the contrary, it shows, regardless of employed methods and forms, remarkable stability and continuity. Kazakhstan continues to be true to its "pre-independence" features with the central government being at the "pinnacle" and local governments continue playing the role of implementation bodies of central government policies (OECD 2017, 40; see also Bhuiyan 2010; Aitkazinov 2010a; Makhmutova 2006, 2001).

In this chapter, we review principal features of the local government model in Kazakhstan. We first describe the administrative-territorial structure of Kazakhstan followed by review of actors and their functions in local public administration and self-government, and briefly review the financial bases of local government and local self-government. We conclude the review with implications of the local government model.

## Territorial Structure: What Is Local?

In accordance with the Law on Administrative-Territorial System (1993), Kazakhstan consists of regions and settlements. Regions include oblasts (regions), rayons (districts), and rural districts. Settlements are compactly populated areas formed as a result of economic or other societal activities of citizens with population of no less than 50 inhabitants. Settlements are in turn subdivided into urban and rural. Urban settlements include cities of republican, oblast, and district significance including villages that are situated on their territories. Rural settlements include all the remaining populated areas regardless of their subdivision.

There are three tiers of governments below central government (Table 1). First tier: three cities of republican significance (Nur-Sultan, capital; Almaty, former capital; and Shymkent) and 14 oblasts (regions). The second tier comprises oblasts that are further subdivided into smaller units: rayons (districts) and cities of oblast significance (more than 50,000 inhabitants). The third tier comprises the cities of rayon significance (between 10,000 and 50,000 inhabitants), districts with the larger cities, rural districts, townships, and villages.

In the Soviet era, subnational levels of administrative-territorial unities were categorized as *local* (Aitkazinov 2009). This generalized usage of the term "local" continues in contemporary Kazakhstan. Despite the difference, it equally applies to distinct territorial levels: oblast (first tier), rayon (second tier), and villages (third tier).

Oblasts in Kazakhstan cover large territory, exceeding in some cases the territory of European states, with population size over one million. The oblast level of the state administration is also a primary authority at the regional level responsible for implementation of state socioeconomic policies and coordination and control of local public administration bodies and self-government. It could not be managed as local (municipal) entity. It is considered intermediate (mezzo) subnational level (Ibid.).

Another caveat is that the Constitution (1995) does not define levels of local self-government (Beisembayeva et al. 2015). The Law then, taking this for granted, states that local self-government could be established on several levels: oblast, rayon, city district in cities, cities of rayon significance, towns, and villages. As argued (Gabdualiyev 2015), it would have been logical to identify self-governments with second and third tiers. It is on the rayon and lower levels, local governments are responsible for a broad array of social, economic, and cultural services (e.g., targeting and delivery of social assistance benefits, services to seniors and disabled, ambulance, organization of preschools,

management of communal property, construction, repairs, maintenance of roads, encouragement of entrepreneurship, municipal transportation, sanitary, and water services). These levels are closer to the local population providing them with more effective opportunity for being able to participate directly in managing local issues and being heard.

Continuous association of local government with all three tiers of administrative-territorial units is further complicated by the dominance of regional policies at the expense of localities. Unlike in the European countries, where frequently regional policy-making is highly fragmented and hardly susceptible to political control (Hulst 2005), in Kazakhstan the opposite is true. Optimization of regions and their borders in 1997 led to delineation of regional issues. As a result, the role and interests of local (specifically third tier) communities, where officially over 40% of Kazakh population resides, have been somewhat suppressed by prerogatives of regional planning and development. Central government considers village level as a means for tackling regional policies with focus on the growth of urban centers and mono-cities. The focus on efficiency and effectiveness in use of resources undermines consideration of other factors, including the ability and desire of affected people to move. Consolidation of small, economically constrained settlements into bigger units forces local populations to move to infrastructure as opposed to moving "infrastructure to people" (President of the Republic of Kazakhstan 2018). State budget resources are given to villages with higher economic potentials, while the rest are financed from local budgets and other financial resources.

Decisions about reorganization of administrative-territorial units are made by the president and the government. Determination of economic potential of rural settlements and villages is made by central and local public administration executives (Nurbayev 2019; Jaxylykov 2019). According to international reviewers (OECD 2017), for the most part, Kazakhstan's administrative and territorial divisions have experienced very few and "measured" changes since independence. The principle change has been a reduction in the number of villages and townships (See Table 1). Nevertheless, the issue of top-down reorganization with strong involvement of central state (as in the Soviet era) in restructuring of local communities is difficult to dispute (Yuvitsa 2019). For example, reorganization of third tier territorial units does formally include consideration of representatives of self-government. However, as discussed in later section on forms of local self-government involvement, under existing model, participation of local government community in discussions is only a formality.

## Central State Administration of Local Government

The President of Kazakhstan plays a principle role in providing direction with respect to the country's policies including those concerning local government. All the principle elements of

**Local Government in Kazakhstan, Table 1** Administrative-territorial units through time (as of 2018)

| Central government | | Year 2000 | Year 2008 | Year 2018 |
|---|---|---|---|---|
| First tier | Oblast | 14 oblast and 2 cities of oblast significance | Same as 2000 | 14 oblast and 3 cities of oblast significance |
| Second tier | Rayon | 170 | 175 | 183 |
| | City | 85 | 86 | 87 |
| Third tier | Rural districts<br>Townships<br>Villages | 2,103<br>200<br>7,863 | 2,474<br>35<br>7,105 | 2,253<br>30<br>6,454 |

Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan https://taldau.stat.gov.kz/ru/NewIndex/GetIndex/703909?keyword=

local government development are outlined in presidential strategic documents (e.g., President of the Republic of Kazakhstan 2012a, b, 2015). The president also has the power to appoint and dismiss regional executives (akims) and initiate earlier dissolution of local representative bodies (maslikhats).

The central government is in charge of developing main directions of socioeconomic policy of the state and, in coordination with the president, approving state programs. The government within the granted by the Constitution authority issues decisions that are obligatory on the entire territory of Kazakhstan, and it may also, partially or in full, revoke or suspend decisions of local executive bodies. Local executive bodies only exercise those powers and responsibilities that the central government grants to them. These arrangements are outlined in the Constitution (1995) and detailed in the Law.

Responsibility for local government resides within one or another central department (ministry). Since 2011, general issues concerning local government development in Kazakhstan were under the Ministry of Economic Development and Trade, specifically the Committee on Regional Development. In 2013, the Committee was reorganized and regional oversight was transferred to the newly established Ministry of Regional Development. In 2014, the Ministry was abolished and responsibilities for local government, including oversight and accountability of local executive bodies for regional development, were moved under the Ministry of National Economy, department of regional development. The department's role has been to oversee regional and interregional development, development of mono-cities, local self-government, and village development.

However, these reorganizations may not be over. In Fall 2019, one of the Parliamentary deputies of the leading party Nur-Otan called for the return of the Ministry of Regional Development, arguing that matters of regional development are too complex and require specific differentiated approaches that would account for local specifics including interest of the local population (Tengrinews.kz 2019).

## Constitutional and Legal Basis of Local Government

The First Constitution (1993) of post-independent Kazakhstan in the section *State Territorial Organization and Local Administration* assigned local representative bodies, elected directly by the local population, with decision-making powers within their areas of authority for the period of 5 years and subject to earlier termination by the Supreme Council of Kazakhstan. The local executives appeared under the responsibility of the president and the government (Constitution 1993, Article 92).

The current (second) Constitution of Kazakhstan (1995) has refined, detailed, and expanded the system of local government with addition of the provision on self-government in the section *Local Public Administration and Self-government.* However, this section of the Constitution has not been preserved in its original way and undergone further amendments in 2007. Overall, the Constitution of 1995 (regardless of further changes) reaffirmed the hierarchical organization of the state and subordination of local executive bodies to the central government. The Constitution also defers to the Law in shaping and detailing roles and responsibilities of local representatives and executives bodies and self-government.

## Local Government Institutions

Local public administration is presented by two institutions: representative (maslikhat) and executive (akim and akimat) bodies. As subjects of local public administration, representative bodies express the interests of the local population of the corresponding administrative-territorial units. Local executive bodies are involved in the development of local economy, social sphere, and administrative-political system.

If local representative bodies work in accordance with the Constitution and the laws, then local executive bodies act within the Constitution and in accordance with decisions of the president, the government, and higher-ranking executive bodies (Sapargaliyev 2014). Given that local

representative and executive bodies are part of the unified system of public administration system on local level, they cannot unilaterally determine their own authority. As outlined in the Constitution, competencies of local public administration bodies are determined by the Law. Both maslikhats and akimats are prohibited by law to adopt decisions that would block the development of common labor, capital, finance market, and free exchange of goods and services with the territory of Kazakhstan.

### Local Representative Bodies (Maslikhats)

Maslikhats are the representative bodies of public administration on oblasts and on local levels with exception of villages, rural districts, and townships. The maslikhat's apparatus is a state organization maintained from local budget. Maslikhats deputies are directly elected for the period of 5 years by the population of the corresponding administrative-territorial unit.

Even if maslikhats are supposed to act on behalf of the electorate, general state interests come as priority. Violation of this principle signifies violation of the Constitution and laws. For example, the unitary structure of the state, its territorial integrity, and the form of state administration cannot be changed and maslikhat does not have the right to consider these questions under the pretense of the will of its electorate. This would signify negative political consequences (Sapargaliyev 2014). Those decisions that are outside of the framework of the Constitution and laws could be annulled by the maslikhat itself or by the court decision.

There is no vertical subordination between the Parliament of Kazakhstan (majilis) and maslikhats of all levels. Maslikhats are not considered part of the general system of representative bodies and are not a legislative branch. Normative decisions which they adopt on the territory of their jurisdiction in the hierarchy of legal acts are inferior to acts of the parliament, the president, and the government. While separate, there are though few relations between these two institutions.

Maslikhats deputies elect senators. Previously and ironically, the senate had the power of earlier termination of maslikhats of all levels. Presently, this power is in the president and maslikhats themselves. For the purpose of constructive dialogue, in 2007, senate established a council for cooperation with local representative bodies (Aitkazinov 2009, 98; See Senate of the Parliament http://senate.parlam.kz/ru-RU/senate/maslikhat).

In 2016, maslikhat elections were tied to the election to Parliament (Majilis). While this increases the publicity of the event, election to the local representative bodies in comparison to the Parliament are quite invisible. People who are elected are less known to the electorate (Abramov 2019). For example, more than a half of the maslikhat deputies as a rule represent businesses and only few are engaged in professional politics (Ibid.). In the 2016 election, over 50% of elected deputies represented business structures, 40% worked in public organizations, and around 7% were representative of political parties and NGOs (Informburo.kz 2016).

One would assume that maslikhats independence is ensured in the absence of vertical subordination among maslikhats themselves. However, this does not constitute absence of relationship among them. Specifically, decisions of upper level maslikhat are compulsory for implementation by low levels of maslikhat. At the same time, upper level (e.g., oblast) maslikhat does not have the right to interfere with activities of low levels even in cases of adoption of unlawful decisions. Oblast maslikhat is a connecting body between all maslikhats of rayon and city levels, providing coordination of their activities and collaboration with executive bodies of the region, territorial units of central state, and others state institutions (Aitkazinov 2009; Makhmutova 2001, 2006). However, there are no clear-cut borders in the responsibilities among the levels of local representative bodies. The only exception is the number of deputies corresponding to each territorial level. The Central Electoral Committee decides how many deputies will work in maslikhats within the following range: oblast (region) level – up to 50 members; city level – up to 30; and rayon – up to 25. For example, presently in Almaty with population of 1.9 million – 37 deputies; in Almaty region (about 2 million) – 43 deputies; in east Kazakhstan oblast 1.4 million – 43 deputies; and

in the capital with population of 1.1 million – 25 deputies (Abramov 2019).

In law, the relationship between maslikhats and local executive bodies is based on the principle of checks and balances with accountability of akimats before maslikhats in those questions that are within the competency of maslikhats (Uvarov and Uvarova 2014). Maslikhats have delineated competency in approval and review of implementation of economic, social, environmental programs, and budgets by akims. They also oversee appointments into local public administration bodies (akimats) and review their activities. Moreover, maslikhats have the power to approve presidential nominations for oblast level akims and use Constitutional power of no confidence in akims of all levels.

However, in giving their approval of akims candidacy, maslikhat deputies maslikhat deputies simply rubber-stamp the candidate presented by the President, who has no opponent (Aitkazinov 2009; Informburo. kz 2019). Nor do they ever use granted to them Constitutional power of non-confidence in akims (OECD 2017).

Thus, though integral to the local level and having extensive powers, in practice maslikhats are seldom a decisive body, playing marginal role in local politics.

### Local Executive Bodies (Akimats and Akims)

Unlike maslikhats, local executive bodies are present on all the three tiers of territorial subdivisions: oblast, cities, rayons, and village.

Akimats are formed by akims, who coordinate their staffing with maslikhats. As collegial executive body, akimats are accountable for their activities before the representative body. While this is a very democratic provision, nevertheless it is not entirely developed. More is stated about responsibility attached to individual positions in local executive system as opposed to collegial body, as akimat (Sapargaliyev 2014).

Within their areas of authority, local executives, akims, exercise considerable authority. This includes regulatory and legal decisions on broad administrative and managerial matters of state policies on corresponding territorial units. Akims of oblast level develop socioeconomic forecasts of territorial development, programs, and their implementation; work on drafting local budget and annual report; approve strategic plans of executive bodies; manage communal property; and foster entrepreneurial development and investment environment in their jurisdictions. Low-level executive bodies also have a long list of responsibilities, including assistance in collection of taxes and other obligatory payments, regulation of various land issues, construction and maintenance of housing, road maintenance, development of farming, entrepreneurship, issues related to military support, notary, support in local social infrastructure, and sanitary works. With such broad and extensive roles and responsibilities, local executives naturally are in a constant state of performance evaluation. They present activity reports to maslikhats, to local population including local self-government. Akims and their respective akimats also receive annual ratings from various organizations outside of public administration (Center for Strategic Research 2019; Zakon.kz 2015). However, the most decisive checkpoint for local executives is their performance evaluation by the president and central government (the Ministry of National Economy) in terms of implementation of state strategic objectives, decrees, laws, budget programs, public service delivery, and human resource management (Ibid.).

Before the Law of 2001, akims were in exclusive subordination to the president and had an autonomous position in relation to the government. This was contradictory to the Constitution of 1995 since government is an executive power and leads activities of all executive bodies. This also led to tension between the government and akims of regional level. Presently, after adoption of the Law, akims have double status: they are representatives of the president and the government.

Akims of regional (oblast) level, before Constitutional changes of 2007, were appointed by the president based on submission of the prime minister. Presently, as discussed, they are appointed by the president with approval of the regional representative body, maslikhat. Akims, and specifically regional akims, as political civil servants

(Emrich-Bakenova 2009), are moved frequently from region to region or to positions in central government which makes their interest in regional or local development questionable (OECD 2017).

Until Constitutional amendments of 1998, all akims of second and third tier were appointed by superior akims. Since 2001, appointments were made based on experimental indirect elections in selected small rayons and villages. Deputies of rayon level maslikhats were casting their votes for akims for a period of 2 and later 4 years. As employees of public administration, akims could not have their own real political platform. Already during the first election, 74% of the population preferred direct election of local executives (Ileuova et al. 2002; Echo 2013; Zakon.kz 2013; Nomad.su 2005; Makhmutova 2001).

The latest election of akims took place in 2017 based on general and, in some aspects, ambiguous rules. All the candidates for akim position are proposed by one official – akim of rayon. Maslikhat deputies of corresponding rayon (city) subsequently cast their votes. While candidacies of akims are discussed during the local self-government meetings, the peculiarities of conducting those meetings (see below) make the process a formality. Over 96% of maslikhat deputies of rayon level are members of Nur-Otan party. In 2017 election of akims, 96.1% elected akims are members of Nur-Otan. The other peculiar result of the 2017 election is that a majority of elected akims received 90% or 100% of candidate votes (Echo 2018). This absolute support had also been observed in the previous elections.

In 2018, the Ministry of Justice worked on the draft law that would introduce direct election of local akims with the right for advancement of candidates by the political parties. This change was supposed to facilitate improvement of law on election and streamline it with recommendations of international organizations (Kapital.kz 2018). However, the draft law failed in the senate, which decided to keep the status quo that is indirect election (Zakon.kz 2018).

Elections of akims in Kazakhstan have been under a high degree of control by central government. As a result, local akims essentially remain as its representatives rather than of local communities (Echo 2018; OECD 2017).

## Local Self-Government (LSG)

The development of local self-government in Kazakhstan has a long and difficult history (see Makhmutova 2001; Gabdualiyev 2015; Muminov n.d.; Chebotarev 2015). It could be argued that from 1995 to 2009, the LSG had been a symbolic ideal lacking stable Constitutional and legislative base. However, now that this hurdle has been bypassed, the present LSG's institutional elements are significantly intertwined and overlap with local public administration and are affected by the strong overarching role of local executives (akims).

### History of LSG

The Constitution of 1993 while determining that administrative territorial units are independent in their management of local affairs within the limits of the law, nevertheless did not contain reference to LSG as an institute of its own. Some experts argue that at the time full-fledged self-government with division of functions between state and LSG was not possible (Gabdualiyev 2015, 7). Kazakhstan was undergoing a period of transition where the role of the central state was unquestionable in preserving territorial integrity and political stability (Emrich-Bakenova 2009; Bhuiyan 2010; Makhmutova 2001).

In the Constitution of 1995, the concept of "local self-government" is mentioned in several Articles (7, 33, 61, 89). These constitutional references presume not only the existence of the LSG as an institution separate from public administration but also that its organization and activities are regulated by separately adopted law. Article 92 of the Constitution requires that laws mentioned in its text should be adopted no later than within 2 years after adoption of the Constitution itself. While the very first draft of the law on LSG was developed in time, subsequently it was sent multiple times for revision, then for discussion with oblast akims, heads of central, and other executive bodies (Muminov n.d.). Overall, the Ministry of Justice

delivered several drafts starting from 1996, 1997, 1999, 2002, 2006 (several drafts), and 2007. All the drafts were lacking legislative clarity and understanding of the nature of local self-government. One of the general deficiencies, in view of experts, was that the LSG was intended to be not as public body responsible for the local issues with its own representative and executive bodies, budget and property but as a voluntary organization of citizens (KIBHR 2010; Chebotarev 2015; Makhmutova 2001).

At the urging of the Constitutional Council of Kazakhstan that overlooks implementation of constitutional provisions, the Government proposed and Parliament finally agreed to rework the Law on Local Public Administration (2001) and subsequently, in 2009, adopted the Law on Local Public Administration and Self-Government (Gabdualiyev 2015; Constitutional Council 2008). The Law, however, was fragmented and contained only brief provisions related to LSG with the section that regulates "participation of citizens in local self-government" consisting of only six Articles. The Law lacked not only legal provisions of organization and activities of self-government, but also principles and state guarantees of their implementation (Aitkazinov 2010b).

In light of the presidential message Kazakhstan-2050 (President of the Republic of Kazakhstan 2012a), which emphasized a rational "educated" approach toward decentralization, and the policy *Concept of Development of Local Self-Government* (President of the Republic of Kazakhstan 2012b) that outlined concrete steps of LSG development in Kazakhstan, including increased role of population in decision-making of local significance, election of local akims, and financial independence of local levels, the Law went through multiple revisions, as mentioned earlier (Dosmyrza and Zhanuzakova 2017).

## Model of LSG

The Constitution (1995) Article 89 states that Kazakhstan recognizes LSG for *independent* resolution by the population of issues of local significance. LSG is executed by the population *directly* as well as through *maslikhats* and *other bodies* of local self-government in local communities on the territories with compactly populated groups. LSG could be the delegated functions of public administration. Independence of LSG authority is guaranteed within the limits of the law.

While the Constitution grants rights to the population independently to decide issues of local significance, the Law empowers not only maslikhats but also akims and akimats of all levels to be bodies of LSG.

Maslikhat simultaneously is a body of local public administration and the body through which the population gains self-government. Article 86 of the Constitution was not amended accordingly and continues to indicate that maslikhats are bodies of local public administration. Yet by giving to maslikhats the status of bodies of local self-government, the Law did not account for the fact that there are no maslikhats lower than district level.

Even though the Constitution (1995) does not mention local executive bodies among the actors of LSG, the Law clearly states that akims of all levels, like maslikhats, have dual functions of public administration and local self-government. How justifiable is the fact that lawmakers give local state executives the role of LSG in the Law? As some scholars argue, in the constitutional law, LSG reflects reality and not a utopian picture. Therefore, LSG develops from and is fully within the state system. Therefore, the Kazakh model of local authority has its logical continuation in practice and in theory (Gabdualiyev 2015, 62).

The Law presents self-government as separate from the state, as initiative of people in localities. At the same time, the Law outlines the relationship of maslikhats and akimats with bodies of local self-government and entrusts the former to create necessary conditions for LSG establishment and development.

Thus, as argued, as far as concerns legal institutionalization of other bodies of self-government for the development of municipal democracy in Kazakhstan, the principle law contains a "colossal potential" (Gabdualiyev 2015). In other words, the Law is evolving and those other bodies of LSG may still be in making.

The Law allows citizens, permanent residents and stateless persons to participate in LSG activities including the right to elect and be elected into its systems. Meanwhile, the Constitution (Article 33) and the law on Election identify only citizens as having the electoral right in Kazakhstan. Given that election to maslikhats could only be exercised by citizens of Kazakhstan but maslikhats have the dual role of local public administration and LSG bodies, there arises yet one more basis for concern related to political risks and national security (Gabdualiyev 2015).

The Law is vague regarding the authority of local self-government and that of public administration. In other words, the Law does not differentiate among functions and responsibilities of maslikhats and akimats which they are supposed to undertake as public administration bodies and as bodies of self – government. Lack of clear differentiation between "state affairs" and "affairs of self-government" as well as dual functions of akims and maslikhats is in essence a sign of legal conflict (Echo 2018; Aitkazinov 2010).

The Law also grants exclusive authority to local akims to closely oversee LSG meetings even for local initiatives. Meetings could be called by submission to the akim of an application signed by no less than 10% of the local population. The 10% requirement may become a problem given that in the cities of rayon significance and villages, population may comprise 10,000 and 2,000–3,000, respectively. In some instances, the population of villages could be even bigger, over 20,000–30,000 (Chebotarev 2015; Jaxylykov 2019).

Decisions adopted during the local gathering or meeting are subject yet again to obligatory consideration by local akims who have the right to disagree with the decision. If after the second round of discussions there is no consensus between the participants and akim, the issue is directed for review to maslikhat of rayon level (city of oblast significance) and subsequently for the final resolution to a higher ranking akim.

Even though a recent review of LSG meetings did not find a single case of an akim in disagreement with local community positions (Echo 2018), nevertheless the entire process that leads to the initiation of self-government meetings is extremely centralized, with local akims controlling the agenda items. What's more, the outcome of LSG meetings themselves are only considered as recommendations. The actual decision belongs to the local or higher ranking akim.

Thus, while the Law (Article 39–5) guarantees independence to the LSG, this independence is questionable. In other words, the independence of local self-government is limited by the provisions of the Law itself.

Quite sharply and succinctly, one Kazakhstani expert pointed out that Kazakh political elites searched and found the form of LSG *optimal for themselves*. They arrived to the unprecedented decision, practically without international analogies, by giving status of LSG to the bodies of local public administration, akims (akimats) and maslikhats (Chebotarev 2015) (For example, in the Constitution of Russian Federation (Article 12) local self-government is not part of the system of public administration (Gabdualiyev 2015, 39). According to the European Charter of Local Self-Government: "Local authorities shall, within the limits of the law, have full discretion to exercise their initiative with regard to any matter which is not excluded from their competence nor assigned to any other authority" (European Charter 1985, Article 4). The described model of LSG in Kazakhstan seemingly does not adhere to the European model because of the dual status of public administration bodies.). As a result, LSG not only in law but in practice is clearly a function of state administration and its local bodies.

## Economic and Financial Base of Local Government

To be able to exercise the granted powers and responsibilities, local governments should also have adequate economic support. The Law (Article 3) outlines the principle elements of economic and financial basis of local public administration and self-government. Those include:

- Local budget
- Communal property
- Other property in accordance with the law of Kazakhstan

We focus on issues related to local budget.

### Local Budget

Fiscal relations in Kazakhstan are framed by the Budget Code, which identifies a four-level system: republican, oblast, rayon, and village. Local budget includes all the levels below republican. In outlining fiscal relations between the levels, the Budget Code defines rigidly the scope of activities of local executives and the areas of their mandatory expenditures, including type of transfers and tax revenues. The autonomy of local governments is limited in terms of their ability to adjust allocations in accordance with local needs and budget possibilities (OECD 2017).

Local budget and republican budget are mainly formed by tax revenue. However, contrary to the republican budget, local budgets are formed also by the means of individual income tax, property tax, and some types of excise taxes. Altogether local budgets have 15 types of obligatory taxes and fees (Taibekuly 2015). Oblasts in Kazakhstan differ in the level of economic development, and the capacity to generate independent revenue streams through taxes or other means (OECD 2017; Bhuiyan 2010; Makhmutova 2006). Those regions that have high tax capacity (Almaty city, – 61%; Nur-Sultan, 39%; Mangistau oblast, 68%) (Taibekuly 2015), thus have high level of self-support from local budget and less dependency on transfers from the central state. These high capacity regions are also budgetary donors into the central budget. According to fiscal equalization policy, oblasts with greater capacity to generate revenue have had part of their income deducted and contributed to the national budget, whereas oblasts with lesser fiscal capacity receive a subvention from the central government. However, for partial offsetting of deductions, all oblasts, including those which contribute more to the national budget, are entitled to transfer payments (OECD 2017).

### LSG Budget

LSG budgeting was introduced into the Budget Code of Kazakhstan on a gradual basis only in 2018. Initially it included only 1062 rural districts with populations of over 2000 people. The plan is to introduce LSG budgeting across the country in 2020 (Ministry of Finance of the Republic of Kazakhstan 2018).

Revenue sources of the LSG budget consist of individual income tax, property tax, land tax, tax on transport, advertisement fees and other non-tax revenue sources such as fines imposed by local akims, voluntary contributions of citizens and legal entities, and revenue from rent of communal property.

Akims find the LSG budget insufficient. The review of LSGs pilot budget implementation indicates that only in a few districts do tax revenues cover 75 percent of budget expenditures. In more cases, revenues cover only 25 percent of expenditures (Echo 2018). The focus of central Government on budgetary transfers (discussed earlier) rewards already relatively well-off local communities. Those communities that are economically vulnerable face either liquidation or amalgamation, or reliance on whatever small LSG revenue they may collect.

Akims consulted with local communities in developing the 2018 pilot budget. However, this consultation was a formality. Control over developing and implementing the budget involved predominantly those LSG members who had been given these functions formally. A majority of local populations did not participate in the budget process (Ibid.).

## Conclusions

The review points out that Kazakhstan has developed its distinct national model of local government.

In Kazakhstan, regional and local territorial units are named as local governments. However, regional policy priorities overweigh local interests.

While the Constitution (1995) delineates between local public administration and local

self-government as distinct institutions, local representative and executive public administration bodies have dual overlapping role in being simultaneously organs of state administration and self-government. These arrangements lack clear differentiations between what constitute state and self-government affairs.

The review also points out that within the strict and complex system of checks which is imposed on the role and organization of self-government meetings and elections of local executives in lower tier, the institute of local self-government is nothing more than a function of central and local executives' priorities as opposed to grass-roots independence of local population.

While maslikhats as representative local body directly elected by population are the closest to a real full-fledged institution of local government and for that matter self-government, nevertheless, they fail to become such. Due to the dominance of local executives, maslikhats are the weakest and least significant institutions in Kazakhstan.

A rigid budgetary system that limits autonomy of local governments in their activities has been supplemented by an equally centralized model of village-level participatory budgeting. Like many other elements that define the relationship between tiers of government in Kazakhstan, there is a clear dominance of public administration executives acting on behalf of the central state over the economic base of LSG.

Within the developed national model of local government, status of the central state and its local executives continues to occupy an overwhelming number of positions in the development of the legal and fiscal spheres, their implementation, and control. Therefore, it could be concluded that local governments in Kazakhstan do not possess to a full extent those rights that are provided to them in the Constitution.
